

Psychological Warfare

David Childers

Greetings,

The ability to change perceptions through cognitive means can influence or change the outcome of realities for a crowd, group, or entire nation. The use of information dominance can modify the relative perceptions of a target audience and achieve specific goals without the use of force or traumatic impact.

It is essential to understand how these methods are used and can be applied to facilitate both changes and to avoid being subjected to the adverse effects of such operations.

David Childers

Introduction

Psychological Operations (PSYOPs) convey selected information and indicators to audiences to influence their emotions, motives, objective reasoning, and ultimately the behavior of governments, organizations, groups, and individuals.

These actions aim to induce or reinforce behavior favorable to specific objectives. They are an essential part of the range of diplomatic, informational, military, and economic activities of a country. These operations can be utilized during both peacetime and conflict.

Psychological Operations can encourage popular discontent with the opposition's leadership and, combining persuasion with a credible threat, degrade an adversary's ability to conduct or sustain military operations. They can also disrupt, confuse, and protract the adversary's decision-making process, undermining command and control. When properly employed, Psychological Operations have the potential to save the lives of friendly or enemy forces by reducing the adversary's will to fight. By lowering the adversary's morale and efficiency, Psychological Operations can also discourage aggressive actions by creating indifference within their ranks, ultimately leading to surrender.

The methods used for Psychological Operations include using various forms of printed media, broadcast multimedia (both Television and Radio), and content distributed using computer networks.

Dear Reader:

This product was prepared by the staff of the *Federal Research Division* of the *Library of Congress* under an interagency agreement with the sponsoring United States Government agency.

The Federal Research Division is the Library of Congress's primary fee-for-service research unit. At the request of Executive and Judicial branch agencies of the United States Government and on a cost-recovery basis, the Division prepares studies and reports, chronologies, bibliographies, foreign-language abstracts, and other tailored products in hard-copy and electronic media. The subjects researched include the broad spectrum of social sciences, physical sciences, and the humanities.

For additional information on obtaining the research and analytical services of the Federal Research Division, please call 202/707-9905, fax 202/707-9920, via Internet frd@mail.loc.gov, or write to *Marketing Coordinator, Federal Research Division, Library of Congress, Washington, DC 20540-5220*.

1. INTRODUCTION AND DEFINITIONS

"To subdue the enemy without fighting is the acme of skill."--
Sun Tzu, 4th century B.C.

Psychological operations, or PSYOP, is a form of political and military activity that is understood and defined in a number of different ways. The definition upon which current peacetime U.S. PSYOP policy is based was established in Department of Defense Directive S-3321.1, Overt Psychological Operations Conducted by the Military Services in Peacetime and in Contingencies Short of Declared War (1984). That definition states that Psychological Operations are "planned political, economic, military, and ideological activities directed toward foreign countries, organizations, and individuals in order to create emotions, attitudes, understandings, beliefs, or behavior favorable to the achievement of U.S. political and military objectives." The DoD directive was formulated to establish standard guidelines for all aspects of PSYOP (planning, programming, execution, control) conducted by agencies of the U.S. Department of Defense in non-wartime conditions. But PSYOP also includes a number of other activities that fall under strategic military and political policy. Activities of that type are defined in Joint Chiefs of Staff Publication 1 as: "planned psychological activities in peace and war, which normally pursue objectives to gain the support and cooperation of friendly and neutral countries and to reduce the will and the capacity of hostile or potentially hostile countries to wage war." The latter definition reflects the expansion in scope that has occurred in PSYOP in the last fifty years. In the modern world, the scope of PSYOP is wider than ever

before, even though the basic concepts continue as they have existed for thousands of years. Reflecting this expansion, PSYOP expert Fred W. Walker notes, "We might consider the term persuasive communications to mean the same thing as psychological operations."¹ Another expert, William Daugherty, prescribes an even broader field: "PSYOP is communication and therefore covers the entire field of human action."² In the present political-military meaning of the term, PSYOP is a multi-stage process that uses a combination of non-coercive devices to gain influence over the actions and attitudes of a targeted group without resorting to the use of force. The first stage of the process is defining the target, the second is finding methods or agents to influence the target's perception of reality, and the third is the output of the message through selected channels. In this process, the most critical element is credibility--to retain the attention of the audience, the audience must be convinced it is receiving information that is reliable and pertinent to its interests. If the audience detects contradictions or falsehoods, credibility is lost--for a particular operation, and perhaps for future operations as well. Therefore, the cardinal motto for all PSYOP applications is "Truth is the best PSYOP." The advantage of using PSYOP has remained the same throughout its history: if an opponent's attitude can be influenced favorably, his physical resistance will diminish. This means that, when used in combination with other military or political operations, PSYOP acts as a force multiplier, enhancing the effect of those operations on the target.

The term "psychological operations" was first used in reference to surrender messages (messages offering humane treatment for enemy

personnel ceasing to resist U.S. forces) sent to the Japanese mainland in 1945. From World War I until the 1960s, "psychological warfare" was the umbrella term in common use. In the 1960s, it was recognized that much more was included in the modern concept than warfare in the conventional sense, so PSYOP became the umbrella term. Psychological warfare, or PSYWAR, remains part of the PSYOP concept. It refers to activity seeking to influence the attitudes and actions of hostile foreign groups in support of national objectives in wartime.³ Psychological warfare is thus the type of psychological operation most closely connected with military actions: before and during engagement, to minimize the enemy will to fight, and afterwards, to underscore the impact of his losses and the hopelessness of his situation. Military actions themselves (the dropping of the atomic bomb, as an extreme example) may play a psychological role beyond their military impact, because the demonstrated ability to inflict harm has a psychological effect on the potential victim.

In the twentieth century, PSYOP applications have been broadened by the intense ideologies and systems of mass communications that have supported them since World War I. Particularly since the 1930s, the connection of PSYOP with ideology and mass communication has made it a constant strategic element of international politics. Communism and Fascism have used PSYOP in new ways, still considered unethical by much of the world, and forced the opponents of their ideologies to rethink their PSYOP procedures accordingly. The concepts of "disinformation" and "active measures" have been added to the

international PSYOP vocabulary, and the definition of "propaganda" has been expanded in this process.

Disinformation, translated from the Russian term dezinformatsiya, has been defined as "any government-sponsored communication in which deliberately misleading information is passed to targeted individuals, groups, or governments with the purpose of influencing foreign elite or public opinion." Disinformation differs from propaganda because the latter does not necessarily involve deceiving a target group, and because disinformation always has a specific foreign target.⁴ "Active measures" is a translation of an umbrella Soviet term, aktivnyye meropriyatiya. It has come into English usage because our term "covert activities" does not cover the enormous breadth of activities and participants included in the Soviet concept. In addition to using conventional covert operations, active measures seek to acquire influence over an opponent's attitudes through the media, economic leverage, front organizations, and other seemingly innocent overt agencies with covert sponsorship.⁵ The goal of active measures can be summarized as political influence and disruption on an international scale, to achieve a specific result. Both disinformation and active measures are weapons in what Communist dogma sees as peacetime psychological warfare. That warfare is an extension of the international military goals of the Communist movement. Those weapons will be discussed more fully in the Soviet PSYOP section of this survey. But it is important to note that these types of PSYOP have been added only to the Soviet arsenal. While the U.S. must respond effectively to them, it remains committed to the principle of truth in all information programs.

"Propaganda" is a broad term that means management of collective attitudes through communications and symbols, for the purpose of promoting or damaging a cause.⁶ Among its non-PSYOP applications are commercial advertising, political campaigning, and religious exhortation. (The term was invented by the Roman Catholic Church in its seventeenth-century campaigns against Protestantism.) But in the contemporary public understanding, those aspects have been overshadowed by the widespread political uses of propaganda in the twentieth century. Although the term had become associated with untruth, propaganda in the PSYOP context must contain large amounts of true information, because of the primary requirement that the audience believe the message. By convention, PSYOP propaganda is divided into three types: white, gray, and black. White propaganda originates from a correctly identified source, black from a completely misidentified source; the source of gray propaganda is masked by transmission through a "front" agency that is nominally independent of the actual source.

"Symbolic propaganda" uses action rather than words to produce its effect. The most dramatic example of symbolic propaganda was the use of the atomic bomb in World War II to physically demonstrate the hopelessness of the Japanese position. Several years later, the first Soviet nuclear test sent a symbolic message that had a strong psychological effect on the West.

PSYOP relies heavily on correct evaluation and exploitation of the target's "capacity for self-deception."⁷ What is this "capacity for self-deception," and how is it exploited? Approaches differ according to specific conditions, because target groups vary widely. Examples of such

target groups are military enemies, political rivals, indigenous populations in guerrilla and counterinsurgency operations, and domestic populations whose support is needed for military or political campaigns. Every identifiable group, society, and nation has a unique set of needs and goals, as well as a uniquely shaped group psychology. The needs and goals may be long- or short-term, military or political, real or imaginary. To cite two extreme examples, the group psychology may be shared by a small group in a short-term, tactical situation (such as a military unit occupying foreign territory), or by several nations in a semi-permanent, strategic situation (such as a group of nations strategically located between two superpowers). Between those extremes are many combinations of needs and goals. If a psychological operation is done properly, the perceptions formed by the target group can be slanted in a particular direction without immediate challenge and actions or attitudes changed accordingly. Psychological operations thus can reduce the risk and expense of coercive action. Such operations are especially useful to groups such as guerrilla forces whose capacity for coercive action is limited. PSYOPs is not to be confused with military deception, which causes an enemy to take inappropriate action by misleading his assessment of positions or intentions.

For the operating side, the immediate target is a weak point of an ultimate target, a place where psychological advantage can be gained and used as a weapon in the longer term. How would this work in the two examples given above? For an occupying force, the points of psychological vulnerability might be distance from home and prolonged exposure to an uncomfortable cultural environment. In such a case, if

the opponent's intelligence reveals discontent within the force, a psychological operation might use communications media to convince group members of the loneliness and pointlessness of their venture, and to offer easy surrender conditions. If such a message penetrates without effective challenge, it blunts the effectiveness of the occupation. This approach might be accompanied by terrorists acts that "emphasize" the alienation of the occupiers.

In the international example, smaller nations are subjected to constant superpower propaganda. The Soviet Union uses overt and covert measures in campaigns to split smaller countries from the United States and move them toward a neutral position. In Europe such efforts exploit the substantial public and official desire for peace and security, doubts about American resolve to defend Europe, and fears of nuclear war. A campaign of this sort continues over many years and is woven into the fabric of superpower foreign policy.

In modern times nations increasingly understand the need for propaganda to justify their positions to both domestic and foreign audiences. In peacetime and in protracted war, PSYOP procedures now are integrated with and parallel to measures of military preparedness. Key factors in their success are accurate evaluation of adversary psychology, secrecy, and the output of information that is consistent and credible.

A PSYOP application of particular current value is in insurgency and counterinsurgency activity in what is called "low-intensity conflict" (LIC). Geographically confined to the Third World, LIC PSYOP now is often used in confrontations of client groups of larger powers such as

Soviet Union, China, and the United States. Such confrontations occur most often in areas with weak governments, poorly developed or unbalanced economies, and valuable natural resources or strategic location.⁸ In recent years, El Salvador, Cambodia, and Afghanistan have been the sites of major superpower insurgency-counterinsurgency efforts. The U.S. has been on both sides of such campaigns, aiding counterinsurgency in El Salvador and the Philippines, insurgency in Nicaragua and Angola. Because guerrilla warfare relies heavily on psychological impact to complement sheer force, successful counterinsurgency must use PSYOP effectively to defeat such campaigns. Victory goes to the side that best understands and exploits the psychology of the indigenous population that is the main source of support for the guerrillas. As insurgency and counterinsurgency have developed, important PSYOP tools are community relations programs, public information, and civic action programs carried out by military personnel in the areas in dispute. Insurgency PSYOP is not limited to proxy confrontations between the United States and Soviet camps. The Ayatollah Khomeini conducted a very effective insurgency against the Iranian government. Exploiting religious fervor and dissatisfaction with the government, the exiled Khomeini smuggled large numbers of tape cassettes into Iran, spreading propaganda to stir revolutionary feeling and build a movement from an initially small number of followers.⁹ In this case, no effective counterinsurgency campaign was mounted, and the government fell.

In the contemporary world, unconventional warfare is the rule, not the exception. Given that fact, PSYOP has become a military tool of

greater importance than it was in the "classic" model. This is because the element of psychology is present in all forms and levels of combat, even when some conventional aspects of doctrine become less relevant. When the clear boundaries of open combat disappear and civilian populations become an integral part of every confrontation, PSYOP no longer is a specialized, sinister weapon that can be disregarded because it does not yield spectacular results. Proper PSYOP procedure is often a critical guarantee of success; solid PSYOP approaches to an indigenous population can hold territory with minimal expense or loss of life. But under such circumstances, the PSYOP weapons must be as familiar as any other weapon to all military personnel, because it is they who carry out PSYOP in their everyday contact with the population. In places such as El Salvador, the psychological relationship between military personnel and the civilian population is a prime determinant of the government's success against guerrillas; in this case, U.S. advisers are training the host nation's forces in PSYOP applications. A key word is "integration" of PSYOP into the framework of conventional military doctrine.

Another important application of PSYOP is to rally a domestic population behind a political or military cause. In wartime all nations, whatever their political system, must inspire willing sacrifice by their people. All U.S. war efforts, from the American Revolution to Vietnam, have required extensive "selling." As Korea and Vietnam showed, the complex psychology of a democracy is not always receptive to such campaigns. In such cases, targeted propaganda is the most important tool, but covert active measures have also been useful for totalitarian governments in combating uncooperative internal elements.

The historical examples that follow will show the variety of goals, methods, agents, and target groups that have been included in psychological operations of the past. In the sections that follow, discussion of past and current Soviet PSYOP will show how that nation has refined and expanded the entire field to meet the ideological requirements of the Leninist state. And discussion of United States PSYOP, past and present, will focus on the response to Soviet PSYOP campaigns from World War II to the present, in what has become the most massive PSYOP battle in history.

2. PSYOP APPLICATIONS IN HISTORY

The Art of War, a treatise written by the Chinese military thinker Sun Tzu in the fourth century B.C., advocates the idea that an army of superior numbers can be "made not to fight." This idea was in use even before that time. An early example is the slaying of Holofernes, leader of an Assyrian force invading ancient Israel, by the Israelite Judith. Knowing that enemy troop morale depended heavily on the single figure of the commander, Judith gained the confidence of Holofernes, beheaded him, and carried the head back to her people. The symbolism of the missing head and the lost command figure totally demoralized the Assyrians, who were easily routed in spite of vastly superior numbers. The story appears in the apocryphal Biblical Book of Judith; its historical accuracy is unproven, but it remains a good example of assessing the enemy's psychological weak point and using a powerful psychological symbol to bolster the morale of one's own forces.¹⁰

In another example, Ghengis Khan is credited with leading huge hordes of savage horsemen across Russia and into Europe. The size of his armies was exaggerated by agents planted in advance of the army and by rumor and other forms of propaganda. To supplement his PSYOP activities, Ghengis Khan also used rapid troop maneuver to confirm the illusion of invincible numbers. Because the Mongols created an image of total, barbaric domination, target groups never believed they were the victims of astute psychological warfare. Once the image had spread, the Mongols had created a permanent weakness in enemy psychology, and thus gained a military advantage wherever the Mongol reputation was known.¹¹

In another instance, during the American Revolution the rebels distributed propaganda leaflets that invited Hessian mercenaries and British common soldiers to desert. One such leaflet provided two short, contrasting lists: the negatives of life in the British Army and the advantages of deserting and settling permanently in America. Promises of leniency and surrender passes have become a staple of battlefield PSYOP. In the Revolutionary War application, the direct appeal exploited the mentality of the occupying force, class differences between officers and enlisted men, and nationality differences between the British and their German mercenaries. Thousands of troops heeded the appeal and never returned to Europe. At the same time, domestic loyalist opposition was muffled by anti-British propaganda in the newspapers of the thirteen colonies.¹²

A qualitative change occurred in PSYOP about 1900, when communications became much faster and more inclusive. For the first time, entire nations could be targeted in a psychological operation by

print, radio, and film. These media provided direct, reliable transmission of propaganda messages to anyone within sight or earshot. The new media were first used widely in World War I; the British used them to spread rumors of German atrocities, including cannibalism.¹³ Because the British had already developed a more sophisticated print and communications system than the Germans, they mounted a propaganda campaign that the Germans could not overcome. The British diplomatic service was also more adept at public diplomacy than its German equivalent. The British used German propaganda ineptitude to their advantage by simply disseminating many undiplomatic German statements, without change or comment; the difference in PSYOP skill between the two sides was enough to make the message clear that the Germans were uncivilized, arrogant "Huns" (a term used by the Kaiser himself for his army). German morale was deflated by having bombastic public statements made into ammunition for the enemy. This propaganda defeat was an important incentive for better performance by German propagandists in the next war.

Because of the expanded scale on which it was used, PSYOP is considered by historians as a crucial factor in the Allied victory in World War I. The Creel Committee, the first specialized U.S. agency for wartime propaganda, succeeded in building domestic support for a war that was not popular initially; it also was the model for later U.S. publicity and propaganda agencies. And the very presence of the U.S. in the war, after long neutrality, had great psychological as well as the military impact. Early in 1917, Germany began sinking all ships approaching Britain, in order to starve the British into surrender. The

Germans assumed that Britain would surrender before the U.S. could retaliate for its sunken ships by entering the war on Britain's side; when the error of this gamble became obvious, German morale fell. The German General Ludendorff named allied PSYOP the most important factor in German morale decline.

Before and during World War II, the Nazis used a propaganda machine aimed first at domestic opinion, then at world opinion. The basic psychological assumption of that machine was that public opinion is formed by symbols and images, not rational thought. If the correct symbols were presented with enough force, the public would follow. The theory worked because the audiences chosen were prone to self-deception about certain emotional topics. The charismatic figure of Adolph Hitler provided the ultimate symbol of renewed power to a nation humiliated by the results of World War I. The propaganda machine of Joseph Goebbels convinced Germans and many audiences elsewhere that Communists and Jews were the enemies; that only Fascism could provide protection from them; and that the advance of Fascism was both just and inevitable.¹⁴ The worldwide desire for peace provided a psychological weak point that prevented rational evaluation of these messages; British and United States opposition was delayed until Europe had been conquered piecemeal. By that stage, Germany had developed effective print and broadcast media. A much older form of propaganda dissemination, the mass rally, was also used very profitably. The Germans also made extensive use of "black propaganda" and subversive pro-Nazi groups and agents in occupied territory.

After World War II, the Soviet Union raised peacetime PSYOP to new levels of sophistication as the Cold War broke out. And, as new international political conditions developed, tactical military PSYOP began to play a new role. These activities will be the subject of the following sections.

3. SOVIET PSYOP

Like other aspects of Soviet policy, the Soviet theory of psychological operations is based on the teachings of Lenin. The central concept (which sharply differentiates Soviet from United States approaches to the subject) is that the Soviet Union is in a state of undeclared war with capitalist world--a war that will not end until world Communist domination is achieved. Given the magnitude of the goal, moral constraints have had much less influence on Soviet PSYOP than on those of the United States and other countries. In the words of covert operations specialist Chapman Pincher, for the Soviet Union "politics is the continuation of war by other means."¹⁵ On the peacetime strategic level, politics is the main arena of Soviet PSYOP. However, this approach was not invented by the Bolsheviks in 1917; it was used sporadically for centuries by the Russian tsars in domestic and foreign relations, but it has been codified and intensified in the last seven decades. Soviet PSYOP is by far the most intensive, complex and consistent peacetime campaign of its type ever launched. The Soviet political system backs its PSYOP policy with whatever resources are necessary to achieve its goals.

Soviet PSYOP campaigns are a tightly integrated combination of conventional devices, influential "legitimate" institutions such as the diplomatic corps and the press, and covert activities. On the level of open propaganda, the goal is to "out-talk" the adversary, establishing terms of international dialogue favorable to the Soviet Union. This process is constant, aimed at wearing down the West and convincing other listeners that the Soviet position is valid. A favorite message in the Soviet arsenal says that it is the West that is on the psychological offensive: with an insatiable ideological drive, imperialism uses all possible psychological means to undermine the progressive development of other nations toward the ideal, inevitable Communist order. Furthermore, Dmitri Volkogonov, the leading Soviet PSYOP theoretician, says that the imperialist powers invented psychological warfare to maintain world domination.¹⁶ Briefly stated, his view is that imperialist PSYOP seeks to divide the communist world, disorient its people politically, and falsely portray the Soviet Union as the main threat to world peace. Volkogonov attributes virtually all the known Soviet active measures methodology to the United States and its imperialist allies. To the extent that this idea is believed around the world, Soviet PSYOP succeeds in putting the debate into its terms.

Three departments of the Soviet government supervise active measures and propaganda activities. The International Department of the Communist Party of the Soviet Union provides liaison with nonruling Communist parties and front organizations abroad, directs their active measures, and apportions responsibility for various types of activity. This department also suggests new measures to advance the international

policies of the ruling Politburo. Overall foreign policy is often affected by activities of the International Department (I.D.), which has no equivalent in Western governments.¹⁷ The functions of this agency appear to have been expanded and refined in recent years, especially after the abolishment of the party's International Information Department. A key figure in this development was Anatoli Dobrynin, former Ambassador to the U.S. and head of the I.D. until late 1988. The latter was in charge of the overall propaganda apparatus until 1986, when that function was split between the I.D. and a second major agency, the Propaganda Department. The latter now runs all domestic and foreign propaganda efforts. Its level of sophistication rose especially fast under Aleksandr Yakovlev, who until reassigned late in 1988 was an effective domestic and international spokesman for the Gorbachev reforms.¹⁸ The third propaganda agency is the KGB, or Committee for State Security, which handles espionage and disinformation activities at home and abroad. The disinformation mission aims mainly at destabilizing and misleading the NATO alliance and Japan, while concealing actual Soviet policy aims. In addition to the three major agencies, the Ministry of Foreign Affairs has broad responsibility for the overt Soviet press and foreign cultural relations--which in the Soviet system are closely coordinated with less "legitimate" PSYOP functions.

Although government reform has changed some of the structure of this system, there is evidence that even more resources are now allocated to PSYOP activities. History has shown that active measures are emphasized in times of improved relations with the West because targets become more vulnerable in such times.¹⁹

Favorite covert devices of Soviet active measures are forged documents and planted media stories, surfacing in forms that erode the position of the ultimate target. Often, forged United States and NATO documents are used to show that the West is intent on aggression in Europe or the Third World. Active measures aim to divide the target group (most often NATO) by intensifying latent hostilities within it. Germany is a favorite target for such divisive methods because the Nazi past remains a psychological weak point for all of Europe. Print and broadcast media are nearly always used to achieve maximum dissemination of a message. The procedure is to identify a potentially sympathetic audience with political influence (for example, the leftist West German Green Party and the Labor Party in Great Britain), and tailor the message for maximum favor with that audience.²⁰ In recent years, this tailoring includes maximum exposure of the terms perestroika (restructuring) and glasnost (openness), which for the Western audience indicate that hoped-for Soviet internal reforms are taking place and Cold War tension is easing. Debate flourishes on the actuality of those reforms, but there is no doubt that the terminology used to describe them has been quite successful in exploiting a Western psychological preoccupation.

A variety of agencies--from individual covert agents to client nations--carry out Soviet psychological operations. In the Third World, Cuba is an especially active agent, working on Soviet operations and independently. A major front organization for Soviet operations is the Helsinki-based World Peace Council. That organization, indirectly controlled by the Communist Party of the Soviet Union, plays a major role in stirring anti-NATO feeling in Europe. Political influence

operations are a special type of active measure, using personal contacts to advance a Soviet position in foreign decisionmaking institutions. These contacts range from foreign figures (diplomats, journalists, scientists) to KGB agents "planted" in positions of influence.²¹ Because the Soviet Union is the initiator, it has been able to choose its "battlefields," where chances of achieving psychological influence are greatest and opponents can be put on the defensive. In target countries, such campaigns exploit weak points such as ethnic rivalries, distrust of existing social or government systems, and class antagonism. And active measures are always used in conjunction with other devices to advance Soviet foreign policy goals.

A few examples of Soviet active measures will demonstrate their goals and methods. In 1976, a testament of Zhou En-lai surfaced in a prominent Japanese newspaper. The document spoke against the Cultural Revolution in China and advocated closer relations with the Soviet Union. It had been placed by the KGB office in Tokyo.²² In another instance, the KGB created a pamphlet, entitled CIA Insider, purported to be a listing of CIA agents and press outlets all over the world. The pamphlet, released in Switzerland, attempted to show the pervasive CIA influence in the Western press; it is an example of the "upside-down" black propaganda ploy of attributing Soviet PSYOP methods to Western nations.²³ And in the early 1960s, a long series of items planted in the European press ruined the political career of Franz-Josef Strauss, a staunch advocate of United States armaments in West Germany. Strauss was painted as a warmonger seeking revenge on the Soviet Union for the results of World War II.²⁴ In another example, in 1979, Radio Ba Yi

began broadcasting into China from the Soviet Far East. Its positions on domestic, diplomatic and military issues aimed initially at discrediting Deng Xiaoping, who was also attacked directly by the station. The Soviet Union acknowledged no role in the broadcasts, which supported all Soviet positions and advocate closer Sino-Soviet relations.²⁵ In the recent Soviet effort for better relations with China, the station was shut down.

The Soviet Union has also found itself on the negative side of PSYOP activities. When it invaded Afghanistan, counterinsurgency efforts failed to win over the indigenous population, and the occupying force became demoralized by guerrilla psychological warfare. And in 1983 the Soviet Union shot down a Korean civilian airliner, causing an uproar in world opinion. The Soviets tried to turn press attention "upside-down" by claiming that the United States had provoked the incident--but Soviet statements were poorly coordinated and contradictory, and they failed to win the battle of world opinion.²⁶ The obvious fabrications and confusion in the propaganda line violated the basic principle that information used in PSYOP must be believable to the target group.

Historically, Soviet active measures have had several weaknesses. The Soviet ideology of atheism and Communism is unattractive to many audiences, so it must be concealed or glossed over in many cases. Acts such as the Afghan invasion have eroded trust in the Soviet Union as defender of Third-World liberty. And many forgeries and press placements have been poorly executed and very obvious.²⁷

Most experts on the Soviet Union agree that in recent years the sophistication of Soviet propaganda and active measures has grown, and some of their weaknesses have been eliminated. First, the Soviet Union

now has a charismatic leader in the person of Mikhail Gorbachev. This is a weapon the Soviets have never had before. Gorbachev is able to send direct, credible messages to world leaders and use international media to propagate a view of the Soviet Union as a reformed, peace-loving, and benign nation. Like Roosevelt, he has cultivated a personal image of honest and moral humanity that has universal appeal. Following the cardinal principle of PSYOP, that all messages be based in truth, Gorbachev's messages utilize the actual liberalization of internal and external Soviet policy (highlighting such events as removal of Soviet tanks from Hungary and the liberation of Andrei Sakharov) to maximum effect in shaping the new image. Arms control proposals, slipshod and obviously insincere under previous regimes, now impress even Western skeptics with their scope and consistency. Gorbachev has also shown wisdom in choosing and shaping his messages to target audiences, alternating between firmness and conciliation. At the same time, there is strong evidence of continued commitment to Lenin's principle of all-out political war as an extension of military struggle in peacetime. A 1988 report of the United States Information Agency lists major active-measures "black" programs begun after Gorbachev came to power. Among the messages widely disseminated by these programs: the AIDS virus was created in an American laboratory for germ warfare; the United States developed a weapon that kills only non-whites; Latin American babies are butchered and sold to U.S. distributors for use in medical transplants; and the CIA murdered Swedish Prime Minister Olaf Palme. While such messages have not changed substantially since earlier years, the approach of more subtle, "gray" programs has changed. Soviet-controlled

international peace groups now seek a broader appeal by softening their rhetoric; other Soviet-influenced groups now seek wide contact with Westerners, to subtly convince them that Soviet positions are just; and the Soviets now sponsor many international peace forums, including respected professional figures, to enhance their peace-loving image. All these efforts complement the statements and actions of Gorbachev, whose programs of glasnost and perestroika seem committed to greater Soviet openness and nonmilitary programs.²⁸

In summary, the Soviet Union is by far the largest practitioner of PSYOP in the world. PSYOP has been an integral part of its foreign and domestic policy since the Bolshevik Revolution. In organizational structure and function, Soviet psychological operations overlap the more conventional functions of government and diplomatic institutions. Because PSYOP is still viewed as another version of military struggle, coordination of tactical military doctrine with long-term strategic-international goals remains especially close and consistent.

4. UNITED STATES PSYOP

In the "age of communications," all nations must find ways to "explain themselves" to the rest of the world, and to their domestic populations. The more international obligations the nation has, the more vital is the process of sending messages that create desirable psychological responses in their recipients. As described in the previous section, the United States faces a sustained, multilevel Soviet PSYOP

campaign. The campaign aims to discredit the United States and its allies in the view of the world and of their own populations.

Since mass communications became a PSYOP tool, the United States has been involved in several wars requiring domestic and international justification of its position versus adversaries such as the Germans, the Japanese, the Koreans and Chinese, and the Viet Cong. In each conflict, large-scale tactical PSYOP machinery also went into motion. Generally, such efforts have been a response to the initiative of an opponent; neither strategic nor tactical PSYOP apparatus has been at adequate strength before the threat appeared. And since World War II, moral and bureaucratic questions have interfered with coordination of PSYOP programs. As the definition of the word "war" becomes less clear, domestic perceptions of military and political goals become more vulnerable to psychological targeting by adversaries. This was seen most dramatically in Vietnam, but it also applies to current low-intensity conflict situations.

In World War II, a very effective PSYOP weapon of the United States was the charismatic leadership of Franklin Roosevelt, whose inspirational radio broadcasts were admired by Joseph Goebbels, Hitler's propaganda chief.²⁸ The United States created two major agencies for PSYOP activities in the war: the Office of War Information (OWI, for domestic and foreign propaganda), and the Office of Strategic Services (OSS, among whose functions was direction of military PSYOP). The OWI consolidated a number of information agencies that existed before the war. Wartime urgency did not prevent friction between the two agencies, congressional interference, and diffusion of PSYOP and

propaganda decisionmaking among theater commanders of the Army and Navy--factors that hindered PSYOP missions in many cases.²⁹ But the propaganda of the OWI was marked by careful evaluation of target psychology, appropriate messages, and effective delivery. For example, the OWI aimed surrender appeals at the psychological vulnerabilities of fanatical Japanese soldiers, inducing large numbers to surrender in spite of a military code that seemingly precluded such behavior.³⁰ Although the United States PSYOP effort in World War II was somewhat cumbersome and disorganized, there were enough instances of such astute targeting to overcome the head start that the Axis powers had gained in propaganda.³¹

After the war, the word "propaganda" was associated in the United States with Fascism and Communism, the systems that had "reinvented" the device for their ideological advancement. The American public did not consider propaganda an activity to be pursued in peacetime by the leader of the free world. There followed a period of indecision about the role of PSYOP in peacetime, and most wartime PSYOP units were disbanded shortly after the war ended. When the Korean War began, only one operational psychological warfare troop unit existed. As in the previous war, a strong PSYOP effort was eventually mounted in Korea, offering mainly radio, loudspeaker, and leaflet support of conventional ground troops. But complaints of weak support often came from the PSYOP units at the front.³² The Korean War was the stimulus for formation in 1951 of the Office of the Chief of Psychological Warfare (the first centralized agency for PSYOP) and the Psychological Warfare Center at Fort Bragg in 1952. The former no longer exists, but the

latter is now the center of PSYOP training and research for all the Armed Forces. In 1953 the United States Information Agency (USIA) was created for international dissemination of information.

In general, withdrawal from PSYOP activity after World War II was slowed by the realization that the Soviet Union was now a formidable enemy in the Cold War. This realization was based on two ideas: that the world does not automatically understand or approve of the United States; and that the Soviet Union is ready and able to exploit doubts about the morality and motives of the United States, in numerous overt and covert ways. An initial reaction to this situation was creation of the Central Intelligence Agency in 1946, with authority for covert psychological and political activities. The size and scope of this organization grew very fast during the Korean War.³³

Beginning about 1960, Communist expansionist doctrine has sought to exploit "wars of liberation" and insurgencies in areas previously under European colonial control. Soviet propaganda has portrayed the Soviet Union as defender of oppressed peoples, and the United States as an exploiting imperialist.³⁴ To meet this potent psychological gambit of guerrilla war, U.S. PSYOP applications in influencing the Third World and conducting unconventional warfare have become increasingly important in recent years.

How successful has the United States been in meeting postwar PSYOP challenges? The record has been mixed. A number of systemic differences prevent United States PSYOP from ever being the all-pervasive, centralized extension of foreign policy that it is for the Soviet Union. In the United States, all information cannot be officially

controlled; secrecy is difficult even in the most critical cases; and decisionmaking always involves a number of conflicting views. The Soviet Ministry of Foreign Affairs is mobilized for propaganda activities that the United States State Department could never undertake. Likewise, no American institution has the total control exercised by the Communist Party of the Soviet Union.

The Vietnam War was the most recent large-scale PSYOP campaign of the United States. As in Korea, the main tactical devices were loudspeakers, leaflets, and radio. The Chien-Hoi (Open Arms) amnesty program stressed the strength of the South Vietnamese Army and the hopelessness of the Viet Cong position. In many respects, this massive effort fell short on both strategic and tactical levels: the first when domestic and international doubts about legitimacy were not met by United States official information, the second when PSYOP and military operations failed to complement each other, and the enemy was able to exploit the psychological vulnerabilities of both United States troops and the indigenous population of Vietnam.

However, a number of post-Korea United States psychological operations have been successful. In 1965, American troops invaded the Dominican Republic to quell what was believed to be the first stage of a Castro-type revolution. During the American presence, liaison between military and civilian PSYOP groups was quite successful in supporting the military and political aims of the occupation.³⁵ According to verbal reports of participants, leaflets became such a valuable source of information that they were eagerly purchased in the capital city of Santo Domingo. In the Vietnam War, the Civilian Operations and Revolutionary

Development Support centralized and focused counterinsurgency targeting of indigenous populations in some areas.³⁶ The Joint U.S. Public Affairs Office (JUSPAO), founded to integrate public information and PSYOP functions in Vietnam, achieved a number of successes. CounterPSYOPs activity in Europe in the early 1980s ensured timely installation of intermediate-range missiles, despite an intensive Soviet psychological campaign to exploit European peace and antinuclear groups. And in the Grenada invasion of 1983, U.S. amnesty messages and rewards substantially reduced the opposing force.

After Vietnam, overall budgetary support for PSYOP declined. Army PSYOP units in Okinawa, Panama, and Germany were disbanded. This left the 4th Psychological Operations Group (consisting of four battalions in 1988) at Ft. Bragg as the only active-duty unit in the United States Armed Forces with an exclusively PSYOP mission.³⁷ A National Guard unit remained in the Air Force and support units remained in the Navy, but Ft. Bragg became the source of PSYOP support for all types of military operations. If medium- and high-intensity conflict should break out, support would come from a reserve PSYOP unit trained at Ft. Bragg. In peacetime, the active-duty unit builds the research base for future readiness, and it has the mission of PSYOP support for low-intensity conflicts and peacetime overt activities.³⁸ Because the latter type of support has growing potential for application, a number of leading PSYOP authorities have agreed that United States capability needs to be expanded, and that PSYOP expertise should be integrated into standard U.S. military training. This group includes Alfred Paddock, formerly commander of the 4th Psychological Operations Group and director of

psychological operations in the Pentagon; Melvin Kriesel and Michael Totten, former commanders of the 4th Psychological Operations Group; and Sam Sarkesian, professor of political science and former chairman of the Inter-University Seminar on Armed Forces and Society.³⁹

Since the Reagan Administration put additional emphasis on information as one of the elements of national power, overt psychological operations in peacetime have been increased. These psychological operations have included training and advice to indigenous forces allied with the United States, surveys and assessments leading to actual operations, miscellaneous support to host nation PSYOP programs, and other overt PSYOP projects. Typical of PSYOP support to host nation programs is the long-term program created for El Salvador. One trainer is assigned to the U.S. military group in the capital, San Salvador, to coordinate all U.S. PSYOP programs in the country. Over the years the U.S. PSYOP contribution has resulted in significant change not only in the PSYOP practices of the El Salvadoran Armed Forces, but also in their general approach to insurgency, including an increased respect for human rights.

Programs similar to the El Salvadoran project exist worldwide, as established by DoD Directive S-3321.1. This directive requires every Unified and Specified Commander-in-Chief to conduct overt psychological operations in peacetime as appropriate to the military mission.

Overt psychological operations are coordinated with the State Department and require Country Team approval for each operation. The operations are coordinated with the United States Information Agency (USIA) to prevent dissemination of conflicting information. DoD

operations attempt to fill the informational niches not filled by other agencies, dealing with subjects and areas of primary DoD concern but of secondary importance to the other information agencies.

At the strategic level, covert psychological activities are centralized in the Central Intelligence Agency, the latitude of whose operations has varied with the degree of oversight exercised by Congress. Meanwhile, overt propaganda is less centralized, and it is isolated from covert activity. In the 1980s, the United States has sought to bolster programs of cultural relations and positive image-making abroad. "Public diplomacy" has been used much more aggressively to correct the record about United States intentions and in counterattacking Soviet and Cuban propaganda. In 1983 a Special Planning Group was formed, including representatives from all government agencies having propaganda functions. The goal of this group was to centralize the public diplomacy effort and put forth a coherent, positive international image. The USIA has been instrumental in several specific improvements: coordinating United States explanations of Central American policy; ensuring INF installation in Europe; and increasing the budget for cultural relations and propaganda.⁴⁰ An interagency committee for public diplomacy, first used in the INF European campaign, continues low-key, behind-the-scenes coordination of policy statements and explanations.

But policy agencies still lack coordination with public diplomacy efforts; agency roles in PSYOP are not well defined; and the United States has often found itself in a reactive position in international situations requiring PSYOP applications. Because of agency

compartmentalization, messages often lack the crucial element of credibility because they are contradictory. And, in the words of Army intelligence officer and scholar John Oseth, there is an "American suspicion of the tools of psychological manipulation,"⁴¹ which insulates American institutions from association with such activities. On the military side, this takes the form of suspicion toward peacetime support of elite, special-purpose groups, such as those that would be given exclusively PSYOP missions.

A number of separate United States agencies now disseminate propaganda worldwide. The United States Information Agency runs the Voice of America and various cultural and information programs abroad. The Board for International Broadcasting runs Radio Free Europe and Radio Liberty, which broadcast into the Soviet bloc. And the Central Intelligence Agency continues its administration of covert PSYOP and counterPSYOPs activities abroad. DoD peacetime overt PSYOP activities have joined these groups in disseminating international information. Like the USIA, DoD disseminates international information only to foreign groups overseas.

As a result of governmental recognition of PSYOP deficiencies, in 1985 the Secretary of Defense promulgated a Master Plan to revitalize PSYOP. This plan reviewed the considerable inadequacies of PSYOP at that time, and recommended remedies for each item. Responsibility for DoD policy was given to the Under Secretary of Defense for Policy, which in turn created a Directorate for Psychological Operations assigned to the Deputy Under Secretary for Policy. This directorate was to be responsible for PSYOP policy and monitor response to the Master Plan.

The active duty PSYOP group was fully manned for the first time in years, and modernized equipment of all types replaced the Korean War-vintage radios, presses, and loudspeakers of the PSYOP units. PSYOP education and training were greatly improved, with a new Army functional area code assigned for PSYOP officers, and an enlisted military specialty was created. New awareness and staff training courses were created, to provide officers and enlisted personnel to meet a new demand for competent staff personnel. PSYOP staffs at all levels were created and strengthened, and they were moved out from under control of special operations staffs. The PSYOP Worldwatch Program was created, as a new, proactive body at the Joint Staff level, monitoring daily intelligence and open-source traffic for situations in which PSYOP input is appropriate. Similar bodies were created at the Unified and Specified Commands, adding a new element of proactive PSYOP to replace the traditional U.S. reactive posture. The Secretary of Defense assigned PSYOP forces to the newly created United States Special Operations Command, giving a four-star proponent for PSYOP and establishing a new support structure for Unified and Specified Command psychological operations across the spectrum of conflict. Heightened preparedness for wartime, contingency situations, low-intensity conflict, and peacetime operations resulted from the changes initiated from the Master Plan. By 1989, the response to the Master Plan had so changed the PSYOP environment that a new plan, was needed to accommodate the progress made since 1985. Because of the nature of PSYOP, these peacetime programs provide the most realistic training for PSYOP personnel. The overall effect of this PSYOP renaissance has not yet been calculated,

but many successes in peacetime and low-intensity conflict have already been ascribed to it.

In conclusion, the United States has practiced psychological operations in the twentieth century when such measures were a military or diplomatic necessity, but there has been great reluctance to organize and maintain units with PSYOP capability during peacetime. When the "rules of the game" changed after World War II, awareness of the value of PSYOP gradually increased, and a number of organizations were given distinct functions such as covert activities and distribution of cultural information. But no overall, permanent coordination structure has appeared to maximize the PSYOP potential of each organization as needed, either on the tactical-military or the strategic-international level.

On the tactical level, United States military PSYOP staffing has been low, and military personnel are not widely trained in the goals and methods of psychological operations. Writers commenting on this situation have pointed out that the potential requirement of United States PSYOP aid to counterinsurgency in the Third World seems to be increasing, without appropriate improvement in readiness. Although efforts were made periodically toward a comprehensive U.S. tactical PSYOP doctrine, the policy has been to approach each case individually after it arises, with no overall philosophical context.⁴² The most recent of those efforts, the DoD Master Plan, has focused greater attention and resources on the subject.

5. CONCLUSIONS

The time-honored principles of PSYOP retain exactly the same basic value as they have always had: as a force multiplier that complements military operations by lessening the determination of the target to resist. But since the days of Genghis Khan the definition of PSYOP has come to include a much broader range of activities and methods: from organized campaigns using leaflets and speakers in conventional tactical combat, to official statements by national leaders aimed at an international audience, to the everyday interaction of non-specialized military personnel with a host population. In spite of expanded application, the basic principles still apply: the message must be credible, meaning that it must be based in truth; it must be chosen and shaped to create a positive impression on the target audience; and it must be integrated into the overall military or political program of which it is part.

Contemporary PSYOP is practiced by many countries and agencies, in many circumstances, for a variety of goals. For the Soviet Union, it is a standard part of foreign policy, an accepted method of achieving national goals. For the U.S. it retains a negative connotation, both in political and military usage, although its utility has been proven in many situations. Consistency and coordination have been missing even in U.S. wartime PSYOP. For other nations involved in low-intensity or unconventional warfare as sponsors or participants, PSYOP has become an invaluable tool in gaining the support of segments of a population. For this reason, U.S. PSYOP support of allied nations, and effective

PSYOP approaches to neutral nations, has become a vital part of the U.S. program of protecting or influencing those countries.

All of this occurs in a world where: the chief potential military opponent has a dynamic, sophisticated, multilevel PSYOP apparatus; conventional military operations are increasingly costly, while PSYOP remains relatively inexpensive; and the shadow of nuclear war puts most world conflicts into vague, quasimilitary forms. Under these conditions the psychology of conflict assumes a primary role, one that must be understood by every military commander.

SECURITY RESTRICTED INFORMATION

PREFACE

The need for manuals for use in training of personnel for psychological warfare operations was discussed in several interested agencies in the spring of 1951. Several other major requirements for research needed in relation to psychological warfare were considered at the same time. A conference held at the Human Resources Research Institute of the Air University at Maxwell Air Force Base at that time was the occasion for initial consideration of ways and means of providing for these needs.

The Office of the Chief of Psychological Warfare of the Army took an active interest in the problems presented, and in the upshot it was agreed that the Operations Research Office should undertake to play the coordinating role and provide major effort for the provision of training manuals, while some other projects were undertaken by other agencies.

The preparation of training manuals is not an ordinary or normal task for an operations research agency. The Operations Research Office would not regard the preparation of such manuals on military subjects in general as part of its proper mission for the Army. At the time in question, however, it was a fact that the small staff engaged in operations research in psychological warfare in the Operations Research Office was the only such staff available to undertake such a task. It was also a fact that the lack of such training manuals as were desired reflected the lack of organization of knowledge and theory of psychological warfare, which was a hampering circumstance for operations research in the subject as well as for planning and operations in the same connection.

The preparation of a training manual presents a number of problems that permit no direct and precise scientific solution. At what level of knowledge and intelligence and interest on the part of the student should the text be aimed? How far should the text take sides in matters on which leading experts are in controversy? How far should the beginning student, whatever level is assumed, be led into the technical refinements of the

SECURITY RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATION

problem in an initial study course? How far should he be made an expert himself, or how far should it be assumed that he will be subject to varied assignments of which psychological warfare may be only one and a temporary one at that?

We will not claim pretentious certainty concerning the assumptions we have made as to the answers to these questions. We have tried to prepare what amounts to an intelligent and intelligible text for students of college caliber who do not have previous serious background in the subject and who are not embarking on professional careers or seeking graduate degrees in this particular field.

It should also be mentioned that we have no illusion that the present text can stand, or should stand, as too good to be improved. It should serve especially as a focus for critical consideration of what such a text should be, of how it can be improved, of tests as to its adequacy, and of improved versions based on further experience.

This volume is one of three that were undertaken at the start of the program two years ago. It is meant as a general introduction to the principles and practice of psychological warfare. The second volume will be concerned primarily with the media of communication—leaflets, radio, etc.—and the third will constitute a casebook of practical examples of psychological warfare techniques.

Chapter 1

INTRODUCTION TO PSYCHOLOGICAL WARFARE

Psychological warfare is one of the means nations use to promote their policies and objectives vis-à-vis the outside world. Nations have been waging it ever since there have been nations (although psychological warfare does happen to be a new name for it), but it has only recently come to be regarded as a distinct government activity that ought to be performed by specially trained professionals. Perhaps the most effective way to give an over-all view of psychological warfare is to sketch it briefly in action in ancient and modern times, relate it to communication theory, then define it and its terminology, classify it by missions and apparent source, and, finally, relate it to policy and command.

PSYCHOLOGICAL WARFARE IN OTHER TIMES

History and literature are full of examples of the use of psychological warfare (or, more briefly, psywar), many of them dating back to a time long before the term itself came into use.

One of the earliest literary accounts of the use of psywar is found in Homer's Iliad. Troy, a stoutly defended walled city, had been besieged for years by a sea-borne invasion army from Greece. The two enemies had reached a stalemate. Many of the heroes on both sides had fallen. When the impasse seemed unbreakable, the Greeks hit upon a stratagem. They built a huge wooden horse and placed it before the gates of Troy. Then they boarded their ships and sailed away—ostensibly for Greece. The Trojans supposed that the Greeks had given up the siege and had left the horse as a gift of peace. With wild rejoicing they opened the gates of the city—as the Greeks had guessed they would—and brought the horse inside to be the center of a victory celebration. When the party was over and the Trojans were sleeping it off, the Greek troops who were hiding in the horse came out—for the horse had been

ORO-T-214

3

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

made hollow, and big enough to hold a group of men. They came out of hiding and opened the gates of the city to the Greek army, which had sailed stealthily back by night. The Greeks won a complete victory. "Trojan horse" is still used today to indicate a deception, and "beware the Greeks bearing gifts" has been a common adage for 2500 years. Today, as in the days of Hector and Achilles, military commanders still use the psywar of display or planned deception.

Probably as old as the story of the Trojan horse is the Biblical account of Gideon's use of psywar in his successful defense of Jerusalem against the vastly superior forces of the invading Midianites. Gideon was aware that his army would be overwhelmed if he were to commit it to open battle with the enemy. He therefore picked 300 men and equipped each with a trumpet and torch, an earthen pitcher being placed over each of the torches to conceal its light until the appropriate moment. Under cover of darkness Gideon placed his small force in a circle around the enemy. At midnight, when the Midianite guard was being changed, Gideon ordered the pitchers smashed to expose the lighted torches. At the same time, each of the 300 sounded his trumpet. Aroused from their sleep and believing themselves under attack, the Midianites fell into panic and fought with each other in the darkness. The survivors fled in confusion, and were hunted down at will by the Jews. This use of deliberately induced panic is perhaps the earliest in recorded history.

In China the Emperor Wang Mang, when he was trying to put down some rebels, collected all the animals from the imperial menagerie and took them along in the hope that they would intimidate the enemy. The rebels attacked first, however, and in the excitement of battle the animals got loose and panicked Wang's own troops. Wang thus became the victim of one of the Communist techniques of psywar, namely, that of "depressing and unnerving the enemy commander." Says Paul Linebarger: "It undermined his health; he drank to excess, ate nothing but oysters, and let everything happen by chance. Unable to stretch out, he slept sitting on a bench." The incident also serves as a reminder of how psywar sometimes boomerangs.

Temujin, the Genghis Khan, is commonly believed to have achieved his conquests with limitless hordes of wild Tatar horsemen, who overran the world by sheer weight of numbers. It now seems certain, however, that the sparsely settled countryside of inner Asia could not possibly have produced such hordes. The empire of the Khan was conquered by bold military inventiveness

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

plus the application of psywar in many forms. The Mongols used rumor, display, and other psywar techniques to increase their reputation for numbers and ferocity and thus frighten their enemies. Even today, historians still fail to appreciate the lightness of the forces, the resourcefulness of command, and the military psywar genius with which the Mongols hit Asia and Europe seven centuries ago. It remains to add that, like the Nazis, the Mongols never learned to adapt psywar to peaceful ends. They neither made friends of the conquered populations nor converted them nor replaced them. They merely ruled for a few years, and then went back where they came from. The successes and failures of Mongol psywar point up the importance of clearly understanding that, even if psywar is used efficiently and well before and during the shooting, one must still know how to use it as an implement for peace.

Much of the psywar of the American Revolution is familiar to all of us, although we have not usually thought of it as such. Davidson has called attention to the extensive use made of psywar by the colonists in organizing and accomplishing the Revolution. They used songs, plays, newspapers, sermons, pamphlets, and periodicals. Even the Declaration of Independence was used, and with remarkable effectiveness, for psywar. Thomas Paine, the greatest pamphleteer of the American cause, merits careful study as a master of the written word for psywar purposes.

PSYCHOLOGICAL WARFARE IN MODERN TIMES

In the twentieth century the process of psywar remains essentially what it was when Gideon defeated the Midianites, but like many other human enterprises it has become infinitely more complex. The development of mass communication—broadcasting, world-wide wire news services, mobile printing presses, motion pictures—provides instruments of psywar previously undreamed of, as may be seen from the scale on which they were used in World War II as compared with previous wars.

No one who lived through or read about the collapse of France in 1940 will ever forget the Nazi development of psywar as a major weapon of attack. The Nazis' use of radio, the press, group meetings abroad, agents, display, "fifth column" terrorism, and, once violence had actually begun, screaming dive bombers—the memory of these is terrifyingly familiar to all of us. The Nazis gave the first full-dress demonstration of what psywar can accom-

ORO-T-214

5

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

plish with the new tools of mass communication and the new weapons of military warfare. And once the meaning of what they had done came to be understood, all the major combatants who had not already done so were compelled to institutionalize psywar in their own arrangements for war.

The term "psychological warfare" came into use in the United States in the early days of World War II, largely to denote certain government-sponsored operations undertaken before Pearl Harbor. It was thought that these operations might meet with greater popular and Congressional approval under that name than if they had been given the name that was at that time most common, that is, propaganda. The first American peacetime psywar agency was set up in 1941 by a Presidential order establishing the Office of the Coordinator of Information. The text of the authorizing order makes, curiously, no mention of the dissemination of information. Ostensibly, for political purposes, the COI had been organized to collect information. However, it was understood (though never written down) between the President and William J. Donovan, who became Coordinator, that a foreign information service would be established within the COI to beam short-wave broadcasts to foreign countries. As a note on public and official sensitivity to the term "propaganda," it is a matter of record that the first official public document using this term did not appear until March of 1943. This was an executive order defining the respective missions of the Office of War Information and the Office of Strategic Services. Since that time the greater inclusiveness and appropriateness of the term "psychological warfare" has been clearly recognized, and it is the term commonly used today.

A listing of some of the activities, full or part time, of American psywar personnel during and since World War II will illustrate how widely inclusive the term has become. American psywar has been involved not only in radio broadcasts, news releases, and printed publications but also in such activities as the delivery of surrender leaflets by artillery shell and bomb, the delivery of messages by loudspeaker to enemy troops, the V for Victory campaign, the sonic deception cover plan for the Normandy invasion, the making of documentary films and their exhibition on mobile projection units to liberated peoples, the exchange of students and professors with foreign countries, the erection of dummy guns and vehicles to confuse enemy air reconnaissance, and the appointment of a lieutenant general to command an invasion force made up of decoy stockpiles and false radio signals. This last activity is such an interesting example of psywar deception that the story deserves

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

telling again. When Lt Gen Lesley J. McNair was brought to England in 1944, it was planned to make the Germans think he had been appointed to command an invasion base. They were allowed to hear radio messages to and from this supposed base, and to observe what looked like Allied efforts to conceal its stockpiles from aerial observation. Actually, the base was completely imaginary, merely a part of the cover plan for OVERLORD (that is, the invasion of Europe). Yet the Germans were so completely deceived by the maneuver that several divisions were withheld from countering the Normandy invasion in order to meet McNair's imaginary army when it should strike. Needless to say, this tour de force of psywar contributed greatly to Allied success in holding the beachheads.

The tactics of hostile psywar may be illustrated from any conflict situation. For example, consider a fight between two schoolboys. They threaten, swagger, and grimace, each in the hope of scaring the other out and thus winning the victory without fighting for it. You will notice that even this elementary "psywar" is closely related to direct action; it requires the threat of action before it is effective. If neither boy backs off, the boys may go from the stage of psywar to the stage of direct action. Fists fly. Even in the midst of a fist fight, however, psywar is part of the conflict. The deft motions of head and shoulders, shifting glances, side steps, jabs, and feints are communicating deliberately misleading messages to the opponent, with a view to putting him at a disadvantage. Less subtle forms of psywar are the taunting words tossed back and forth. Action is used, some of the time, as a psywar symbol rather than for its direct result. One boy eases up, backs up, protects himself. He is trying to communicate a message that he is tired and frightened. The encouraged opponent presses his apparent advantage, rushes in, relaxes his caution. When he leaves a big enough opening, the little psychological warrior suddenly steps forward and swings a punch to his opponent's unprotected nose.

There may be yet other psychological operations going on as the two boys pummel each other in the school playground. One boy may be trying to communicate messages to other boys on the lot that will persuade them to accept him as a leader. The other may be trying to impress a girl who has shown signs of liking the curly-headed lad in the front seat.

From a schoolyard scrap to the Nazi "strategy of terror" or the Communist propaganda of world revolution is a long step. Yet the principles are the same. Substitute, for the boys, nations;

ORO-T-214

7

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

for the girl, a neutral nation whose help and friendship are coveted; for the conflict situation in the schoolyard, a conflict of aims, wants, or needs in which the fulfillment of the national policy objectives of two nations are in conflict. In such a situation between nations, as in Newtonian physics, it is impossible for two bodies to occupy the same space at the same time, and so, in one degree or another, there is war. The term "cold war" has come into our language as a recognition that war sometimes exists between two nations before "the reciprocal application of violence"—the classical definition of war—takes place. As von Clausewitz said, war is merely "politics continued by other means." Only when it has matured into reciprocal violence is it recognized by a formal declaration of war. And when the shooting war is over, action must still be taken and messages communicated for the purpose of consolidating the victory.

Thus psywar may be used in time of peace or time of war. It may be directed at one's enemies or one's friends. It is likely to be used whenever a nation's leaders believe that the communication of express or implied messages will help promote its policies or attain its international objectives.

PSYCHOLOGICAL WARFARE AS COMMUNICATION

Ten years of intensive experience with psywar and the history of several thousand years of military campaigns in which, as we have seen, symbolic (that is, message) warfare invariably played a part, give us a body of practical knowledge on the methods, use, and administration of psywar. Our knowledge of the theory of psywar, however (that is, our knowledge of the body of principles by which we can predict how a given target in a given situation will respond to a given act of psywar) is derived from the human sciences.

Psywar is not a science in the sense, for example, that physics or psychology may be called sciences. It is an application of science with a strong admixture of art. The reason for speaking of it as partly art will be understood if you recollect that a large part of psywar must be written or spoken or designed or displayed. The reason for speaking of it as an application of science you will grasp at once from what it has in common with another area of military study, namely, ballistics. Ballistics is the specialized study of those physical laws that relate to the firing of weapons. It uses the basic physical formulas of mass, gravitation, distance,

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

and velocity to determine the most effective construction and use of guns and projectiles. Ballistics is therefore an application of science, that is, the application of the disciplined knowledge of physics, mathematics, and chemistry to a special area of problems. And just as ballistics depends on the physical sciences, psywar depends on what we may call the "human sciences."

The basic process in psywar is communication. Its basic theory is therefore communication theory. In the last hundred years the human sciences, notably psychology, sociology, anthropology, and political science, as they have developed and perfected their own central disciplines have had to give increasing attention to the problem of communication. Education, journalism, advertising, public opinion measurement, human relations, labor relations, military morale studies, and community studies have all served as laboratories for developing a body of theory about communications. Study by study, experiment by experiment, research has analyzed what happens when people communicate with one another, formulated hypotheses about the process involved, and achieved greater and greater skill in predicting its effects and laying down rules as to how to achieve this effect rather than that one.

Increasingly complex experiments with animals and human beings have, over many decades, helped to clarify the relations of stimulus to response that lie at the heart of all communication. A special case of this is the long series of studies of human learning, out of which have come the "laws" of frequency, reward, readiness, belongingness, intensity, primacy and recency, and reinforcement; the systematized knowledge of learning and forgetting curves, and of motivations to learn; and the several systematic theories of learning that seek to combine experimental knowledge into a structure of principles. There have likewise been many studies of the symbols of communications, the "meaning of meaning," and the problems involved in communicating symbols from one culture to another or from one person to others. In connection with the growth of the so-called "mass media," there have been innumerable studies of communication behavior—which communications the recipients choose to receive out of those communications available to them, and their reasons for choosing them. There has been a long series of studies of collective behavior: the nature of publics, masses, and crowds; the processes of group consensus; the ways in which new forms of group behavior, new goals, new leaders come into being; and, especially, the kind of group behavior that is associated with social unrest, fear, in-

SECURITY **RESTRICTED** INFORMATION

security, and hostility. Parallel to this have been studies of inter-group conflicts, and especially of the position and behavior of minority groups in society. Attempts have been made, especially in military and industrial situations, to analyze the nature of morale and the reasons for "high" and "low" morale. In the course of long study of cultural change, researchers have given attention to the question of how attitudes and opinions are formed, how public opinion arises and how it is changed, and to such manifestations of public opinion as voting behavior. The way rumor operates in a society is another of the numerous communication processes that have been studied at length. Increasing attention has been given to differences between cultures, particularly the different ways things are done, the different values and symbols, and the different group relations that are characteristic of different nations and peoples. Finally, communication channels, attitude formation, group relations, collective behavior, leadership roles, and the other manifestations of communication to and within a society have been examined in their relation to the functioning of political systems.

This, then, is the body of knowledge from which we derive, as well as it can be derived in the present incomplete state of research, a theory of psywar, and it is this accumulating research that we draw on in Part II of this volume. The practice of psywar is the application of this theory in the light of all available knowledge about policy and objectives, situations, capabilities, and targets.

A word of caution is in order at this point. Although research is accumulating very fast in the human sciences, our knowledge of many problems and processes in psywar is very slender. A student or practitioner of psywar must therefore be always on the lookout for new findings and always wary of trusting too confidently in old practice. There will doubtless be many important research developments in this field in the next few years.

Having reviewed the background of psywar at some length, we are better prepared to define it.

DEFINITIONS OF PSYCHOLOGICAL WARFARE

Psychological warfare is sometimes so defined as to imply that it always involves the deliberate use of "symbolic communication." The difficulty with any such definition, indeed with most definitions of psywar, is that it leaves out too many things that

RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATION

are demonstrably the business of psychological warriors—unless we use the term "symbolic communication" so broadly as to deprive it of its normal meaning. When UN airplanes roared over Korea in the months after the Communist invasion of 25 June 1950, for example, they must have been recognized, and were intended to be recognized, as tokens of the power and determination of the free world to resist Communist aggression. To the extent that they were intended to be so recognized they were, clearly, intended to communicate a message to occupied South Korea and to the momentarily triumphant invasion troops, and were flying what were, in part at least, psywar missions.

When one of those planes dropped a bomb on a Communist gun emplacement it was not, of course, waging psywar against that gun position; it was engaged in direct military action. The Communist soldier who was shot through the head in the course of the attack was not the victim of psywar, he was the victim of direct military action. But this does not invalidate our point, which is that psywar must be so defined as to recognize that almost any military action may have a psywar aspect. A bomb on a gun emplacement may help persuade another gun crew to run or surrender. Machine-gun bullets on a Communist convoy may help persuade anti-Communists in occupied territory to resist. If these things happen incidentally, without being intended by the attackers, they probably should not be called psywar. But if they are intended to be understood as conveying such and such a message, they are psywar.

The key words in any realistic definition of psywar would, on the above showing, have to be communication and message. Psywar is the communication of messages, whether expressly or (as in the instances just noted) by implication. A leaflet and a radio broadcast communicate an explicit message; a show of naval force off the coast of a small country which has been remiss about its obligations under international law is an implied message. In each case the idea is to accomplish something by means of a message that would otherwise have to be accomplished by the use of force or not at all. And in each case the something to be accomplished is behavior on the part of the recipient that, in the communicator's view, will forward his nation's policies or render more probable the achievement of his nation's objectives.

There is another pitfall into which we can easily slip when we attempt to define psywar. We might argue like this: as its very name indicates, psychological warfare is a form of warfare; nations use it against their enemies, for the purpose of weakening

RESTRICTED

SECURITY **RESTRICTED** INFORMATION

their will to fight and resist; to speak of its use on a friendly country, or to speak of its use in peacetime, is to abuse language. From a strictly dictionary point of view this may be a sound point. Practically, given certain widely accepted usages of the term "psychological warfare," it leads to all manner of nonsense. The Voice of America (VOA), for example, is a peacetime agency; its broadcasts are aimed by no means exclusively at potential enemies (besides which a potential enemy is not an enemy); it often seeks not to destroy but to build up the will to fight and resist; it thinks of itself as conducting a psywar operation, and students of psywar habitually think of it as America's major bet in the psywar field. Yet a definition based on the line of argument summarized at the beginning of this paragraph would require us to take no notice of VOA's operations in this volume.

The reader will already have guessed the general shape of the definition to which we have been leading up: psychological warfare is the whole range of functions performed by psychological warriors, whether inside or outside duly constituted psywar agencies. (The pilot of a plane flying a psywar mission is engaged in psywar and is, for the moment at least, a psychological warrior.) It is, admittedly, a "circular" definition, but it has the advantage of excluding nothing that the psychological warrior ought to think of as part of the over-all enterprise in which he is engaged. And it will allow us to give due weight to certain facts that cannot, for the reasons just mentioned, be overlooked in a working definition of psywar without creating difficulties. We can, for example, bear in mind that the normal end product of any psywar operation is explicit verbal messages, whether written or spoken, and yet give due weight to the fact that sometimes the messages are implied, as illustrated in the next paragraph. We can bear in mind that psywar is often "waged" in peacetime, "against" friends, "for" constructive purposes, and yet give due weight to the fact that one very important type of psywar is waged in wartime against enemies, mostly by soldiers, not civilians, and for purposes that are destructive or even lethal. The one thing we must be careful to do in using so broad a definition of psywar is to be clear with ourselves—and with our readers—as to the type of psywar we are speaking about at each point in our discussion.

We have said that psywar is one of the means nations use to promote their policies and objectives vis-a-vis the outside world. The other means, which we have already noticed in connection with bombing raids, are by no means always easily separable from it. They include such things as war, military aid, blockade,

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

financial aid, diplomacy, and withholding diplomatic recognition. In all these—and we have deliberately moved back and forth between hostile and friendly means—we have forms of action that may or may not have an intended message content, and insofar as they do have a message content may have a greater or lesser one. We may give economic aid to France because we wish it to be economically strong or because we think the giving of it will communicate to Frenchmen a message: "The United States is rich and generous, and for you not to be its allies would be foolish and ungrateful." The US diplomat abroad may decline an invitation to a cocktail party at the Swiss Embassy because he does not wish to encounter the Belgian charge until he has had further word from Washington, or because he wishes to signal a nonverbal message to the Swiss Embassy: "We dislike certain things you are doing and propose to avoid you until you refrain from them." A good example of an implied message is "Operation Magic Carpet":

AIRLIFT FOR ALLAH*

The Koran orders all the faithful, except slaves, women without companions and those who cannot afford the journey, to make the *hajj*, the holy pilgrimage to Mecca, at least once in their lifetime. Last fortnight, as the season of the *hajj* drew near once again, more *hajjis* (pilgrims) than ever before—*hajjis* from Turkey, Iran, Iraq and most of the desert cities and oases of North Africa—followed the Koran's injunction and swarmed into the Lebanese city of Beirut, the usual way station on the road to Mecca. Each clutched in the voluminous folds of his *ihram* (the pilgrim's sheetlike uniform), an airline ticket to Jidda, the airport nearest the holy city.

There were good reasons for the unusually large turnout. For one thing, the ordained day of the pilgrimage's start this year fell on a Friday, and a pilgrim who makes the *hajj* on Friday (the Moslem sabbath) is seven times blessed and sure to achieve heaven. For another, Saudi Arabia's King Ibn Saud, whose oil-rich country includes Mecca, had lifted the usual tax of \$52 per pilgrim. Agents of the three local airlines began selling tickets to Jidda like hot cakes. But when the holders turned up in Beirut, they found that there were not nearly enough planes to carry them. The *hajjis* began piling up in Beirut's streets, in the mosques and at the airport.

They didn't complain. They didn't protest. They just waited. Forbidden by Islamic law to wear hats on *hajj*, they sat huddled hour after hour under the broiling sun, certain that Allah, in his wisdom, would somehow get them to Mecca. Lebanese peddlers did a land-office business selling umbrellas against the fierce heat. "Allah, *hajji* [Out of the way, pilgrim]!" cried airport attendants. The huddled groups moved aside, returned and continued to wait—for once on *hajj*, no pilgrim ever turns back.

* Mohammedan legend puts the number of pilgrims to Mecca each year at a constant 700,000 but since the count of mortal visitors is usually far short of that number, the difference is believed by the faithful to be made up by a suitable number of angels.

* Reprinted by permission of the publisher.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Miracle in Washington. On Thursday, with the holy days just a week away, desperate airline officials appealed for help to Harold Minor, able US Minister to Lebanon. Minor promptly dashed off a "night action" (most urgent) cable to Washington, pointing out that here was a real chance for the United States to make friends in the Arab world. Something of a miracle then happened: the State Department got the point. At Rhein-Main airport in Wiesbaden, Germany, at Wheelus Field in Tripoli, at Orly Field in Paris, US airmen were suddenly alerted for special duty. Three days later, the first of 13 huge US C-54s landed at Beirut's airport. Next morning Operation *Hajj* was under way.

Each clutching a box lunch (bread, olives, cheese, fruit) provided in haste by the American Friends of the Middle East (organized by US Communist Dorothy Thompson), the *Hajjis* were hustled aboard the big planes, 50 to a flight. All day long the transports shuttled back and forth to Jidda. One old man, deaf and blind at 85, was led aboard a plane by his son. "This is help sent by Allah," the son told the US pilot. "We are linked together today by love and faith." Another passenger on the magic carpet provided by the United States was irascible old Mullah Kashani, Iran's bitterly anti-American religious leader. He rewarded dog-tired Pilots Captain Alfred Beasley of Atlanta and Lieut. Angelo Elmo of Washington with wet kisses on both cheeks.

Five days later the last of 3763 stranded pilgrims was loaded aboard the last flight. The airlift had traveled a total of 121,600 miles. Some of the US airmen had spent 27 out of 40 hours in the air, but the trips had been more than worth it. The pilgrims' airlift had done more good than any other act of the United States' otherwise fumbling and unimaginative action and inaction in the Middle East. It was the one success US diplomacy could claim in a week of continued crises. The Iranian oil dispute with Britain had dragged on for more than a year, while Iran slid to the edge of bankruptcy, chaos and Communism, hanging on the cliff like Pauline in her perils; last week the United States and Britain tried to settle the mess and were flatly turned down by Iran's Mossadegh.

It would take a lot before Arabs would forgive the United States for its help to Israel, but Operation Magic Carpet might well be the beginning. "Speaking for myself and 40 million Arab Moslems," Lebanon's Mufti Alaya told Minister Minor, "I would like to say that this is the turning point of American relations with the Moslem world. This aid has been not to governments, but to people. It is neither military nor economic but spiritual."

Then he issued an unprecedented order: this year, the *Hajjis* were to include the American people—infidels though they are—in their prayers.

We may, in short, think of the means nations use in furthering their objectives as a continuum stretching from direct action without any message content whatever to sheer message without any direct-action content whatever. In practical terms one end of the continuum is a punch in the nose; the other is a series of words which seek to accomplish a desired aim without fighting for it. At one end of the continuum is the Communist attack on Korea; at the other is Communist propaganda about "slave labor" in the United States. At the extremes, therefore, the two kinds of action are readily distinguishable one from another; in the middle they are barely distinguishable; and nowhere on the continuum is one kind of means entirely isolated from the other. Communicated

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

by news and rumor, the Communist attack on Korea served as powerful psywar on other populations in Asia. The slave-labor line was related to potential revolution in non-Communist countries.

TERMINOLOGY OF PSYCHOLOGICAL WARFARE

Some of the vocabulary of psywar consists of words used in a sense with which you may not be familiar. It may be helpful to be sure you understand such terms as "source," "target," "message," "medium," and "symbol" before going on to Part II of this volume.

The source of psywar is simply the person or organization that originates the message. Thus the source of the material on the VOA is the Government of the United States. The purported source of the material on Nachtsender 1212, a radio station the Allies operated for psywar purposes during World War II, keeping up the pretense that it was a clandestine station within Germany, was a group of Germans, while its real source was an Allied psywar operator.

The target of psywar is the individual or group to whom the psywar message is directed. The target of surrender leaflets may be an opposing enemy unit. The target of Nachtsender 1212 when it broadcasted recipes for cooking waste materials was the German housewife, who, it was hoped, would become furious at the thought of Germans having to serve up and eat such swill. The target may be smaller than the total audience which receives the psywar material. And the effective target may be smaller still, because some who receive it may turn a deaf ear to it.

The message of psywar is always a symbol or a series of symbols that is to be communicated to the target audience with the intention of inducing (a) a specific and desired reaction that will lead to (b) specific and desired behavior on the part of that audience. The message may be as simple as the V sign of World War II or as complex as Wilson's Fourteen Points, which were powerful psywar in World War I.

By a "symbol" (and we know from the preceding paragraph that most psywar is symbolic communication) we mean something that substitutes in the communication process for an object, a process, or an idea. Obviously a dog cannot be communicated. But the idea of a dog can be symbolized by the word "dog" and communicated readily. Similarly, a Bronx cheer is a symbol of an attitude that can be readily and effectively communicated. A picture of a lake in the woods may serve as a symbol to communicate the

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

nature of a summer vacation, and in this case literally a picture would be "worth a thousand words." You will notice an important characteristic of symbols, namely, that they always represent the original object, idea, or experience at a high level of abstraction, or, to put it another way, at a level of reduced cues. All the sensory cues one would get from the object "dog" (shape, movement, color, sound, smell, touch, etc.) are replaced by the single visual stimulus that one gets from seeing the three letters d-o-g. This is the quality that makes symbols easy to misinterpret; that is, a symbol can mean to a given individual only what his experience has taught him to connect with it, and no two persons, certainly no two distinct cultural groups, have ever had exactly the same experience. More of that later.

By media, we mean the communicative devices for carrying a message from source to target. Among others, they include broadcasts, news, leaflets, the "slower" printed media (magazines, books, etc.), posters, meetings, motion pictures, loudspeaker operations, rumor, agitation, display, and events planned or staged with a view to their psywar effects.

These terms are all common to communication study. Other terms, such as "black" and "white" operations, and "political," "tactical," "strategic," and "consolidation" psywar, are peculiar to psywar and will be treated at somewhat greater length in the following sections.

CLASSIFICATION OF PSYCHOLOGICAL WARFARE

By Mission

The process of psywar, of course, is a single process. There is no sharp distinction between the basic principles that should govern the conduct of psywar against enemy troops as contrasted with psywar against enemy civilians, or as between the principles governing the conduct of peacetime psywar as contrasted with wartime psywar. Nevertheless it is useful, for some purposes, to distinguish between four kinds of psywar (the fourth, consolidation, is sometimes lumped together with the third, political):

Tactical psywar is directed at specific enemy units in a specific battle situation in the combat zone and is, or should be, integrated into the tactical planning for that situation. Its distinguishing characteristic, then, is its specificity. For whereas strategic and political operations admit a considerable amount

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

of generality both as to target and response, tactical psywar is just as specific as a bayonet charge or an artillery barrage. Its usual mission is to induce enemy soldiers to surrender, whether individually or collectively (that is, in units). It can also be used, however, to lower the morale or the will of the enemy troops to resist, or to mislead the local enemy command in such a way that he will take some tactical step that, particularly if we are expecting it, we can exploit to our advantage. Tactical psywar, like strategic psywar but unlike political, is almost always unfriendly. The exception would be dropping leaflets on the troops of America's allies, a regiment of ROKs, for example, that has been surrounded by the enemy and needs encouragement.

Strategic psywar is ordinarily directed behind the lines, either to civilian or to military groups. It is integrated into the over-all military plan for the war as a whole, or at least for some important phase of it, a theater for example, with a view to payoff in the indefinite rather than the immediate future and on a broad rather than a merely local scale. A typical tactical psywar operation might be leaflets directed at a unit of enemy troops, urging immediate surrender. A typical strategic psywar operation might be a series of broadcasts or leaflets dropped on the residents of an industrial section within the enemy's country, in an attempt to cut enemy war production by spreading disaffection among, for example, industrial workers.

But no sharp line can be drawn between the two. The leaflets dropped in the enemy's industrial zone might have the further purpose of immediately affecting supplies to a sector of the front where we are about to attack, which would make them partly tactical.

The term "political psywar" is best reserved for operations that are not integrated into any military plan, although they may, like many broadcasts in recent years from General Headquarters, Far Eastern Command, be conducted by the military. Their purpose, as already indicated, is at least as often friendly (to the immediate target, anyway) as unfriendly; and they are less likely than tactical or strategic psywar to call for any specific action by the target audience. Often they merely attempt to build up desired attitudes on the part of the population of the target country, or this or that political, social, or economic group. Sometimes they attempt to set group against group within the target; equally well, however, they may attempt to bring about a rapprochement between inimical groups, by calling attention, for example, to some alleged common interest that they have hitherto ignored. Much of the "cold

ORO-T-214

17

SECURITY **RESTRICTED** INFORMATION

war" is political psywar. If it is related to the future military plans of the antagonists, it is not related to them so directly as tactical and strategic psywar. Typical examples of political psywar are the broadcasts of the United States and the Soviet Union to the Near East, the Stockholm "Peace Petition," the Berlin blockade, the American Information Centers throughout the still-free countries, the program of exchange of persons between the United States and Europe, and our recently suspended Russian-language America.

Consolidation psywar (which is often, and quite legitimately, considered a part of political psywar) is needed when the shooting is over but the victory is not yet consolidated. One of the hard lessons the twentieth century has to teach is that military victory does not end a war. Often, it would seem, greater skill is required to "win the peace" than to win the war. In Japan since 1945 it has been necessary for the United States to use its psywar know-how to the full in an attempt to give new direction to the Japanese people's goals and activities. Any future US military victory will impose a similar—perhaps even greater—necessity upon our occupation authorities, probably, though not necessarily, with constructive purposes like those which have governed recent US occupations, and the occupation plans will undoubtedly call for carefully integrated psywar operations. There, indeed, lies the best reason for distinguishing between political and consolidation psywar. The latter, like tactical and strategic psywar, is part of a military plan.

By Apparent Source

Psywar operations, whether tactical, strategic, political, or consolidation, may be white, gray, or black, depending on the apparent or ostensible source of the messages communicated.

White psywar is "overt." Its source is not concealed in any way; usually, indeed, this type of psywar emphasizes its source, so that its effectiveness depends in large part on the authority and prestige of that source. The news broadcasts of the BBC during World War II are an excellent example of white operations. At the outbreak of hostilities the BBC had a long-standing reputation for objective and truthful newscasts. During the war it made every effort to capitalize on this reputation by maintaining the same program formats, call letters, and identifications, and took pains to call attention to itself as the originator of the news, commentary, and entertainment it carried.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Surrender passes are another classical example of white operations. In the European theater in World War II, surrender passes were printed with a handsome bank-note type of border; the great seals of Allied nations were handsomely displayed; the signatures of the commanding generals were shown—all to make the passes look like official documents, backed up by the Allied governments, and cause the enemy's troops to feel that they were certain to be honored by Allied soldiers.

Loudspeaker operations against enemy units are an example of white tactical psywar.

The use made of President Roosevelt's speeches—particularly the "Four Freedoms" speech—in World War II was white psywar in its purest form. These speeches were communicated to the enemy audience by every available medium, from radio broadcasts to leaflets to phonograph records, as pronouncements by the President of the United States, in an attempt to capitalize on his popularity and prestige.

Black psywar operations are "covert" operations. The intention in such operations is to pass off the material communicated as messages from some source other than the true one. Since its true source is not revealed, black psywar can do things that white psywar could not possibly do without injuring the sender's cause. For example, here is a leaflet that was distributed among American troops on the Western Front (with the typical errors):

Military authorities demanded a nationwide war on VICE. They got a sham battle—a polite blood testing campaign which would not alarm ladies-aid societies and parent-teachers association.

Nevertheless, police raided a large number of cabarets, dance halls, and joints in 21 small, medium, and large cities. These raids showed that of the 20,000 women investigated, a staggering proportion had venereal diseases.

Over 50% had V. D. 21% were prostitutes. Of the 79% nonprofessionals, 61% were pickups, 18% were girl friends. 17% were girls under 20 years.

54% were wives of men serving in the armed forces ABROAD.

Both groups were mostly members of the growing band of "V" girls, who declare that they feel a patriotic compulsion to console troops.

IS YOUR GIRL AMONG THEM?

YOU CAN'T TALK V.D. OUT OF EXISTENCE—IT IS THERE!

The real source of this leaflet was a German propaganda unit, but the pretended source was the US Army. The leaflet had nothing to do with stopping VD among troops; its real purpose was to lower morale among American troops.

A classical example of black psywar on the air was "Operation Annie." The following brief account of its activities is by H. H. Burger:³

SECURITY **RESTRICTED** INFORMATION

Somewhere in Luxembourg, in a secluded house which once belonged to the Gestapo, the American Twelfth Army Group had installed a small group of men: writers, experts, speakers and radio technicians. They formed the staff of the Nachtsender 1212 (Night Radio Station 1212). Their task was to win the enemy's confidence, to gain the reputation of being a reliable and necessary source, by giving absolutely correct information about the military situation at the front.

In the course of events "Annie" became quite a girl. Slowly but surely her personality developed. She was thoroughly feminine. In innocent tones she would speak about the fact that the Reich's cartographical institute was short of maps numbered 315 to 318, which were badly needed for national defense. And suddenly you would, if you were German, find yourself asking why the institute was asking for maps of Westphalia, still more than 300 miles inside the Reich.

Then again she would turn into a good housewife and advise you on the use of the oddest waste material for cooking and eating and you would wind up by asking yourself furiously, if you were a German, why you should be forced to do such a will.

A set of party directories and phone books, captured near Trier, provided the writers with the material for a very successful stunt:

Late one evening a small town was captured near Gladbach-Rheydt, an important party stronghold. At that time the capture was known to Annie only. At 2:30 a.m., 1212 came in with a flash: A call for help by the party headquarters of the town already in our hands. All listeners in Gladbach-Rheydt were requested to call party headquarters or all known party functionaries—phone numbers and addresses were given—and urge them immediately to dispatch five trucks, manned by reliable party men, to rescue their comrades and important party documents. They were to proceed along a prescribed route. Only Annie knew that this route was already controlled by American troops. That night the Gladbach-Rheydt local of the Nazi party lost five precious trucks and five good drivers.

The features had a widely varying character. Sometimes they were eyewitness reports, breathless stories by getaway men. Sometimes they were general observations on the course of the war, never pro-Party, but always pro-German. They were pieces full of worry, skepticism, full of ifs and buts, very much the sort of pieces a German military critic would write about the failures, the blunders, and the drab consequences. But 1212 never sneered, was never sarcastic. It was always desperately and sadly honest about every lost position, every lost division, and ultimately the lost war.*

The term "gray" is used to refer to covert operations in which the recipient is not told the source; the sender conceals his own identity, but does not "hang" what he is sending on anybody else in particular. In this area fall the propaganda of rumor, news credited to "usually reliable sources," "high military circles," "it is said that," etc. The Germans, during the Nazi occupation of France, for example, ran several magazines and newspapers in Paris. They did not describe themselves as German controlled and often took the French side of an argument, but they proved to be convenient channels through which to communicate the German propaganda line when necessary. Again, for example, unsigned leaflets, which theoretically might have been prepared either by

*Reprinted by permission of author and publisher.

SECURITY **RESTRICTED** INFORMATION

the enemy or by dissident elements within the ranks of the receiving audience, are gray propaganda. Thus we see that the distinction between gray and black is not so sharp as that between black and white. Gray is perhaps best regarded as one form of black psywar.

If a theme or an idea that white is trying to get across can be echoed or reinforced or corroborated by genuinely deceptive black or gray, the target audience is more likely to give it credit. Thus a judicious combination of white and black is sometimes very effective. However, for reasons we shall see below, use of this procedure calls for great caution on the part of the sender.

RELATION OF PSYCHOLOGICAL WARFARE TO POLICY AND COMMAND

This brief survey of what psywar is would be incomplete without a further word concerning the relation of psywar to national policy of all kinds—military, political, economic, etc. Psywar is always a means to some end set by policy, and we shall think more clearly about it if we conceive of the ends always being set not by psychological warriors but by another group of people altogether, namely, the policy makers. Skillful psywar, on that showing, is psywar that takes the policies laid down by the policy makers and does the best possible job of implementing them by messages to the target audiences. This point is worth emphasizing because endless confusion results whenever it is ignored, as it is when, for example, people blame the unpopularity of the Nazis in the German-occupied portions of Russia in World War II on "bad" psywar, when they mean merely that the Nazis and their policies displeased the Russians. The policies that it is psywar's task to implement may be good or bad, wise or unwise, calculated to please the target or displease it, consistent or conflicting, stable or shifting. Psywar's job is to take them and do the best it can with them. (The fact that psywar personnel often do make policy, especially in the absence of directives from higher authorities, is beside the point. The fact that a surgeon often drives his own car does not abolish the distinction between surgery and chauffering.)

One reason that confusion of the kind noted above (for example, blaming Nazi psywar for decisions made by Nazi policy makers), makes the relation between psywar and policy one of the most complicated and tricky parts of psywar theory is this: Psywar personnel are, or should be, the personnel best qualified to say in advance what the psywar consequences of a proposal will be,

SECURITY **RESTRICTED** INFORMATION

or what the psywar consequences of a current policy actually are. Giving expert advice on these points is, in that sense, a psywar function, whether the policy makers ask for it or not, or, having asked for it, use it or do not use it. Policy, in other words, has a psywar aspect, just as it has an economic and/or fiscal aspect (about which the policy makers are wise to consult their economic advisers). A nation is, moreover, in a bad way if the predictable psywar consequences of a policy are not taken into account before it is adopted. It is also in a bad way if psywar personnel are not in position to inform the policy makers as to what policies would predictably produce the most favorable psywar consequences. But the real policy decisions, the decision, for example, as to whether to adopt a policy despite its probable psychological impact on psywar's target audiences, are under our system a political function that belongs to elected officials and their immediate appointees.

When a nation sets about activating policy, obviously the first requirement is intelligence regarding the target. A planner must know what are the "given conditions" that he must modify in the direction of policy goals. Psywar, like military action and all the other instruments of policy, must therefore work in the closest possible cooperation with intelligence. When policy has specified the desired goals and intelligence has appraised the existing situation, then a nation's psywar group is ready to go into action. Its psywar group must, of course, function in close coordination with the other striking arms of policy—the military, the foreign service, etc. Bold words alone, without the Nazi forces behind them, would never have made a "strategy of terror." Clearly no psywar, no matter how skillful, from the Western Allies could be counted on completely to predetermine the actions of the Soviet Politburo, although psywar coordinated with NATO, economic measures, and diplomatic policy unity may accomplish something toward that end. No psywar without supporting military power could by itself have secured the surrender of Japanese troops on Pacific islands. It is in the area of the crucial margin that psywar is likely to be effective. If psywar could not by itself beat the Nazis, it could still deceive three German divisions and thus make the beachhead invasion easier. If psywar by itself could not defeat the Trojans, it could at least get the Greek army into position to do so. In this marginal area, psywar can often tip the scales between failure and accomplishment, opposition and cooperation, reconstruction and chaos.

The distinction between policy and psywar emerges as all the more important when we ask, "How does one evaluate a psywar operation?" Like all other instruments of policy, it must be eval-

SECURITY **RESTRICTED** INFORMATION

uated in terms of its effectiveness in furthering a predetermined policy. A military campaign, an economic boycott, or a treaty is "good" if it advances policy, "bad" if it does not. No matter how brilliant the strategy, how airtight the boycott, how skillful the negotiations, still the instruments fail if they do not move events toward the desired goals. So it is with psywar. No matter how attractive the leaflet, how scintillating the radio program, how large the parade, how widespread the rumor, it is good psywar only if it shows maximum possible results in modifying the behavior of its target in the direction of policy goals. There is no other test, and if we confuse policy and psywar we are left with no test at all.

SUMMARY

Psywar has been used with considerable effect since at least the beginning of recorded history. Perhaps modern psywar operations were developed during World War I. However, the pace and scope have increased greatly since those days. From more or less optional use by amateurs, some talented, others less so, the world has progressed to a state in which self-preservation alone demands the most intense psywar pressure that a large body of trained professionals commanding immense resources can bring to bear. Unfortunately for the efficient performance of this task, important knowledge of the theory of psywar is almost entirely lacking. Applications of existing knowledge have been fairly well recorded, but relatively little effort has been made to find answers to numerous fundamental questions, and consequently the questions go unanswered or are answered provisionally by guesses.

You should remember that psywar is basically communication. Consequently, communication theory is all we have on which to build psywar theory. It follows then that psywar may be defined as communication of a message, which may be explicit or implied, in order to bring about some action. Considered more broadly, psywar may be defined as the whole range of functions performed by psychological warriors. You should remember that psywar may also be friendly rather than hostile, despite the contradiction in terms.

Besides communication of the message, psywar operators are concerned with the source, target, medium, and symbols.

Psywar may be classified first by mission and then subclassified by apparent source. According to its mission, psywar is

SECURITY **RESTRICTED** INFORMATION

said to be tactical, strategic, political, or consolidation. Any of these may be further subdivided into white, black, or gray psywar.

Finally, you should understand clearly and never forget that psywar operators do not make policy. The mission of psywar is to carry out the policies formulated by the policy makers.

Chapter 2

THE MESSAGE

Consider the framework in which psywar operates. A policy has been stated. Intelligence has been gathered and a target has been determined upon. A directive has been issued, specifying the target, the general thematic content of the message, and the desired result. The psywar officer sits down to construct his message. But he knows that before he can succeed in arousing the kind of behavior he wants as a result of that message, he must accomplish three things:

In the first place, he must get a hearing. In psychological terms the message must succeed in getting attention. This is not easy, because there is great competition for attention. At any given time we have available to us far more than we can look at, far more than we can listen to, far more than our senses can possibly transmit, and we must make a choice. In the case of psywar the choice is often prejudiced because people distrust "propaganda," or because the target government puts a penalty on paying attention to enemy messages, or because it is hard to deliver a strong signal to a distant target. But unless this step is taken, unless the message attracts attention, then none of the other steps are possible.

In the second place, he has to get his meaning across. In psychological language, this is the problem of perception. This is not an easy step, either, because words and pictures do not mean exactly the same thing to all persons. Furthermore, people tend to read into a message what they want to read, or what they have been accustomed to, so that what the target individual gets from the message may be very different from what the psywar operator tried to put into it.

In the third place, he must get the response he wants. He must depend on his message to arouse, in the individual who receives it, energy to push that individual in the desired direction. The desired result may be action (for example, surrender) or attitude change that underlies and affects action (for example, lowered

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

morale, which makes a soldier fight less effectively). Surrender and lowered morale, of course, are only two among many possible aims of psywar and an enemy army is only one of many possible targets. But if the goal is change, the psywar operator must reckon with barriers obstructing the kind of behavior he wants to arouse. Supposing that his purpose is to accomplish surrender, he may find that group morale is very high in his target (as was found in the German Wehrmacht) or that surrender is not within the honor code of the target army (as was found in the case of the Japanese before the formula was changed from "surrender" to "cease resistance"), or that close surveillance by political officers (as in the Communist armies) makes surrender very difficult. A target can respond only through channels that are available to it and in relation to the barriers that it faces.

This is the process by which every successful act of psywar works: message; attention in relation to competing stimuli; perception in relation to the target's frame of reference, needs, and motives; and response in relation to existing attitudes, barriers, and channels. Now let us look harder at this process.

Messages are to psywar what troops and firepower are to military warfare. But when troops are committed they may be recalled, or their orders may be changed and their tactics altered. When a message is sent, there is no recalling it, no changing it. Every person who has ever written a propaganda leaflet or given a propaganda broadcast has felt the peculiar helplessness that comes when the writing or speaking is done and the message is irretrievably sent. It is out of the sender's power, operating on its own. Will it get a hearing? Will it mean to the receiver what it is intended to mean? Will it accomplish what it is designed to accomplish? Many a psywar operator has worked a little longer, expended a little more loving care on his message, because he realizes these questions can't be rethought once the message is on its own.

In terms of the psywar process, what is a message?

At the source, it is a symbol or a collection of symbols. It may, as we have seen above, be verbal or nonverbal, though most of our discussions in this book will deal with verbal messages. It may be a collection of words for print, or it may be a collection of words for broadcast. It may be the V for Victory sign, the scream of German dive bombers, nostalgic music sent to soldiers far from home, or a picture of a sexy girl distributed to troops in the front lines. It may be a controlled event. Gromyko stalking out of a UN Security Council meeting is a symbol with real meaning in the Russian plan of psywar. Communist army maneuvers

SECURITY **RESTRICTED** INFORMATION

near the border of non-Communist countries serve as symbols of Soviet power and threat. When Theodore Roosevelt sent the American fleet around the world he was communicating a psywar symbol. As a matter of fact, nearly every weapons system has its symbolic importance quite apart from its direct and coercive effect. For example, the Communists have never let the people of Asia forget that we used the A-bomb only on Asiatics, and future uses of atomic weapons will certainly have implications beyond the amount of destruction they accomplish and the amount of retaliation they will bring upon us.

All messages, whether events, words, pictures, or sounds, have certain typical characteristics, and it may be well to review those characteristics as they are seen at the source. For one thing, a message is not directly coercive, as is, for example, a bayonet charge, an economic blockade, or a break in diplomatic relations. A message must accomplish its purpose by communicating symbols to the minds of men, not by mutilating their bodies, starving their stomachs, or restricting their movements.

Because a message operates by symbols it has great advantages and great disadvantages as compared with coercive methods. It has the advantage of being swift and portable and relatively inexpensive. A message, that is, can be sent immensely farther and faster than an armored division, at relatively little risk to life or limb, and at relatively little cost in materiel or manpower. On the other hand the effect of an armored division in action is direct and immediate and may be evaluated much more easily than the effect of a broadcast or a poster. Furthermore, because a message works by symbols rather than by direct coercion and because it must be so highly portable, it must operate as a kind of shorthand. It must use signs to represent ideas and material things. And the difficulty is, as is brought out in a later section of this book, these signs do not always mean the same to all people. There is an all-too-high probability of their being misread.

At the source, then, a message is a symbol or collection of symbols made and controlled by the sender. Whether the symbols take the form of an event, electrical impulses released in the air, or ink printed on paper, they are shaped at the source and sent out in the direction of the target.

At the target, a message presents itself as a stimulus-event. It is merely one of the countless stimulations that present themselves to the senses of the members of the target audience and compete for their attention. Whatever the message accomplishes it must accomplish through the process of stimulation and response within the human organism.

ORO-T-214

33

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

A central problem of modern psychology has been to try to bridge the gap between stimulus and response. To do this, of course, it is necessary to understand both the so-called "situational factors" that affect the response, and the qualities or characteristics of the responding organisms that cause different individual organisms to respond to identical stimulation in different ways. We know that the process is not simple. It is not easy to separate and measure the effects of complex environment on individual behavior. It is not easy to separate out the qualities of personality that enter into a given action. Yet the basic nature of the problem is apparent. Consider, for example, the different ways in which a regular Army sergeant and a US senator will react in the presence of a full colonel. Consider the different ways in which a victorious army and a trapped squad will react to surrender propaganda. Those are relatively easy differences to explain, as compared to those that must be considered when we are devising a message that, for example, is to bring about disloyalty or subversion in persons who live in the heart of a distant country.

Yet this is the kind of thing psywar has to do. If the problem of psychology is to say with accuracy and consistency what it is about people that accounts for the differences in their reactions to common situations, then the problem of psywar is to apply that knowledge. That is, psywar must be able to predict with reasonable accuracy and consistency what kind of stimulation (what message) applied to what kind of people in what kind of situation will cause them to react in a specified way. In the following pages, therefore, an effort has been made to gather together what psychology and the other social sciences have to contribute to an understanding of that problem.

SUMMARY

A message is, at the source, a symbol or a group of symbols, verbal or nonverbal, made and controlled by the sender. It can get its response only by first communicating symbols to the minds of men; that is, it must first get a hearing. At the target a message is a stimulus-event, among many competing for attention, that can bring about an action only by causing stimulation and response within the human organism.

In brief, a psywar message, to be effective, must get a hearing, be understood, and bring about the desired response.

Chapter 3

RECEPTION OF THE MESSAGE

ATTRACTING ATTENTION TO THE MESSAGE

By attracting attention we mean getting the recipient to do so much as look at or listen to the message. How long he looks at it or listens to it and what he thinks of it are matters that are considered in later chapters. Unless we can get his attention to begin with—and this is not easy to do from outside, which is the position from which psywar operations are conducted—the question of how long and how fruitfully we keep it does not arise.

Human beings can only sample the sensory world. So much is available to us that we can select only a tiny fraction. How much we miss we begin to realize only when we acquire a new interest that opens a different corner of experience. When we learn to fly an airplane, for example, we find ourselves noticing things about the wind, the clouds, and the sound of an engine that we had never paid any attention to before, although the stimuli had always been there if we had only selected them.

The importance of a stimulus, whatever its form, depends on how the stimulus relates (a) to other conditions or events in the external world and (b) to conditions within the person whose sense organs are being stimulated. Because of these two sets of conditions, it may happen that a small amount of stimulation may sometimes attract more attention than a very large amount. For example, a football player will listen far harder for a number spoken softly by his quarterback and react far more violently to that small stimulus than he will to the much louder sound of a truck passing a shady spot where he is drinking lemonade. When we are flying across the country, we are likely to pay careful attention to a line of distant clouds in the west that we might never notice if we were going about our business on the ground. Thus the problem of getting a person to pay attention to a stimulus is by no means solved by

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

merely delivering a large amount of stimulus to him and letting it go at that.

Because of the conditions under which a psywar operator has to work, what has just been said is especially applicable to the attention-getting problem. His target, as the operator must constantly remind himself, receives a great excess of stimulation, from which it will select only a small amount. In the psywar business, competing for attention has grown more difficult as the mass media have grown larger. The growth of motion pictures, the development of high-speed printing along with the increase of literacy, the development and spread of radio, and now the advent of television have all come along within the last fifty years to fight for man's eyes and ears. The average American is said to spend about twice as much time on the mass media as he did thirty years ago; and to have perhaps fifty times as much material to choose from. The average Arab, the average Chinese may not spend so much time on them, but the competition for even their attention is much stiffer than it was.

So the psywar officer has to work within a glutted market, has to fight against the target's own restrictions on and defenses against propaganda, and has to offer his message to a rather complex selection system that depends both on conditions within the recipients and conditions about them as the message is received. What principles will be of use to the psywar officer as he tries to get his message attended to?

Availability of Message

It is obvious that the stimulus must be delivered to the target before attention can be expected. It should also be clear that, other things being equal, the more readily and easily available the message is the more likely it is to attract attention.

When studying language habits of human beings a few years ago, Zipf¹ developed the "principle of least effort," which he later applied to many manifestations of human behavior. This principle, in brief, is that human beings will try to minimize the over-all average rate of their work expenditure per unit of time and consequently to expend the least effort possible in view of their needs and expectations. You can test this on your own mass-communication habits. Are you not more likely to listen to a station which comes in with a clear signal than one which makes you strain to hear? Are you not more often inclined to read a story in a magazine at home than to walk ten blocks to the library?

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

But, you will say, there are times when you do insist on listening to a faint station, or do walk a long way to the library. This also is an important fact for psywar operators. When the Communists occupied Seoul, anti-Communists who still had radios would crawl under the floors of their houses and wrap the radio and themselves in stifling bed quilts so that they could listen a few minutes a day to the UN radio. They would stealthily pick up UN leaflets, although they could pretty well count on being killed if caught picking them up. The lesson to learn here is that availability and need are relative; that is, everything else being equal, the residents of Seoul would have taken the easier way, selected the mass communication that was easily available, and taken as little risk as possible. But everything else was not equal. Zipf would say that these people were considering their future problems at the same time as their present problems and trying to minimize their effort over the long haul. By doing the more difficult thing now, they expected to be able to save effort and trouble later. Another way to say it is that these persons felt within them an urgent need to receive UN messages.

The psywar operator can usually count on at least two groups of people—his special friends and his special enemies inside the target country—to maintain a high level of attention to his messages. They need to hear what he has to say, to make use of it pro or con, the one group because it is ammunition for them, the other because they need to counter it. In Seoul, for example, both the clandestine anti-Communists and the Communist monitors could be counted on to try to listen to our radio output. From the great mass of people inside the target country, however, psywar can expect no such interested attention. For them, therefore, availability of the message is the important thing—the strength of the signal, the convenience of the hour, the place where the leaflet is dropped, the location of the picture.

Even with the interested audience of friends, of course, a readily available message is more likely to get through than one that is not readily available. For example, many of the anti-Communists in Seoul felt they could dare to listen only ten minutes a day at most. This left it up to American psywar operators to enable them to hear, and hear the needed message, without wasting precious time. If they had to spend five minutes tuning in, or five minutes waiting for the program they needed, half a day's communication time would be wasted. If there were many days when the station could not be heard, or the program was not the one needed, the effort and risk would soon cease to seem

SECURITY **RESTRICTED** INFORMATION

worth while. Hence availability is a first requirement, both with friends and enemies.

Differentiation of Message from Background

A person cannot respond to all aspects of a stimulus situation alike; if he did, his behavior would be wholly disorganized. Each of us tends, rather, to organize his attention in what psychologists call the "figure-ground relation." One part of a stimulus pattern tends to stand out clearly—this is the figure; the rest is perceived as background. We tend to respond to the figure rather than the background, although the background may influence the way in which we respond.

Thus, psywar operators need to have as clear a grasp as possible of the answer to the question: what are the qualities of a stimulus-event (for example, a message) that are likely to differentiate a figure clearly from its background?

Here are a few principles that emerge from research on the figure-ground relation:

The larger of two areas tends to be seen as the ground, the smaller as the figure. Designers of successful book jackets and advertisements make use of this knowledge by placing a relatively small amount of type on a relatively large background. In psywar terms, this means that chances of getting attention are being squandered—other things being equal—when a leaflet is nearly all text and graphic, or when a poster does not make use of ample white space to contrast with its message.

A complete and closed design is more readily seen as figure. A person will use his imagination, once his attention is fixed on an uncompleted figure, to complete it—as the well-known Rorschach "ink blot" tests show. But our concern here is with how to get attention to begin with, that is, how to get people to perceive as figure the particular thing we want to communicate. The verdict of experimental psychology on this point is that an uncompleted design is less likely than a complete or nearly complete design to stand out as figure. For psywar this means, other things being equal, that representational pictures are more likely to gain attention than abstract ones; simple closed layouts in a poster are more likely to be seen as figure than less simple, more cluttered ones; clear type is more likely to be seen as figure than dull or broken type. Remember once again that the discussion here is about attention, not about meaning and not about making people think. There may be good reason to use abstract art on an in-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

complete design for other purposes. All we are saying for the moment is that they may not be so heavily counted on to get attention.

The brighter of two areas tends to be perceived as the figure. This is usually true even when the darker area is smaller than the brighter, especially when the brighter area is toward the center of the visual field. One notable exception to this principle, of great importance to the psywar operator, is the case of black type on white paper, which does get attention, as we all know, whether theoretically it is supposed to or not. Usually, however, attention goes to the brighter area, so that a leaflet's or poster's chances of getting attention can often be much improved by putting a spot of bright color into the display. The details embedded in the darker areas will not attract much initial attention; to begin with, therefore, we attract attention to the bright area, hoping to arouse enough interest to send the reader on to examine the darker areas next.

Some colors are more effective than others in making one part of an area stand out as figure. Color will ordinarily attract attention away from black and white, as many experiments with advertising have shown, and some colors will attract attention from other colors. For example, an orange picture or sketch will be more readily seen as figure against gray or white than a red picture or sketch, and a red unit surrounded by gray or white is more likely to be seen as figure than a blue one. In other words, the psywar operator can get attention by contrasting carefully selected colors.

What colors have the highest attention-getting value? In one experiment Adams² exposed four colors at a time for very brief periods, and the observer was required to report which color he noted first. The results indicate that orange was seen most frequently (21 percent of the time), with red, blue, black, green, yellow, violet, and gray following in that order. However, in this experiment the brightness (absolute amount of reflected light energy) of the color samples was not fully controlled, and this somewhat reduced the reliability of the results.

What combinations of colors attract attention best? Another group sought to determine the maximum distance at which words printed in different-colored inks and on different-colored papers could be read. (Distance thus became an index of discriminability rather than initial attention-getting value. The subjects were instructed to look at the papers.) The results indicate that of 11 combinations the most effective were (in order) blue on white,

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

black on yellow, green on white, and black on white. The least effective were orange on white and red on green.

Two other observations may be noted briefly: To the observer, red hues seem to be closer than others, and darker colors seem uniformly heavier than lighter ones.

Let us add a note of caution regarding the data on color attractiveness. Such differences between colors may not be common to all persons; that is, we might get different results from observers from different cultures. This remains to be seen, especially since there are some indications of consistency from culture to culture, for example from Japanese to American, which suggest that the same color-preference scale is common to all cultures. Other indications suggest that the language and concepts used in some cultures in responding to color stimuli may make it difficult for their members to discriminate colors at all, or at least may alter the color-preference scale. For the time being it would seem wise to examine any available cultural data concerning the specific target we are aiming at before committing a psywar operation to any particular colors or combinations of colors as means of getting attention.

Most of the research on the figure-ground relation has been done in the field of vision not that of sound. Yet some of the tried and tested devices of the orator for gaining emphasis are in the nature of separating figure from ground. For example, the good speaker knows when to use an increase in loudness and a rising inflection to call attention to an important phrase. He can set off with a brief pause the word or phrase to which he wishes to attract special attention. He knows how to change his rate of speech and to say the important point slowly and impressively.

The psywar planner, of course, can delegate responsibility for figure-ground problems to his producers and announcers. He can in large part delegate another set of auditory figure-ground problems to his sound engineers. The latter problems have to do with how to get speech to be heard clearly as "figure" against a background of noise. Research indicates that there must be a considerable ratio of speech energy to noise energy before speech becomes readily intelligible. Exactly how great this ratio must be is an engineering problem. But one concern of the psywar planner certainly must be to see that enough energy is gotten into the loudspeaker or the radio signal to overcome noises and jamming. Background conditions will vary the demands on the signal. For example, Miller³ in 1947 found that speech is more readily intelligible against high-pitched sounds (900 to 4000 cycles

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

per second) than against low-pitched ones (20 to 1100). This means that a loudspeaker will probably require considerably more power to be heard above artillery than above equally loud small-arms fire. There is also good reason to think that a language such as English, where the consonants are very important, will require loudspeakers that are strong in the high frequencies. This is because consonants are usually higher frequency sounds than vowels. In a language where less of the meaning is carried by consonants there would be less need for loudspeakers to be strong in the highs.

Whether in visual or auditory psywar, contrast is obviously the subject under discussion. The problem that is being posed is, how can we attract initial attention to a psywar message by causing it to contrast with the rest of the target's environment? And it is worth noticing that we really have to do with two levels of contrast: that between figure and ground within the message itself, and that between the message as figure and the target's environment as ground. In general a sharper figure-ground relation within the message will serve to attract attention to the message as against competing messages; an advertisement that makes good use of white space or of color contrast will, other things being equal, attract more attention than one that is less varied. And the principles of figure-ground relation within the message will, in general, apply to the relation of message to environment as well.

The psywar planner therefore needs, and must try to get from intelligence, as nearly complete a picture as possible of the background against which his message must attract attention. He will then try to design his message so as to contrast with that background. There might, for example, be an advantage in using a psywar radio announcer with a slightly "foreign" accent; in the ears of members of the target audience this would be in contrast with the other sounds competing for their attention (although the value of attention would have to be balanced against the resistance the unfamiliar accent might arouse). A spot of bright color can be counted on to attract initial attention to a leaflet. For the same reason, music will serve as bait for radio commentaries or for loudspeaker messages, and a bright and snappy headline, perhaps one with a new twist, will serve as bait for a run-of-the-mine news story. In 1940 the Germans dropped on Paris carefully prepared leaves symbolizing the falling of French soldiers, and they were more conspicuous because they were dropped not in autumn, when falling leaves are common, but in springtime. The contrasting bait, let us notice, need not always be brighter or louder or more exciting. In some situations a calm quiet voice

SECURITY **RESTRICTED** INFORMATION

on the radio will contrast in the desired manner if the other voices being heard are excited and emotional. And it is hardly necessary to say that there are occasions when psywar must avoid any great contrast—for instance in black propaganda, which needs to be sluiced unobtrusively into the common information diet of the target.

Nevertheless the thing the psywar operator must rely on most for gaining attention for his message is sheer intensity of the stimulus. The intensity should be appropriate to the conditions in the target audience's environment. Intensity by itself contributes to the likelihood of getting attention. A loud signal on the radio, a booming voice from a speaker are examples. Both the Communists and the Nazis have made good use of this principle. The Russians in North Korea would often plaster a whole wall full of identical posters, thus creating a gigantic splash of color and mass. Huge parades and more-than-life-size statues have been used for attention-getting purposes by all totalitarian movements. (The gigantic curtains of light that served as backdrops for some of the Nazi party rallies will never be forgotten by anyone who saw them.) Yet there is not a simple 1 to 1 relation between intensity of stimulus and the effect on the target. Several other factors must now be considered.

Other Important Factors

Amount of Previous Stimulation. According to Weber's law, in order to produce an increase in the amount of effective stimulation we must not merely increase the physical magnitude of the stimulus but must increase it by an amount proportionate to the amount of the initial stimulus. Increasing a weight from 90 to 93 grams may make it noticeably heavier for the man holding it; it does not follow from this that increasing it from 93 to 96 or from 115 to 118 will also make it noticeably heavier. What matters is the ratio between the added stimulus and what it is added to, not the absolute amount of the added stimulus. With weights, experiments show that the increase must be not less than a thirtieth part of the weight being held in order to be noticed.

Weber's law has important implications for psywar even though no psywar operator is likely to be concerned very often with the weights his target audience can lift. For the principle involved can be restated so as to apply to other senses as well as the kinesthetic. It tells us that there are definite limits to the use of intensity to gain contrast. For, if each competitor for attention merely tries to talk louder or more excitedly than the others,

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

before long all competitors will merely be screaming. If the competition for size and brightness is intense, soon differences in size will become imperceptible and all shades of brightness will look merely garish. The more psywar intensity is competitively increased, the farther it will have to be jumped every time in order for the jump to be noticed. And, this being the case, a smart planner learns to rely on other devices for attracting attention.

It is self-evident that psywar can be most economically waged where—or when—the mass of competing stimulation is relatively small—in psywar during the lulls between battles, for example, or in political psywar against civilians who are chronically inactive.

Repetition. One way of manipulating intensity is to accumulate it, that is, by repetition. Seldom does the psywar operator expect one or two messages to accomplish his total purpose or even catch the attention of large segments of his designated target. He knows it can't be done, no matter how strongly his messages may be delivered. He must therefore repeat his message, preferably with enough variation to avoid monotony. In short a message that would be barely noticeable in the mass of other activities if communicated only once may, if repeated many times, eventually command a high degree of attention.

The nature of the relation between repetition and attention as it applies to sensation and behavior has not yet been studied much even under laboratory conditions. There are, however, good reasons for believing that such a relation exists. Frequent and consistent, though minor, interferences with whatever a person is doing tend to build up a state of tension, and this eventually requires him to do something about it. The first thing he does usually is to pay attention to the stimulus situation that is interfering.

In order for the effects of repeating an individually ineffective stimulus to accumulate into something that does catch the attention of target-audience members, the repetitions must be closely spaced. A daily dose of a small leaflet, an idea planted regularly in a newspaper, or a suggestion artfully reiterated over the radio may scarcely be noticed in the first days or weeks. But it may well build up to something that is regularly attended to and thus become a jumping-off point for further ideas.

The effectiveness of repeating a given intensity of stimulation may be greater if there are unconscious sets, or states of readiness, that dispose the recipients to react in line with the stimulation. There is ample evidence that a repeated stimulation does

ORO-T-214

43

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

build up a set to react to it and that this is true even if the person being stimulated is wholly unaware of it. For example, an experiment by Rees and Israel⁴ made use of five-letter anagrams, that is, disarranged letters that can be rearranged into a word. A special (experimental) group was put through practice sessions where they were asked to solve 20 anagrams that could be solved only by using a word associated with nature (for example, rokbo, which can be turned around only into brook). The group members were not told of this limitation, nor did they notice it in the course of the experiment. After the initial series of 20, they were given a further 20, all of which had several possible solutions (for example, dacre, which could be rearranged to spell cedar, raced, or cared). A second, or control group, was then given this second series of anagrams, without having had prior experience with the anagrams involving nature solutions only. By comparing the two groups, it was clearly shown that practice with the nature-solution anagrams had established in the subjects of the first group a set to solve the second ambiguous series predominantly in terms of nature-related words. Other experiments by the same workers showed that sets could be established for other kinds of solutions as well, and that the occurrence of the nature set in the experiment just cited was not a chance affair. The interesting point here is that these sets had all been built up without the knowledge of the people concerned. They had merely solved the problems, without realizing that all the solutions had something in common. But as far as the point of the experiment is concerned, the enforced repetition of the nature set in the preliminary series had paid off.

The psywar uses of this device are numerous and valuable. The hint that the war was not going very well for Germany, that all was not well, and that important facts were being bottled up by the German leaders were repeated over and over again on "Annie's" radio station during World War II. The message was so sluiced into Annie's output that it would hardly be noticed the first time a listener heard it. Its purpose, which it undoubtedly achieved with many listeners, was to build up a set, and as a result of it more and more suspicion that the good news was not so good as it sounded and the bad news worse than official news releases pictured them to be. Similarly, when a Japanese ship had been sunk but the sinking not yet admitted by the Japanese admiralty, we could quietly ask—and keep on quietly asking—"Where is the (naming the ship)?" The Japanese would either have to do something about the accumulating stimulus or accept the consequences as regards the set of the radio listeners.

SECURITY **RESTRICTED** INFORMATION

Timing and Spacing. The psywar operator can manipulate his intensity factors advantageously also by varying the parts of his message within time and space. The skillful advertiser knows how to build a campaign to a crescendo, varying the emphasis frequently from point to point to avoid monotony and retain attention, and so building to a point where all the appeals and arguments come together. The skillful designer knows how to lead our eyes around a display, attracting attention first, then directing it. Research with eye cameras⁵ indicates that the spot where we usually look first on a page, an ad, or a poster is slightly above the middle and slightly to the left. From there, as we scan the display, our eyes typically move upward and to the left and then in a clockwise direction around the whole thing. This is not always the case, of course. Sometimes a clever attention-getting device will make us start elsewhere on the page or scan in a different pattern. But if you look at any collection of tested advertisements or posters you will notice how many of them have the attention-getting picture or headline above the middle and to the left. The good psywar designer uses the same device in his printed display materials: he so arranges his materials on a leaflet or poster as to take advantage of the clockwise motion of the eye and thus control to some extent the order in which his reader attends to the materials included. At least that is what he does for audiences that read from left to right, for we do not know whether the same principles apply to audiences who read from right to left (like the Arab peoples) or from top to bottom (like the Chinese). Let us repeat our word of warning: most of the research we can report here has been done in America and on Americans. It should be applied to other and different peoples only after making use of all available information on their communication habits. In approaching a new target audience the psywar planner, in other words, should not take it for granted that they are like us. His best bet, if he is not certain, is to ask these basic questions: How do experts in the target country use communications to further their ends? How do they design printed materials? How do they time combinations of messages on the radio? Of course the experts in the target country might be wrong or at least less right than they would be if their social science research were as far advanced as ours, but their guess is likely to be better than ours.

One service which the psywar operator can perform by way of directing attention is that of indexing his message. All mass communication indexes its content, although not always by a

SECURITY **RESTRICTED** INFORMATION

table of contents. A newspaper, for example, indexes by means of headlines and provides a judgment of relative importance by varying their size. Radio indexes by cue words within programs and sometimes relies on "Flash!" or "Bulletin!" to rouse attention quickly. An index of this kind gives a key not only to content but also to relative importance. And the indexing, of course, is within the power of the operator to control.

Relation of Stimulus to Needs. Another way to manipulate the intensity of communicated messages is to relate them to what the person who is to receive them needs. A person who does not have a need related to the stimulus he is receiving is not likely to notice that stimulus unless it is extremely strong; a person who does have a need related to the stimulus is likely to notice the stimulus even though it is of low intensity. We shall want to talk about this later in its relation to perception and response. But it will be sufficient to point out here that advertisers have used this knowledge for years in their struggle for attention. They always try to make the headline or the illustration ring a bell by tapping one of the basic needs of the audience. That is why you often see pictures of nearly nude women attracting attention to advertisements for such not-too-closely-related things as motor oil. The needs of a person, of course, change from time to time. A sex-starved man after a full meal is more likely to notice the picture of a female form than an illustration of a beefsteak; in fact it would take a very prominent picture of a steak to attract him at all under those conditions. In any case a psywar message can immensely increase its likelihood of getting attention by relating itself to the known needs of the target. If the members of the target audience are nostalgic or bored, they can be attracted by familiar music or pictures or news from home. If they are being kept in the dark as to war developments and curious for news, they can be attracted by a battle map.

If you have any doubt that the intensity of stimulation is increased by relating a message to a person's current needs, test yourself. How do you react even to a very small reference in a newspaper to a speech you have made, to a casual reference to a fire in progress near your home, or to the name of your home town in a list of names otherwise unattended to during a newscast?

Relation of Stimulus to Target's Personal Experience. The intensity of a stimulus may be varied also by relating it to what a person knows. If he has had experience with that kind of stimulus material in the past, he is likely to have his pattern of response to it set up. For example, we have just mentioned the attention-getting value of information about one's home town, or of some-

SECURITY **RESTRICTED** INFORMATION

thing else that is close to a person's experience. An item about the enemy soldier's home town is likely to attract his attention, other things being equal, even if it is a very small item; a very large item about an unfamiliar place is less likely to attract it. On the other hand his experience with a given kind of subject matter may have led him to want to avoid it in the future. He may react to it in terms of boredom or disgust or suspicion. Thus some radio listeners at the present time seem to turn off their attention during certain painfully familiar commercials. Similarly, American soldiers listened to Tokyo Rose's disks but tended to resist or ignore what she said.

It is worth noting that, if a message does not fit into the target's educational and cultural background, the chances of getting attention for it are small. It might be difficult, even through the strongest message, to impress illiterate Chinese Communist troops with the idea that their radar equipment is not functioning well for some obscure reason. And it was discovered long ago that when we talk in rather general terms about democracy and freedom to most Asiatic audiences, we attract very little attention, because these concepts, as we use them, tap nothing within their experience.

Summary

What does all this mean to the psywar operator who wants to attract attention to his message? First of all he must try to make his message easily available. In the second place he must so design and construct the message as to make it contrast with the environment in which it is to be received. The principles of figure-ground relation will help him here. He will try to take full advantage of background space, completeness of design, brightness, and color differences. Most particularly, he will try to use a color that will stand out. The foregoing, of course, applies only to printed messages. In broadcast messages he will try to be sure that he is getting enough energy into the signal to overcome noise and jamming and that he is using the right frequencies and so making his words intelligible. He will try to see that his announcers make use of tested devices of speech for obtaining contrast and emphasis. Finally he will manipulate his messages so as to derive the advantages of intensity of stimulation without always having to use sheer physical intensity (which, he knows, requires larger and larger increases in order for them to be noticed at all). Instead of relying only on loudness and size,

SECURITY **RESTRICTED** INFORMATION

he will use repetition. He will vary timing and spacing for maximum cumulative impact. He will try to relate his message to some current need of his target, since this will greatly increase the effective intensity of the message; and he will be careful to keep his message within the cultural experience of his target for fear there will be no attention to it at all.

re

GETTING THE MEANING ACROSS

The World around Us and the Pictures in Our Heads

In the early twenties, Lippmann⁶ introduced his widely influential book on public opinion with a famous chapter entitled "The World around Us and the Pictures in Our Heads." This chapter tried to describe man's relation to his environment. In particular, Lippmann was interested in the way man gets the information on which political decisions are made. He cited the fact that a public figure is many different things to many men, and that two nations can attack "one another, each certain that it is acting in self-defense, or two classes [can be] at war each certain that it speaks for the public interest." Then he continued with a much-quoted statement: "They live, we are likely to say, in different worlds. More accurately, they live in the same world, but they think and feel in different ones."

s

is.

5

pens
ow

e

Lippmann came to the conclusion that every man thinks and feels in a different world from the world of every other man. Every man constructs a pseudo environment between himself and his real environment. He does not deliberately falsify his environment. But his own experience is never exactly like that of any other observer, and he interprets any new experience in terms of his previous experience. Only a small part of his experience, moreover, comes to him direct from environment. The great bulk of it filters through news services, textbooks, reports, tradition, custom, gossip, and rumor. These do not give him a full and accurate account of the things they speak to him about—not necessarily because of any deliberate choice on anybody's part not to do so but because of

...the artificial censorships, the limitations of social contact, the comparatively meager time available in each day for paying attention to public affairs, the distortion arising because events have to be compressed into very short messages, the difficulty of making a small vocabulary express

is

ts
in

SECURITY **RESTRICTED** INFORMATION

a complicated world, and finally the fear of facing those facts which would seem to threaten the established routine of men's lives.*

In an eloquent passage, Lippmann tells how man builds a picture in his head of the world beyond his reach:⁶

The world that we have to deal with politically is out of reach, out of sight, out of mind. It has to be explored, reported, and imagined. Man is no Aristotelian god contemplating all existence at one glance. He is the creature of an evolution who can just about span a sufficient portion of reality to manage his survival, and snatch what on the scale of time are but a few moments of insight and happiness. Yet this same creature has invented ways of seeing what no naked eye could see, of hearing what no ear could hear, of weighing immense masses and infinitesimal ones, of counting and separating more items than he can individually remember. He is learning to see with his mind vast portions of the world that he could never see, touch, smell, hear, or remember.*

This is the state of affairs psywar is up against. It deals with a target audience that has little direct contact with its political environment but builds up mind pictures of that environment and makes decisions on the basis of those pictures. We may assume that the pictures are not precise representations of reality. Worse still, no two members of the target audience have pictures in their heads that are exactly alike. The nature of those pictures, however, and the respects in which groups of men hold approximately the same picture, are among the most important facts the psywar operator needs to know. For what he is trying to do is to modify the pictures in certain persons' heads. He knows what picture of political reality he wants them to have. But in order to get his way about that he needs to know what picture he has to change, and which persons or groups of persons have what picture in their heads, so that he can plan the changes he seeks to bring about. Most important, assuming that he can get attention for his message at all, he needs to know what happens to a message after it has been communicated and, in general, how new messages become parts of the pictures in people's heads.

We perceive the world in terms of its meaning to us. The psychologist ("perception" is his term) means by perception the interpretive response an organism makes to a stimulus. Our perception of a stimulus is the meaning that that stimulus has for us.

Individual Perception

This, then, is the first thing to remember about perception: the individual always tends to perceive the world in terms of its meaning to him. Krech and Crutchfield⁷ give the example of an

*Reprinted by permission of author and publisher.

SECURITY **RESTRICTED** INFORMATION

aviator who lands in a primitive country where no airplane and no white man have ever been seen before, that is, where people have had no experiences with either. The complicated machine and the light-skinned man with the parachute on his back will not, however, be meaningless to those people. Far from it; they will at once relate the new experience to whatever frame of reference they have that will help explain it. Perhaps the flying machine will seem to them a kind of bird. Perhaps the strange man who can fly through the air will seem to them a god. In any case they will somehow manage to classify and interpret the new experience in terms familiar to them. And the resultant classification-interpretation will be its meaning for them.

A flight operations officer searching for an airplane lost in the heart of Africa would, of course, interpret the event in question, both plane and pilot, very differently; it would never occur to him that the latter was a god before whom he must bow. Perhaps the point will be clearer if we ask ourselves how a garage mechanic and a physician would perceive an automobile accident at which they both happened to be present. Each would be receiving essentially the same physical stimuli as the other. But their interpretive responses would be as different as chalk and cheese. The physician might see injured people, with a smashed automobile as background. The mechanic might be seeing the broken parts of the car and turning over in his mind the problem of getting the car moving again, for his natural response puts the injured people in the background. Bring an insurance adjuster, a new-car salesman, a reporter, and a priest to the scene and we will have four more responses, four more structurings, each different from all the others and each dictated by the experiences and interest of the individual involved.

Take another example. Imagine an American tourist and a native Mexican at a bullfight. What will each perceive? The American "is likely to perceive and stress the pain to the animal, the messiness of the scene, and the flies. The Mexican fan, on the other hand, might perceive and stress the skill of the performer, his daring or fearlessness, the fine technical points involved, and even the fine spirit of the bull in putting up such a good fight."

In each case, the observer is selecting a certain part of his immediate experience. The doctor selects the broken human bodies, the mechanic the broken cars. In so doing they distort the experience because they emphasize parts of it unequally. They may even add to the experience; many a witness to an accident,

SECURITY **RESTRICTED** INFORMATION

in his excitement, believes he has seen something that in point of fact has not happened at all. And they relate experience to their previous experience, their needs and goals. The doctor will relate it to his medical training, the mechanic to his mechanical training, the salesman to his occupation of selling new cars, the priest to his vocation of saving souls. This is the way perception works. It is functionally selective. It selects so as to structure*experience meaningfully for the perceiver. In selecting, it tends to distort, add, relate.

Take an example from psywar. During World War II this country made a series of highly expert films on the subject "Why We Fight." One of the films was "The Battle of Britain." Consider now how that film might be perceived by an Anglophobe who thought England had led us into war, by an internationalist who believed England had saved all Europe by holding the Nazis back until we could get ready, and by a pro-German who believed that we were on the wrong side. The Anglophobe would tend to select and emphasize the parts that showed England's lack of preparedness and the great stocks of supplies that had to be shipped in from America. The internationalist would tend to select the parts that showed the bravery and skill of the Royal Air Force and the stoical courage of the bombed British civilians. The pro-German, on the other hand, would probably see the picture in terms of the mistakes of the German campaign, and of what might have been. The Anglophobe would probably interpret the treatment of the British as unduly favorable, the internationalist as accurate and moving, and the pro-German as lying and propagandistic. The German air generals who appeared briefly on the screen would look fiendish to the internationalist, heroic and commanding to the pro-German, and pretty much like the British generals to the Anglophobe.

Organization of Experience

A second thing to remember, then, is that we structure experience in a meaningful and functional way. Each of these men, as he watched the film, would be selecting and structuring the experience so that it would have meaning to him in terms of what he already knew and believed. The English psychologist Bartlett³ said many years ago that "It is fitting to think of every human cognitive reaction—perceiving, imagining, thinking, and reasoning—as an effort after meaning." It is characteristic of

*"Structure" is a verb used by psychologists to mean "give structure to" or "organize."

SECURITY **RESTRICTED** INFORMATION

people everywhere that they want to live in an organized world, where sense data will mean something and new experiences can be related to something familiar and stable. The older people get, the stronger is this need for consistency in meaning (hence the growth of conservative political, economic, and social attitudes with age). These habits of dealing with consistencies in environment become crucially important. Thus when something new, different, strange is encountered, the easiest thing to do is to react to it in a way that will give it meaning, and let us feel we can cope with it. This dispels insecurity, makes us feel at home.

Another way to look at what was happening when different persons experienced "The Battle of Britain" or the auto accident or the bullfight is to say that each was structuring the experience functionally, that is, so that it would work for him. The Anglophobe, for example, was selecting material that would strengthen his mental set of dislike of England. Each in his own way was selecting that which would meet his needs, agree with his moods, strengthen his already existing mental sets.

There is a great deal of research evidence to back up this view of how perception works. McClelland and Atkinson⁹ observed groups of sailors from a submarine school; one had been fed only 1 hour before; the second had gone 4 hours without food; the third had gone without food for 16 hours. The men were told that the purpose of the experiment was to find out what objects they could see in very poor light. They were put in a darkened room and shown a screen on which an operator projected nothing at all, although he went through the motions of operating a projector. Five seconds after each "slide" had been "exposed" the experimenter gave the subjects a broad hint that could be interpreted in a number of ways: "Three objects on a table. What are they?" or, "All the people in this are enjoying themselves. What are they doing?" When the answers were collected and checked it was seen that the longer the subjects had been without food, the more likely they were to give food-related responses. That is, the "people" were likely to be enjoying themselves eating; the three objects on the table were likely to be hamburgers, etc. Hunger also increased the size of the imagined food objects. For example, when the hint was "An ash tray and a hamburger—which is larger?", in the hungriest group 75 percent of the subjects said the hamburger was larger, whereas in the least hungry group exactly half the subjects said the hamburger was larger, and half said it was smaller.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Bruner and Goodman¹⁰ in another well-known experiment used two groups of children, one from well-to-do families, the other from poor families. Asked to estimate the size of coins, the children from poor families overestimated the size of common coins, and the wealthier children did not. Each group, in perceiving the coins, was deeply influenced by its needs and its sense of values.

A simple experiment by Murray,¹¹ which you can try out yourself, shows the effect of mental sets on perception. Groups of young girls were asked to describe the picture of a man under two different sets of conditions: before and after they had participated in a game of "murder." The two sets of descriptions were significantly different. After the game the girls saw in the picture a much more vicious, dangerous, malicious man than they had seen before.

Many experiments have been designed to show the effects of mood on perception. In one of the more complicated of them, subjects under hypnosis were asked to describe a number of pictures. First the subjects were hypnotized, then the proper mood was induced--happy, critical, or anxious--and then the pictures were shown. After describing the pictures the subjects were told that they would forget all about what had happened, were brought out of hypnosis, and then hypnotized again. This time another mood was induced but the same pictures were shown, this procedure being repeated until they had described the pictures in each of the various moods. The results? The descriptions differed amazingly under the different mood-hypnosis conditions. Looking at the same picture the same subject might give these three descriptions under the different conditions:

(Happy mood) "Complete relaxation. Not much to do--just sit, listen, and relax. Not much at all to think about."

(Critical mood) "Someone ruining a good pair of pressed pants by lying down like that. They're unsuccessfully trying to study."

(Anxious mood) "They're listening to a football game or world series. Probably a tight game. One guy looks as if his side wasn't winning."

This is what perception does to "facts." The psywar operator must keep this in mind and make allowance for it. As Krech and Crutchfield⁷ say, "There are no impartial 'facts.' Data do not have a logic of their own that results in the same perceptions and cognitions for all people. Data are perceived and interpreted

SECURITY **RESTRICTED** INFORMATION

in terms of the individual perceiver's own needs, own emotions, own personality, own previously formed cognitive patterns."

Another way to say this is that individuals organize experience in terms of their established frames of reference. Lippmann⁶ spoke of the pictures in our heads as "stereotypes" of experience. Today we are in the habit of calling them "frames of reference." Whichever term is used, what is being said in effect is that a new perception does not live a life of its own. Instead it promptly becomes a part of the organized framework of other perceptions that we have been building up all our lives. Thus, as we have seen, primitive tribesmen see an airplane descending in their midst, and their perception of it immediately becomes a part of their organized perceptual world. They think of it as a bird. They have to interpret it in terms of what they know. That is the frame of reference within which the plan has meaning for them.

Let us take another example. A Hindu, looking at a picture of a bull, would probably classify it in terms of a religious frame of reference; a Korean farmer might perceive it in terms of the farmwork it could do; a Spaniard might put it into a sporting frame of reference; a Texan would probably see it against a framework of cattle raising.

Frames of reference have much to do with the different ways people evaluate the same psywar message. Mention of a farmer with five acres of land might bring expressions of pity from Americans, expressions of envy from most Asians. Our description of freedom of the press has repeatedly been characterized in quite different and unflattering terms by Communists, whose frame of reference involves a wholly different concept of the press. Obviously it is important for the psywar operator to learn as much as possible about the frames of reference within which his messages are likely to be perceived. However, this is often difficult to do, and many mistakes result from doing it poorly. A classical instance here is a German leaflet used in World War II. The illustration was a bedroom scene, which is theoretically good bait for frustrated soldiers. But the bedroom was depicted much more luxuriously than any bedroom the average GI had ever seen, and the leaflet lost all its force because the readers related it to fiction or the movies or the "very rich," and not to themselves.

There are four characteristics of the way our frames of reference operate that are of special importance to psywar.

One of these is that we tend to organize experience so as to group characteristics of people and events. Thus most of us have ready-made reactions for use in evaluating other racial and eth-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

nic groups. Americans tend to think of the British as stuffy, and the British to think of the Americans as crude. Americans tend to think of orientals as "inscrutable," and white Americans tend to think of Negroes as musical, carefree, irresponsible, and able to stand deprivation better than whites. These ready-made reactions save us a lot of time in evaluating people and social situations. You don't have to pause to study the new German resident down the street if you already have a picture in your head that tells you Germans are intelligent, efficient, stiff, and basically cruel and unfriendly. If you then meet your German neighbor and find that he is really kindly, friendly, and a little awkward, you simply classify him as an "exception."

The fact that these groupings are so common and so easy to establish is a fact that has been used since time immemorial for psywar. A good example is a series of cleverly contrived leaflets, available in World War II leaflet archives, in which the Nazi propagandists tried to exploit the American stereotype of Jews. The leaflets were episodes in the unpleasant career of "Sam Levy," who was back home making money hand over fist and seducing the sweethearts of soldiers. The Communists have tried to inculcate in people all over the world a stereotype of Americans as "capitalists, imperialists, aggressors," carefully devised so as to group together under the heading "Americans" all the characteristics that the Communist dictionary defines as reprehensible.

This, as the reader will recognize, is the invariable procedure in the type of propaganda known as "name calling." Understanding it will, furthermore, help us to see the role of "glittering generalities" and "transfer" in psywar. The Communists, where their propaganda has been successful, can evoke an instant and negative reaction by calling the name "Capitalist"; Americans, where theirs has been successful, can do as much by calling the name "Communist." Similarly, the word "socialism" has assumed for many Americans a stereotyped meaning that is quite different from the meaning the word evokes, for example, in England. On the other hand, Americans tend to respond very favorably whenever they hear "the American way" or "free enterprise" or "America First" or "freedom of opportunity," even if they are used with a very high degree of generality. The point is that everyone has "built in" these ready-made reactions and tends because of them to put a great many things under the same tent that do not necessarily belong together. Everybody does it, and the process is the same whether, like the victims of Communist propaganda, we are deceived as we form the stereotype, or, like the recipients of US propaganda, we are

ORO-T-214

55

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

told the truth. The point is to associate what you want to tear down with some hated symbol (the Nazis, for example, constantly in their home propaganda associated the American Government with Jews) or to associate something you want to build up with some favorable symbol (a lofty ideal, a revered tradition out of the past, etc.). This is making use of the phenomenon of grouping to transfer the evaluation of the known symbol to the unknown.

But the next characteristic of frames of reference, even more important for psywar, is that we tend to organize experience so as to resist any change in strong structures. Suppose that a Russian has learned through many years of Communist teaching to perceive Americans as greedy and money-mad aggressors who want to colonize the whole world. Suppose he then listens, on the short-wave radio from far away, to an American who assures him that we really seek only peace and friendship, and have no territorial ambitions. Will he promptly change his stereotype of Americans, or will he organize his perceptions of the broadcast so as to leave his previous perceptual organization intact? Almost certainly the latter. He will interpret the broadcast as "propaganda" or "lies." For once we build up a strong organization of meanings we tend to resist any change in it. We are likely to reject or distort any meanings that would be at variance with some previous perceptual structure that means a lot to us.

There is a great deal of research on this topic. For example, one significant experiment came out of an effort sponsored by the American Jewish Committee to combat anti-Semitism by means of cartoon propaganda (Cooper and Jahoda ¹²). To check on the effectiveness of the effort, cartoons were submitted to a number of people, including known anti-Semites, all of whom were asked for an interpretation of the cartoons. Some of the cartoons featured a "Mr. Biggott" as the anti-Semitic villain, and others depicted anti-Jewish actions in various situations. These were intended to remind anti-Semites of their own practices, on the theory that prejudiced attitudes, thus exposed to light, could be identified and held in abeyance. The interpretations obtained from prejudiced persons, however, showed a result quite different from that intended. Take, for instance, what happened with a cartoon showing the hospitalized Mr. Biggott demanding "only sixth-generation American blood" for his transfusion. This was seen by some prejudiced subjects as a sketch of a socially inferior person striving for social status, and by others as one of a foreigner or of a Jew. In other words the cartoon failed to achieve

SECURITY **RESTRICTED** INFORMATION

its central purpose, that is, to get each of them to identify himself with the stickler for sixth-generation American blood. A cartoon showing an anti-Semitic congressman being favorably impressed by and wanting to hire for his new party an applicant with a record of window smashing, race rioting, and jail terms, likewise mis-carried with the anti-Semites, some of whom said, "It might be anything crooked... might be a new labor party. That shady character makes me think so," or "It's a Jewish party that would help Jews get more power." And so on.

A direct onslaught on anti-Jewish attitudes would doubtless have been even less successful; most prejudiced people in our society don't like to admit their prejudices; those who do admit them defend them openly. Hence the cartoons have to be subtle to have any effect whatever. We have seen that the effect was frequently not that intended. Indeed the cartoons, once distorted, seem to have served as further support for the prejudice they were supposed to expose and destroy.

The psywar moral that the above experiment should drive home is this: psywar usually wastes its time and energy when it goes directly against strong structures, and that is what psywar is doing when, for example, it tells the enemy that his motives are bad or that he has made a mistake in getting into the war or that the American ideology is a good one and his a bad one for all mankind, etc. Messages that run so directly counter to motivational trends within the target audience haven't a ghost of a chance of being taken seriously and in the manner intended. And friendly psywar can make the same mistake; a major difficulty we have been up against in building NATO is that our European friends are reluctant to accept any facts or ideas that point to the likelihood or even the possibility of a third world war. They believe that World War III, if it comes, will destroy everything they value, themselves included, and that the building of large armies somehow makes World War III more probable. Psywar planners have to learn to recognize such strong structures within the target audience, and to attack them by indirection.

An experiment by Knapp¹³ some years ago required college students to recall statements they had read concerning the expansion of Communism in Western Europe. There were two assertions, represented by equal numbers of statements: first, that Communism was gaining ground; second, that it was losing ground. The students who were opposed to the spread of Communism in Europe tended to recall better the statements that were anti-Communist, and vice versa.

SECURITY **RESTRICTED** INFORMATION

Studies of preelection and voting behavior by Lazarsfeld¹⁴ and others seem to indicate that strongly motivated Democrats tend to ignore Republican campaign propaganda, and strongly motivated Republicans tend to ignore Democratic campaign propaganda. A news story that treats the two viewpoints impartially, or presents facts favorable to both sides, runs up against a tendency on the part of each reader to seize upon the points favorable to his side and pass up those favorable to the other side.

The same behavior has been observed in rumor studies. Allport and Lepkin¹⁵ in one study showed that people who opposed the program of rationing during World War II were much more prone than others to believe and repeat rumors alleging extravagant use of gasoline by high officials, or extravagant use of butter at army bases, etc. Such rumors were thus given a more or less favorable reception according as they agreed or disagreed with strong structures that the recipients were trying to defend.

The meaning of all this for the psywar operator needs to be repeated over and over again. A psywar operator is taking a great risk, as far as getting his message across is concerned, if he makes a frontal attack on perceptual structures that are strongly held by members of his target. Better to canalize or divert: "We can agree on most things, but let me suggest something to you," "You have done fine so far; now the next step is..." Better to make a flank attack, or enter under a friendly banner. For example, the psywar operator is much more likely to get a favorable perception if he can quote a friendly authority or transfer a respected sanction to what he has to say.

Another implication for psywar is the great importance of reliable and valid intelligence concerning the target. You need to know what structures are strong. You need to know what symbols and sanctions you can call on for help, and what names, if any, you can call. Propaganda randomly planned in ignorance of such knowledge may well do more harm than good.

A third thing to remember is that we organize experience in terms of proximity and similarity and often confuse this with cause and effect. This is a way of describing another device we have for combining experiences for easier handling. We organize together things that come to our attention about the same time or that seem to us to resemble each other in some significant way. We are not talking now about events or things that are similar, or close together physically, but rather about those that are similar or close together psychologically. Now what we select as being close together psychologically will be determined in large part

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

by our needs, knowledge, and moods. Thus, as Krech and Crutchfield⁷ say, a child who has just been spanked may tend to organize "fathers, bullies, and castor oil" together as sources of pain and frustration. A mechanic may tend to organize power lawnmowers, automobiles, and propeller airplanes together because they all have reciprocating piston engines. A superstitious child may organize the fact that he failed to pick up a pin together with the fact that he shortly afterward had trouble with one of his friends.

This quality of perception has two important implications for psywar. For one thing it enables the propagandist to put labels on groups of people or events—"the do-gooders," "the economic royalists," "the Cliveden set," "the station wagon crowd," "appeasement," "imperialism," etc., without going against the usual mental habits of the target audience. That is, the propagandist can use a label in confidence that the similarities or proximities he directs attention to will dispose many members of the target audience to organize the persons or events together under the proposed label, without bothering to ask questions about the label.

Equally important for psywar is the fact that similarity or proximity often lead to a perception of cause and effect. The superstitious child who neglected to pick up a pin and then had a fight is likely to say that he had a fight because he didn't pick up the pin, although to other persons the two events may seem to have no connection with each other. The President who is in office during an economic setback or a humiliation in foreign relations is likely to be perceived as having brought them about, whether he could have done so or not. This works both ways, of course, and no President is likely to deny that he brought about or maintained peace and prosperity in the way his supporters claim.

For the psywar operator all this means that people aren't able, in the complex conditions of contemporary life, to look very closely at cause and effect. They therefore tend to see cause—or more precisely, causation—where there is only association or coincidence. More especially, they are willing to believe that someone whom they perceive as "bad" has been the cause of almost any "bad" event that has happened anywhere near him; or that someone whom they perceive as "good" has caused almost any "good" event. A rather startling piece of research on this point was done by Zillig¹⁶ in 1928. In this experiment, two groups of children performed gymnastic exercises before their classmates. The groups were carefully selected and trained. One group was made up of children almost universally liked, the other of children al-

ORO-T-214

59

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

most universally disliked, by their classmates. The liked group had been trained to make mistakes, the disliked group to perform the exercises without the slightest error. But when the audience recorded its impressions of the two performances, it was found that the mistakes had all been credited to the disliked group. This was not malicious or dishonest; it is merely an illustration of the way perception works. Acts thought to be "bad" are much more likely to be organized with persons thought to be "bad," and vice versa. The audience really believed it had seen the disliked children make those mistakes. The same thing happens in the technique of "guilt by association" or "innocence by association," when an effort is made to encourage people to perceive someone as "bad" by associating that person in our psywar output with something already perceived as "bad," or the reverse.

The Nazis seized upon the strategic opportunity this offers to propaganda and blamed most of the ills of the world on the Jews. The Communists have used it to put the blame for everything unpleasant on "reactionaries" or on the Western powers. They have been able to convince many people of a connection between disease in Communist Asia and the "bad" Americans, despite the fact that they had to call in something as farfetched as germ warfare to explain the connection.

This does not mean, of course, that coincidence can be substituted for causality with all people at all times. As we have seen above, there may be strong structures of attitudes and beliefs on the part of the target audience that it will refuse to give up. The great majority of the Germans during World War II were committed to the notion that Hitler was "good," and it would have been difficult to persuade them that he was responsible for their ills. (It proved much easier to hang the blame on certain Party men under Hitler.) Moreover, the more a person has been taught to be critical (this usually coincides pretty well with educational level), the less he is impelled by strong needs or drives to accept an organization uncritically, and the more likely he is to look behind the label or the suggestion and study the facts as he is able to get them.

A fourth thing to remember is that we organize experience in terms of the language we have to describe it. By this time, you should have a fairly good idea of what is meant when we say that a message may not mean exactly the same thing to the target that it means to the source. It will be clear to you that this difference in interpretation is not merely a matter of differing definitions of words. Rather it refers back to differences in experi-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

ence, differences in needs, and differences in knowledge. A person tends to read into a message what he wants to, that is, what helps him to preserve his strong structures of needs, understandings, and emotions, in a word, what fits with his previous experience.

Language is, of course, the chief tool we have to use in psywar, but the psywar man cannot remind himself too often that perception of language is always affected by experience. Katz¹⁷ points out that American civilians were at a disadvantage in communicating with returned servicemen after World War II because foxhole experience had no counterpart in unbombed America. Similarly, labor-management controversies are made more difficult by the fact that employers and employees have different ways of life. He says further:

The employer, owner, or superintendent, through his executive function of making daily decisions, and issuing orders and instructions, acquires a psychology of management. He can understand, though he may dislike, a union demand for more wages. But when the union requests, or even suggests, changes in the conditions of work or changes in personnel policy, he grows emotional and objects to being told by subordinates and outsiders how to run his own plant. For their part the workers have little understanding of the competitive position of the employer. Since the employer enjoys a way of life luxurious in comparison with their own, they find his plea of inability to pay a higher wage laughable.

If this is the situation among people who work in the same plant and live in the same city, how wide must the gulf of experience be between representatives of conflicting belief systems and widely different cultures, for example, Russians and Americans? That is why one valuable element in the make-up of an effective propagandist is the ability to think himself into the other fellow's shoes, and why there could be no better training exercise for the propagandist than a series of assignments that would make him assume the role of a member of the target audience. For example, an American trainee might be assigned to write the best papers he could possibly write, from the viewpoint of a Soviet citizen, on "why I love Stalin," or "Americans are warmongers," or "why I love my collective farm." For that is the kind of thing he will be doing, in effect, before every piece of propaganda writing he undertakes. The psywar man must try to develop genuine empathy with the target he is trying to reach; only by doing so can he be reasonably sure of conveying the kind of meaning he wants with the words he can use. This is considered further under Empathy in Chap. 7.

Another feature of language communication that is important for the propagandist is the fact that words sometimes separate

SECURITY **RESTRICTED** INFORMATION

themselves from experience altogether. We have very little time or opportunity, what with the busy lives we lead, to check words back against experience and reality. Words thus tend to become more than symbols and acquire a reality (and importance) of their own, quite apart from the realities they symbolize. Quoting Katz again:¹⁷

Viewed realistically, language as a living process has other functions than accurate communication. It did not arise in the history of the race, any more than in the development of the child, solely in the interests of precise interchange of information. Language as it exists is not the product of scientists trying to perfect an exact set of symbols; it is the product of an arena of everyday life, in which people are concerned with manipulating and controlling their fellows and with expressing their emotional and psychological wants. The prototype of language as a functioning process can be seen in the child's acquisition of words and phrases to extend his control of his environment beyond his limited physical reach. Similarly, adults use language to obtain sympathy, bulldoze their fellows, placate or embarrass their enemies, warm and comfort their friends, deceive themselves, or express their own conflicts. Language in operation is often intended to conceal and obscure meaning.

The psywar man must learn very early that psywar is not waged with "facts" but with symbols, and chiefly, as we have seen, with words. These words often acquire emotional loadings. They lend themselves to the propagandist's devices for gaining acceptance, such as the "plain folks" technique by which a message is prepared in a folksy way so as to impress the audience with its homespun and believable quality. They can tell falsehoods or fact with equal eloquence; they can illustrate a point or distract attention from it, or they can exaggerate or play down. In general, fact tends to lag behind the word, because the word is easy to use and the fact is hard to check. Therefore the words themselves can accomplish something, just as, on a different level, a series of unfounded charges in the newspaper will usually accomplish something—because the denial never quite catches up with them.

It is hardly necessary to point out that words, whatever the purpose they are being used for in a psywar operation, need to be words that will be perceived approximately as the sender wishes them to be. The magnitude of the task of choosing the right words for communication between languages (and therefore between the cultures that lie behind the languages) is illustrated by this account:¹⁸

Some of the great difficulties among the diplomats sitting around the international tables here (at the United Nations) arise from the differences in languages, alphabets, and consequently, ways of thinking; and in no tongue is more ingenuity required for accurate, precise translation than in Chinese.

SECURITY **RESTRICTED** INFORMATION

The Chinese ideograph script is one of the world's oldest written media, but the talk at Lake Success is so brimful of new ideas, new concepts, and new words that to translate even the basic Charter itself into Chinese it was necessary to devise almost 2,000 new combinations of characters.

A perfect example of the troubles faced here by Chinese translators is the word "uranium," which has a persistent way of cropping up in diplomatic reports. The translators went into a huddle and came out with a decision to call the atomic base "U-metal." That, however, only started their headaches.

The symbol for "U" was found in the Chinese word for grapefruit, which in literal translation is the "U-tree." What was just as disturbing, from a purist point of view, was the discovery that the symbol for metal was contained in the first part of the word for "bell," which, literally translated, meant "metal boy."

After some cudgeling of brains, however, the calligraphers came up with the proposal to shave off the "tree" part of the "U-tree" character, discard the "boy" part of the "bell" character, and then in the best manner of diplomatic compromise, join the severed remains to form a new symbol: "U-metal" or, as we would say, uranium.

One can easily imagine the difficulty of conveying the idea of an atom bomb to a cultural group that has no concept of either an atom or a bomb.

An individual's language is, of course, the product of the culture in which he was raised. More importantly for psywar purposes, language is a tool for getting along with the world, and the meanings that a language conveys depend on the kinds of problems encountered and solved in the recipients' culture. The person who tries to communicate with a person of another language will almost inevitably use some constructions or words that do not mean what he wants them to mean. The result is poor communication, or, in black propaganda, unmasking. Note the inept choice of terms in the last phrase of this sentence from a Japanese black leaflet: "It is advisable in such cases to take full protective measures by use of condoms, protective medicines, etc.; better still to hold intercourse only with wives, virgins or women of respective character." Or this unmodern use of the adjective "sweet" in a Communist leaflet dropped on American troops in Korea: "Cast aside all anxieties! Do not hesitate to surrender to the People's Army! You will then be able to meet again your comrades who have come before you, and soon return to your sweet home."

In all psywar operations that involve different languages, but especially when the language of the target country is dissimilar grammatically to English (or other Western tongues), it is important to have genuine experts in the language on hand—not to assure an accurate word-for-word translation of the English

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

message the propaganda writer turns out but rather to assure adequate communication of the idea intended. Languages differ greatly in the rules used to communicate similar ideas—witness the German use of gehen and fahren to distinguish "going-by-walking" from "going-by-being-transported." The Chinese have 17 different nouns referring to kinds of mountains—Tsou, high mountain, and Ngan, for high mountain near a river, for example. The Arabic language has more than five thousand different words referring to horses, and hence it is hard for a Westerner to make accurate horse sense to an Arab. The word "to cause" has no counterpart in the language and thought of the Trobriand Islanders, and its absence is reflected in the general lack of teleological concepts, and of purposiveness as well, in their culture; the idea of working-in-order-to-receive-pay (or other compensation) is without meaning to them, as are questions of "why?" (which they answer merely in terms of "that's the way it has always been"). In the language of the Arapesh of New Guinea, notions of time and time relations are similarly impossible to express.

What we are saying here is not merely that members of foreign cultures may lack an informational basis for understanding a communication but also that their language may lack the concepts—thought vehicles—necessary for them to learn how to understand. Thus it is clear that the propagandist's task in trying to communicate accurately and to avoid looking silly to his audience, in comparison, for example, to the American advertiser's task of choosing exactly the right word or phrase to sell a product, can be monumentally difficult.

Rumors and Perception

One of the best illustrations of how perception works, and also one of the aspects of human behavior that the psywar operator needs to understand most thoroughly, is the growth and passage of rumors. The most extensive work on rumor has been done by Allport and Postman,¹⁹ who have studied the problem not only by observing rumors in society but by setting up experimental rumor passages in the laboratory. One of the rumors they studied during the war had to do with a Chinese teacher on vacation who, shortly before Japan's surrender, drove his car into a Maine village and asked his way to a hilltop from which he could see a view that a tourist guide had told him about. "Someone showed him the way," say Allport and Postman, "but within an hour the community was buzzing with the story that a Japanese spy had ascended the hill

SECURITY **RESTRICTED** INFORMATION

to take pictures of the region."

What had happened? Someone told the story. It was told over and over again. And as it passed from person to person, three things were happening to it. So, at least, Allport and Postman¹⁹ concluded from their analysis of the case.

In the first place, it was being leveled. Details were being omitted:

The courteous and timid, but withal honest, approach of the visitor to the native of whom he inquired his way; the fact that although he was certainly Oriental, his precise nationality was unknown. Likewise not mentioned was the fact that the visitor had allowed himself to be readily identified by people along the way; and that no one had seen a camera in his possession.

In the second place, the story was being sharpened:

Having accepted their special interpretation of the Chinese scholar's visit, the rumor agents accentuated certain features while minimizing others. The sharpening of selected details accounts for the overdrawn dramatic quality of the final story. What in the original situation was Oriental became specified as Japanese; what was merely a "man" became a special kind of man, a "spy." The harmless holiday pursuit of viewing the scenery became the much sharper, sinister purpose of espionage. The truth that the visitor had a picture in his hand became sharpened into the act of "taking pictures." The objective fact that no pictures of any possible value to the enemy could be taken from that particular rural location was overlooked.

In the third place, the story was assimilated:

In the Maine countryside resident natives have had little contact with Orientals. Like most Occidentals they are unable to distinguish a Chinese person from a Japanese. They had only one available rubric for Orientals, firmly implanted in their minds by wartime news and stories: the "Japanese spy." No other category was available for the classification of this unusual visitation. A Chinese teacher-on-a-holiday was a concept that could not arise in the minds of most farmers, for they did not know that some American universities employ Chinese scholars on their staffs and that these scholars, like other teachers, are entitled to summer holidays. The novel situation was perforce assimilated in terms of the most available frames of reference.

This process—leveling, sharpening, and assimilation—seems to characterize the passage of all rumors. You can test it yourself, as Allport and Postman did, by playing a kind of parlor game: write a brief story; then whisper it word for word to a guest, who will whisper it to the guest on the other side of him, and so around the room. When the story comes back to you, compare it with the original. This has been done in the laboratory many times, in the transmission of both pictures (Fig. 1)¹⁹ and words, and the same general principles of perception seem to apply.

SECURITY **RESTRICTED** INFORMATION

Consider what was happening in the incident of the Chinese teacher. The villagers were trying to give the incident a meaning. They perceived those details that added up to a meaning, selecting some details, rejecting others, distorting some, adding some (for example, the camera). The important question, of course, is this: what controlled their selection? They were obviously selecting in terms of the frames of reference available to them (which did

Henry Holt and Company¹⁸

Fig. 1—How the Owl Became a Cat—Visual Rumor

not include Chinese teachers on vacation in Maine), and in terms of their needs, moods, and anxieties as of that moment. The war was much on their minds. Japanese were objects of fear, distrust, and hate. Protecting their country was a high value of great importance to them. Their suspicion of foreigners was of long standing. They had been exposed to the Government's campaign for security of information, to spy movies, to the knowledge that cameras were prohibited around defense installations. And all this added up to a frame of reference, in terms of which they perceived this new event. As Allport and Postman¹⁹ put it:

A yellow man—a Jap—a spy—photographic espionage. One idea led to the other with almost mechanical inevitability until the final conclusion emerged The three-pronged process of leveling, sharpening, and assimilation reflects the rumor agents' "effort after meaning." The facts of the situation, but dimly understood, did not provide the meaning that the strange visitation required. Hence a single directive idea took hold—the spy motif—and in accordance with it, discordant details were leveled

SECURITY **RESTRICTED** INFORMATION

out, incidents sharpened to fit the chosen theme, and the episode as a whole assimilated to the pre-existing structure of feeling and thought characteristic of the members of the group among whom the rumor spread."

Rumors are clearly an important weapon of psywar. But let us look at them here only in terms of the perceptual processes they illustrate and of what they mean to the psywar operator who wants to know how a message is likely to be received. For methods of countering rumors see the next section.

Countering Rumors

If you want to anticipate how an intelligent enemy will defend himself you can look at some of America's experiences in rumor defense during World War II. A good account of these efforts will be found in Allport and Postman.¹³

In general, this country used two kinds of defense against rumor. The government agencies preferred the indirect method of smothering rumors with facts, that is, it did not repeat rumors even for the purpose of refuting them. The theory behind this defense is (a) that "rumor flies in the absence of news" and (b) that to repeat a rumor even for refutation may spread it farther. Therefore agencies like OWI, when they learned of a dangerous rumor, would release facts in answer to it without ever mentioning the rumor.

On the other hand, nongovernmental organizations and civilians put their faith in rumor clinics, which chiefly took the form of newspaper columns or radio programs in which rumors were selected for ridicule and refutation. The theory here was to bring rumors out into the open into a climate of fact and understanding, where they could not flourish. Such evaluation and study of these rumor clinics as was made indicates that (a) there was no evidence that newspaper rumor clinics, filled with ridicule and negation as they were, actually served to spread any rumors farther; (b) however, it was regarded as possibly dangerous to print a rumor in bold-face type, or to repeat the rhythms and slogan-like qualities of some of the more effective rumors; (c) it was felt that radio rumor clinics were more likely than printed clinics to spread a rumor, because of the dial-twisting habits of American listeners; and (d) there was some slight evidence that the clinics impeded the spread of rumor, and no doubt whatsoever that they succeeded in making their communities rumor-conscious.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Along with these defenses, of course, there was a poster, newspaper, and radio campaign aimed at security of information. Typical slogans were "Think before you talk," "Enemy ears are listening," "Don't kill her daddy with careless talk." This is standing operating procedure (SOP) for any country at war.

Summary

For the psywar operator this material illustrates the problems he faces in trying to get his meaning across to the target. The fundamental idea is Lippmann's thesis that all men know their environment in terms of pictures in their heads, which are not exactly equivalent to the world outside. The question, then, is this: how do they form those pictures? That is the problem of perception.

We perceive the world in terms of its meaning to us. Thus, we structure experience—we select, distort, add—but we always structure it meaningfully and functionally. That is, we see things in terms of our needs, our previous experience, our moods. We organize experience so as to make it fit into our frames of reference—and especially so as to resist change in the structure of belief and understanding that we strongly hold. We tend to group bits of experience—people or events—in terms of their similarities or nearness. Finally, we organize experience in terms of the language we have to describe it. Evidently, therefore, different people will perceive different meanings in the same experience, so that it is essential to know as much as possible about the frames of reference, needs, moods, and language of a target if one is to predict with any confidence whether an intended meaning will get across. As one passage quoted in the chapter said: "There are no impartial 'facts.' Data do not have a logic of their own that results in the same perceptions and cognitions for all people. Data are perceived and interpreted in terms of the individual perceiver's own needs, own emotions, own personality, own previously formed cognitive patterns."

In reviewing this chapter the reader will also recall the bases in perception for many devices of propaganda, such as name calling, glittering generalities, transfer, testimonials, guilt and innocence by association, and folksy language; and for the way that rumors grow and spread, and the way rumors are countered.

Chapter 4

RESPONSE TO THE MESSAGE

NATURE AND GROWTH OF ATTITUDES

The message has been received. It has attracted attention and been perceived, by which we mean it has been given a meaning in relation to the other pictures within the recipient's head. Now the message begins to operate within the realm of attitudes.

Psychologists list attitudes among the intervening variables. They call them "intervening" because, they say, attitudes come between stimulus and response, and help determine the way the individual responds to a given stimulus.

Attitudes are not the only intervening variables. Intelligence, habits, and motives all get between stimulus and response in much the same way that attitudes do. In point of fact, attitudes partly depend, as we shall see, on these other intervening variables, and have no particular advantage as regards determining the nature of responses. But because attitudes are the evaluators among these variables—because they serve to classify the stimuli on the scale of favor-opposition—they are often more useful than the others in predicting what direction the response will take. The internal effect of a stimulus can often be described in terms of attitudes, and attitudes can either facilitate or hinder external behavior which arises as an effect of a stimulus. Therefore it is important for psywar operators to understand something about how attitudes are formed and changed.

What is an attitude? Let us define an attitude as an inferred state of readiness to react in an evaluative way, in support of or against, a given social stimulus situation.

Look at that definition, piece by piece:

an inferred state—We cannot see an attitude. We can only infer it from a person's expressed opinions or from his actions.
of readiness—Attitudes act like a steering wheel rather than an engine. The attitude is ready, but it doesn't start things. It

SECURITY **RESTRICTED** INFORMATION

steps in to guide the direction of response after the process under consideration has been set in motion by a stimulus.

to react in an evaluative way, in support of or against—This is the heart of the definition. Attitudes are concerned with the pros and cons—the relative values—of living. They represent judgments that have grown up gradually with experience. They are the built-in measuring sticks by which we evaluate new experience. They always have two dimensions: direction, by which is meant where they stand, in relation to a particular stimulus, on a scale from favorableness to opposition; and intensity, by which is meant how strongly they are held, how energetically the holder is prepared to act in the direction they point, how vigorously he is prepared to defend them, etc.

a given social stimulus situation—This completes the picture of attitudes as tools for coping with our complex social environment. Attitudes help us to classify and respond to the great mass of stimulation that comes constantly into our nervous systems from social situations.

How Attitudes Grow

Children's attitudes are unstable. Parents and child psychologists know that. Children are fickle. The things they like to do, and the people they like to do these things with, change easily and quickly. This is not surprising. In children the neuromuscular apparatus that mediates learning is not very well developed, and there is no large accumulated backlog of habits to help in the learning of something new. What this means in effect is that it is fairly easy for one day's learnings to be displaced by the next day's. Thus a child's attitudes are constantly shifting and, along with them, his interests and even his abilities, and nothing can put a stop to the shifting except the gradual development, within the child, of a pattern that carries over from one learning experience to the next. The social and psychological conditions affecting a child vary so much from day to day that it takes a long time for him to learn to respond consistently to similar (not identical) stimuli. That is, a child's reaction to Communism or Negroes or religion may be now favorable, now neutral, now adverse, and it takes many occasions for him to learn the kind of reaction that is to be dominant and is to become a stable and generalized part of his personality.

A second reason for instability of attitudes in children is that a child's whole personality structure is rather unstable. A child

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

can shift fairly rapidly from dependence to independence, from aggressiveness to submissiveness, from politeness to rudeness—and all of these in response to the same individual or situation as stimulus.

How, then, do attitudes become stabilized? The answer is twofold: (1) As other aspects of personality mature and become more integrated, as the person develops a consistent notion of himself and of the distinction between his own self and the outer world, attitudes become more consistent, and as they become more consistent they also become more completely integrated and perform more smoothly their function of supporting the rest of the personality in its complex relations with the environment. (2) As a child becomes older he adopts—by choice or by force—roles in various social structures or groups. It is through these that he gains his major satisfactions in life. Attitudes act in support of these roles and the structures of which they are a part. As he ages he becomes more closely allied with an increasingly consistent set of groups, and this helps stabilize his attitudes. (When attitudes remain inconsistent into adulthood, they often result in the development of neuroses, which reflect incompatible social needs and allegiances—a phenomenon that Horney¹ calls "the neurotic personality of our time.")

Basis of Attitudes

The Learning Process. Attitudes are learned. Indeed, the basic principles of learning apply not only to the growth of attitudes but also to the formation of the whole basic set of tools we use for living in society, that is, the personality. Thus it is appropriate to ask, How do we learn?

We learn by building up an association between a cue and a response. A cue is simply a stimulus that stands out from the rest of our environment, as, in an earlier chapter, we spoke of "figure" as standing out from background. We respond to a cue under the influence of a drive and we are, once we have learned, rewarded. That is the basic formula in terms of which practically all human and animal learning can be interpreted.

By a drive we mean a tension that impels us to action. We have biological drives such as hunger, and social drives such as the need to understand our environment. A reward is any state of affairs that reduces the drive tension. Food, for example, would reward us in terms of a hunger drive; it would reduce the drive. Without drives, people would be inert. Without rewards

can shift fairly rapidly from dependence to independence, from aggressiveness to submissiveness, from politeness to rudeness—and all of these in response to the same individual or situation as stimulus.

How, then, do attitudes become stabilized? The answer is twofold: (1) As other aspects of personality mature and become more integrated, as the person develops a consistent notion of himself and of the distinction between his own self and the outer world, attitudes become more consistent, and as they become more consistent they also become more completely integrated and perform more smoothly their function of supporting the rest of the personality in its complex relations with the environment. (2) As a child becomes older he adopts—by choice or by force—roles in various social structures or groups. It is through these that he gains his major satisfactions in life. Attitudes act in support of these roles and the structures of which they are a part. As he ages he becomes more closely allied with an increasingly consistent set of groups, and this helps stabilize his attitudes. (When attitudes remain inconsistent into adulthood, they often result in the development of neuroses, which reflect incompatible social needs and allegiances—a phenomenon that Horney¹ calls "the neurotic personality of our time.")

Basis of Attitudes

The Learning Process. Attitudes are learned. Indeed, the basic principles of learning apply not only to the growth of attitudes but also to the formation of the whole basic set of tools we use for living in society, that is, the personality. Thus it is appropriate to ask, How do we learn?

We learn by building up an association between a cue and a response. A cue is simply a stimulus that stands out from the rest of our environment, as, in an earlier chapter, we spoke of "figure" as standing out from background. We respond to a cue under the influence of a drive and we are, once we have learned, rewarded. That is the basic formula in terms of which practically all human and animal learning can be interpreted.

By a drive we mean a tension that impels us to action. We have biological drives such as hunger, and social drives such as the need to understand our environment. A reward is any state of affairs that reduces the drive tension. Food, for example, would reward us in terms of a hunger drive; it would reduce the drive. Without drives, people would be inert. Without rewards

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

they would either die (if they failed to satisfy such drives as that of hunger) or they would live a goalless and chaotic kind of life.

Under the influence of a drive, then, we respond to a cue and are rewarded. A hungry animal in a laboratory is given the choice of walking toward a white or a black card. If he walks toward the black card, he gets nothing. If he walks toward the white card he gets food. Soon he associates white (the cue) with food (the reward), and under the impulse of the drive (hunger) he learns to make the rewarding response (that is, to orient himself and walk toward the white card).

Most human learning is more complicated than that, but the general pattern is the same. A child learns to say "please" in the presence of a complex set of cues, including his symbols for the food he wants and the sight of it in his parent's hand. He is told to say "please." If he does so, he is given the food. After a number of such trials, he learns to indicate the food, say "please," and collect his reward. In other words, he learns how to reduce his drive, and when he has thoroughly learned the response we say that he has acquired a habit.

But how does he learn to say "please" to reduce other tensions, for instance, when he wants to go riding with his parents, or wants a nickel to buy an ice cream cone? This is a long step in learning. Exactly how it is thought to happen is a rather complicated and technical matter, but suffice it to say here that the process is one of generalization or habit spread, and of discrimination. After a child has learned to associate the response "kitty" with the cues from his kitten, he will probably call other small furry animals kitty also. Having learned to respond "daddy" he will probably try it on men other than his father. The more nearly similar the cue, the more likely he is to respond to it in the same way. And as a result of trial and error he will learn to discriminate or to refine his habit. That is, he will learn which adult human with trousers, shirt, and tie will reward him when called "daddy." Many trials are necessary before the child learns to discriminate even among such fairly simple cues as these. In more difficult social situations it is correspondingly more difficult to learn to discriminate the cues which stand for alternative courses of action, and to balance the rewards and punishments of related actions.

However, repetition alone is not enough to assure learning. An instance in which simple repetition was depended on without the other conditions for learning being met, for example, by rewarding the response, was recalled by Hovland,² Chairman of

SECURITY **RESTRICTED** INFORMATION

the Department of Psychology at Yale: "During the war a number of top advertising men developed a program which suggested every hour on the hour 'Hate the Germans,' but I could never diagram the relationship between that stimulus and the desired response to make sense in the form of a learning paradigm, and I'd predict no desired learning did occur." In this case, no matter how familiar the three words became, there was very little likelihood that they would arouse any of the desired emotion in their hearers.

You can readily see some of the implications of this learning process for the practice of psywar. For example, you want a given target audience to learn the habit of listening to your psywar radio broadcast. You know that if they listen and are rewarded, they will be likely to listen again. If the reward is fairly regular, their response is likely to become habitual. If they are not rewarded, they may not try again. If they are rewarded the first time, but not the second or third, their impulse to respond will probably be extinguished; that is, they will quit listening. But how does the operator make sure that they will be rewarded for listening? He looks for their tensions or drives. What can be done to reduce those tensions? Are they nostalgic for the old music which the Communists have barred? Are they frustrated soldiers lonely for the sound of a young female voice? Are they perplexed and in need of reliable news? The operator's job will be to plan his programs so as to meet those needs, reduce those drives.

Of course, this itself is a rather elementary piece of learning. What is really desired is to teach them more complex responses, in a more complex field of social and political cues. This is discussed in the following paragraphs.

The Developing Personality. A human infant does not exist as a person; he has no self. Even though he may be different from others in strength and loudness and frequency of crying and may be the dearest thing in the world to his parents, he still—as one psychologist has expressed it—"floats about in an undifferentiated absolute." He has learned next to nothing from his environment; he is highly nondiscriminative with respect to the cues he responds to; his behavior is quite general. But as he grows, his biological equipment becomes better organized. He is able to learn from experience, and he does so.

Slowly there develops (we can only conjecture this, for infants cannot talk and tell us about this) a vague distinction between "me" (self) and "not-me" (not-self). When he pinches his toes, there is

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

stimulation in the toes and the fingers as well, but when someone else pinches his toes, there is stimulation in the toes only—a different situation. As a result of turning, crawling, and falling, the infant encounters stimulation from the environment; each stimulation has in common with all the others the fact that it comes to "self," the same place.

After about a year the child acquires language responses and can begin to use symbols to stand for things. By the time (usually around age two) he is able to respond consistently to a symbol which stands for his own body—his name—it is possible to ask some interesting questions: Where's Johnny? The child will probably point to his nose or chest, somewhere along the line of maximum stimulation. Touch the child's hand and ask: Is this Johnny? The answer is commonly No. Is this Johnny's hand? Yes. Yes it is Johnny's hand, but it is still not a part of Johnny the person. He is vague about himself; he hasn't had enough trials to learn that all parts of his body are parts of the thing to which the symbols Johnny or "I" attach. The discrimination between self and not-self is poor and is not usually very clear until about five or six years of age.

After this time, when the child knows himself, there comes often a negativistic period which is so frustrating to parents and of great interest to psychologists. Having at last learned to discriminate "I" (the self), he begins to value that self (for it brings him a good many satisfactions). He plays with this new knowledge. It never stands out more sharply than when it is resisting the wishes of his parents. The self consists now of a good many things besides the child's body; it includes the habits he uses to gain particular ends, and it includes the drives these habits serve. And, in a figurative sense, it comes to include certain external objects that are important in his habit and motivational systems—his toys, his playthings, his parents, and, occasionally, his brothers and sisters. He reacts to these as though they were part of himself; they are important and are to be defended nearly as much as the symbol that stands for the self as a whole. And the symbol, the given name, for self becomes very important; it is the object of the attentions of others and is directly involved in the punishments and rewards the ego receives. "I" can have feelings hurt at the age of five, but hardly at age three.

This is where repression becomes important. Repression is the process whereby certain responses are forgotten and kept from appearing in overt behavior. Perhaps a case summary will illustrate it best.

SECURITY **RESTRICTED** INFORMATION

An aviation cadet in pilot training was having considerable difficulty in passing his check flights, flights on which he was accompanied by an instructor. Although this was not uncommon in training, this particular case was interesting because on solo flights the cadet was observed to do very well in every respect. But when there was an instructor checking him in the other seat he flew roughly, didn't locate his check points, and performed several dangerous operations. Being strongly motivated to pass, he eventually came to the attention of psychologists at the base. About a dozen interviews finally revealed that the boy had a very strong hatred of his father. This hatred was completely unknown to him beforehand, and much difficulty was encountered in finally bringing him to recognize it. His problem in check-flying seemed to be that he was reacting with antagonism and fear to the instructor (though overtly he said he liked the instructor and got along well with him) as though he were his father. The hatred of his father had been repressed so that he for years was unaware of it; yet the emotional aspect of the hatred persisted and in a number of areas involving persons in father roles had been erratic and generally unsatisfactory to all concerned. (Notice here the operation of stimulus generalization.) After he had made the recognition of the hatred he was able to discriminate between the instructor and his father and was no longer erratic in check flights, eventually passing the course.

This is the outcome of repression. Repression is a learned adaptive response. The boy in childhood had expressed hatred for his father and was punished because our culture does not sanction father hatred. He then expressed nothing in the presence of paternal injustice and was rewarded for "being a man," "exercising self-control," and the like. When he expressed favorable attitudes toward his father, the rewards were even greater. Drive: fear. Cue: father (or symbols of him). Response: active inhibition of hate reactions and favorable verbalizations. Reward: release from fear. Hundreds of trials enabled the boy to learn a favorable attitude toward father (who undoubtedly had some redeeming features). But he could not—or at least did not—unlearn the un verbalized emotional reaction.

Why do we make special mention of repressions? Notice what happened to the cadet when repressed drives were aroused. His behavior was disturbed. If, through anthropological studies or other sources, a psywar operator can learn the nature of the strong repressed drives within the target audience—the ones that are widespread enough to be called "cultural traits"—then he has

SECURITY **RESTRICTED** INFORMATION

an area of operation par excellence. The practical problem remains then to devise the stimuli that will arouse those drives, and others, and direct them for or against the objects or conditions that it is the mission of psywar to affect.

This sort of thing was attempted in connection with World War II propaganda against the Japanese. Anthropological data were interpreted psychoanalytically to indicate that the kind of training given most Japanese males, that which produced their well-known devotion to the authority of the Emperor, was highly repressive training. Each child went through a period of comparative indulgence during his first year. Authority in the form of the father was then invoked, and the child's status was sharply altered. The antagonism thereby generated toward the father tended to generalize to other authority figures but by severe punishments was repressed, while more desirable responses were substituted for it. The basic antagonisms remained but were repressed, and the child's need for security and freedom from fear was satisfied by approval conferred by authority figures. Now the problem for psywar was to find the stimuli which would arouse antagonisms toward certain authorities without at the same time evoking the stereotype devotion to national figures and symbols.

The validity of the above interpretation of the Japanese, and the effectiveness of the propaganda based on it, are still matters of conjecture. That the mechanism of repression is important in individual behavior problems is no longer questioned. But it remains to be established whether or not propaganda programs made up of stimuli coming from outside a target country can manipulate it successfully.

Development of Social Relations. Most learning and most personality development take place in social situations. Repression is a social product. Therefore let us look at the way a child's developing social relations affect the growth of his attitudes.

Of what importance are group experiences and group membership to the developing personality?

In the first place it is only in the group that a person can encounter language. Language is a uniquely social product. The child learns symbols that stand for the things he plays or works with; he learns symbols for the other people in some group; he learns symbols for what he does and what the others do; he learns symbols that stand for himself and help him to discriminate between himself and things that are not himself. It is the presence of the language symbols that makes possible the discrimination

SECURITY **RESTRICTED** INFORMATION

of his role in the group. Through language he understands the relationship of others to him, for example, in this form: "If I write on the wall, then Mommie will scold." This process of knowing what the next person is going to do in response to one's own action is of the greatest importance in the process by which a child becomes a fully socialized and certified member of a group, and thus in the formation of the child's self. Without language this indispensable communication, which defines roles and figuratively cements the group together, could not take place.

Another consequence of group membership is that there is assured for the child a consistent set of conditions in which the principles of learning can operate. The group provides him with consistent cues. The group provides avenues and facilities for responses to cues. And the group, most importantly, assures the operation of a fairly consistent set of rewards and punishments for responses. This is the most fundamental function of a group, speaking psychologically. It is the existence of a set of consistent cues to and consequences of motivated action that makes possible the assumption of roles and the first steps toward the learning of language.

Through behaving as a group member, then, the individual is enabled to learn three important sets of responses: (1) language responses, which allow communication and facilitate the discrimination of self from others, (2) instrumental responses, or the specific need-meeting skills the individual requires in order to perform his role, and (3) drive-producing responses. The last two classes of responses taken together embrace everything that is included under the label of "personality," and a good many other things as well. Let us emphasize the fact that in the group the person learns most of those responses and drives that outwardly distinguish him from others, and inwardly differentiate him from his others and enable him to know his "self."

Roles. Several times now we have mentioned "roles" and "role-performance." These are a natural outcome of group living. Groups, as we have seen, are organized and repetitive sets of relations between people. In order for a group to exist, therefore, it must be possible for its members to count on each other to do certain things (such as, in a family, washing dishes) and not others (such as changing the oil in the family car). The efficiency of the group and hence the mutual values derived by the members from the group's existence would be impaired if everyone did or tried to do everyone else's job and did not learn to do a particular thing well—and regularly. Family life suffers if

ORO-T-214

79

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

the five-year-old children insist on doing the cooking and house-keeping or if the mother spends all her waking hours playing cards. Certain things must be done so that the group is able to provide satisfactions for its members and hence to exist. These things, peculiar to the various members, are called "roles."

From the standpoint of an individual the function of a role is to bring consistent satisfaction to consistent motives. From the standpoint of the outside observer of the group the function of roles is (a) to "socialize" the new members and ultimately (b) to cause the members to contribute to the continued existence of the group.

People come originally to occupy positions and to assume roles partly because they are born into an already going society and partly because they recognize roles and positions as means of satisfying motives already acquired. A child born into and growing up in a family finds roles already set up for the existing members. It is in and through role-taking that a person becomes "socialized," learns the ways and means of the group, learns a language, and "interiorizes" a set of values. In fulfilling the role prescription for "child" (whether it be "child in a family of ten," or "only child"), the young human being learns, as we have said, to differentiate himself from the others making up his social environment. And with the development of language he is better able to learn labels for himself, such as "good boy," "older brother," or "tough guy," and to use them as guides in his various role behaviors.

Roles gain in importance with time and become to some extent independent of the immediate group structure. Roles become a part of the person's ego structure, serving not only as a set of tools for providing life's rewards but also as a set of values.

Roles have also the related functions of bringing the person in contact with the cues and the incentives that trigger the motivational systems acquired earlier. At the same time they provide a channel for the satisfaction of these motives. Proper role-playing (meeting role prescriptions) ensures the maintenance of the individual in his position in the social structure, which ensures the meeting of personality needs (as for dependence or dominance), and at the same time ensures survival not only socially but biologically. Small wonder then that roles should become values in themselves. Witness how, when you ask a person who or what he is, he is likely to name some role, such as professor of olericulture, or plumber, and is likely to defend rather strongly the importance of olericulture or plumbing "in the modern world."

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Role-taking integrates the person with others in his group. In addition to providing the individual with a personality and a set of values, organized around his major roles, role-taking has significant effects in relating the individual to other aspects of his groups. One such effect is called by a sociologist "taking the role of the other," which means being able to predict what others in the group are likely to do in given situations. Thus, a child gradually learns what his mother's functions are and can anticipate mother's responses to his own behavior. Such ability to take others' roles is the basis of good social adjustment; the social world becomes more familiar, and the person isn't constantly presented with surprising and often threatening reactions on the part of others.

An outcome of knowing what others' roles are is the learning and valuing of the common behaviors of one's group. Just as one's own role patterns become the normal and true way of behaving, the values that are common features of the role patterns of one's associates become commonly valued and commonly defended. To illustrate: it is "normal" in a statistical sense for each Mohammedan child to avoid pigs. Thus it becomes a shared norm and a shared value and is meaningful as a basis of communication only to the extent that it is shared.

Special kinds of attitudes are formed in relation to roles. The storekeeper is ready to act in certain evaluative ways toward the customer. The customer is ready for certain actions toward the storekeeper. Both expect certain actions from one another, and each expects the other to have certain attitudes toward himself; the storekeeper is deferential, and the customer expects him to be so. The customer knows he has certain rights and privileges and knows that the storekeeper knows this too. Both parties thus have definite expectations about one another, and each is ready to act toward the other in particular ways.

Role attitudes are a matter of being ready to act toward others in particular ways. They are therefore very important in the operation of groups. They are actually a part of the role prescribed for the person as his part of the group process. Without them the group does not function well—as witness what happens when a new person joins a committee. There is hesitation and caution until the new person finds an appropriate role for himself and learns what the others' roles are. After that, when everyone knows approximately what to expect of others and what others expect of him, the work of the committee speeds up.

To the extent that one's roles are limited to a very few situ-

SECURITY **RESTRICTED** INFORMATION

ations or relations, one's personality tends to become standardized. There develops in bureaucrats, for example, such a pattern as one investigator has studied under the name "bureaucratic personality." The professor tends to act like a professor, the executive like an executive. They carry these action patterns even over into activities that are not occupational; for example, the professor tends to act like a professor even when he is buying groceries or on a camping trip. And with these roles go, inevitably, certain supporting attitudes. The professor carries favorable attitudes toward patience and thoughtfulness and careful attention to detail; the executive carries favorable attitudes toward quick, decisive action and forceful efficiency. These attitudes are generated within the roles that these individuals play. They act to support the individuals in these roles, and the institutions of which the roles are a part.

Summary

Attitudes are learned. They are learned, like the other personality tools that help us to adjust to our environment, by discovering which responses to which cues will be rewarded. They develop as personality develops and as we learn to play our roles in society. They develop in such a way as to help us protect or express the enduring aspects of personality, and the rewarding patterns of social relations. Thus they represent evaluative judgments on the likely results of given behavior, and they serve as signposts of responses we are likely to make. Their signs, for the most part, point toward one kind of response, that is, they predispose us to action that will reduce our biogenic or emotional drives, preserve the values we hold, support behavior allowing us to use resources we are proud of, help us structure experience meaningfully, support our role concepts, and preserve our group norms.

Therefore the process of attitude formation begins with the individual's first breath and continues throughout life. His attitude structure, unstable and shifting at first, grows increasingly firm as his personality develops and he finds his place in society. It is into this long-continuing process inside each member of the target audience that the psywar operator sluices his message. The message must go through the same process as the countless other stimuli that have entered into the formation of the audience member's attitudes; that is one reason why it is important for the psywar planner and the psywar operator to understand some-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

thing of the learning process, briefly described in the preceding pages. The new message will enter into a situation in which there are old, firm, accumulated attitudes and also relatively new and less firm attitudes. There will be attitudes that are strongly held and others not so strongly held; in general, the more an attitude tends to support the strong structures, the enduring aspects, of the personality, the more likely it is to be held strongly. But there will also be some strong attitudes that have been repressed and are never consciously expressed.

Without anticipating the subject matter of the following sections, it can safely be said here that the psywar message is likely to be accepted more easily if it follows the general direction of existing attitudes. If its purpose is to change attitudes, then it will be exceedingly difficult to change those that are old and strongly held. It will have more success if it works in the area where attitudes are new and not strongly held, though this, of course, is always a matter of more or less. If it can arouse some repressed attitudes, it may succeed in disrupting a personality or a group. If it can give protection to repressed attitudes that are about to be brought out into the open, it may prevent the disruption of a personality or a group. Whatever its purpose and its area of operation, however, the psywar message must be designed to take full advantage of the learning pattern. That is, it must present itself as a cue, a certain response to which will be rewarded. To say it another way, it must be so devised that, if the target individual responds in a certain way to the cue, one of his drives or tensions will be reduced. And if the desired response is really to be learned, it must be practiced. Once will not be enough.

But before this is discussed further, we had better talk about the kinds of attitudes that develop and how these different kinds of attitudes may enter into psywar plans should be considered.

KINDS OF ATTITUDES

We have talked about the growth of attitudes in general and have said that they tend to cluster around the basic aspects of personality, predisposing us toward action that will protect or express those basic aspects. It will be useful now to discuss some of these clusters of attitudes and to suggest how psywar planners and operators may take each of them into account.

SECURITY **RESTRICTED** INFORMATIONAttitudes Based on Biological Drives

Under normal conditions, the biological drives, such as those toward rest, food, water, air, general activity, or the elimination of waste products, do not play a significant part in determining attitudes, mostly because these drives are for the most part so easily satisfied. It is true that in infancy such drives have a relatively large hour-by-hour influence on behavior and attitudes because the very early years are concerned especially with learning appropriate ways of meeting such needs. Some psychologists and anthropologists believe that many long-run effects on behavior, including attitudes toward authority, stem from the early period during which the child learns to control eliminative functions and other biological drives. But normal living conditions in practically all cultures are such that these basic biological drives are reasonably well satisfied through habits and institutions, so that variations in them only rarely have a significant effect on attitudes.

Take, however, a battlefield, or an area which has just suffered heavy bombing, or any situation where society, or the current social structure, does not provide for reduction of the biological drives. They may suddenly become so strong and insistent that the other so-called "learned" needs are laid aside. Then attitudes may be adapted that support action tending to satisfy the now-dominant biogenic drives.

Here we may draw a useful distinction between sociogenic and biogenic needs and take note of the fact that biogenic needs usually predominate when the chips are down. A study of the effects of starvation was made at the University of Minnesota during World War II, using conscientious objectors as subject participants. Thirty-six conscientious objectors volunteered to be subjected to systematic semistarvation for a period of six months. During this time they lost, on the average, about 25 percent of their body weight, and with the resultant physical changes went psychological concomitants that are of great interest for psywar. For the subject participants knew they were perfectly safe from external harm, were being carefully observed for possible serious consequences to their health, and could terminate their participation in the experiment at will, so that in many respects they were not nearly so bad off as people in a bombed city or a prisoner of war (POW) camp. We might therefore fairly expect the things that happened to them to happen on a much larger scale in bombed cities and POW camps. (Last winter's news stories from Kojima Island are worth rereading in this connection.)

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

The Minnesota experiment shows how, under conditions of continued starvation, the effects of years of acquiring social habits and values rapidly drops away, exposing a core of self-preservative, biogenically oriented motivation. Keys and co-workers express it this way:³

As starvation progressed they became more and more silent, apathetic and immobile. Movements were slow and restricted; stairs were mounted one at a time and the men sat or stood leaning against a wall while waiting. In discussion there was no evidence of confusion of thought or difficulty of expression but the attitude was frequently irritable and morose. Trivial incidents were productive of exaggerated annoyance and complaint. Favorite topics of conversation were food, farming and rural life, a fact which was bitterly resented by some of the men.

A frequent complaint was the sensation of being "old."

A number of men were bothered by vivid dreams, particularly of dreams of breaking the diet, with attendant great remorse.

Some of the men were unable to remain on the restricted diet clear through the experiment, despite the fact that considerable interest in the experiment had been aroused in various parts of the country and considerable prestige attached to being a participant in it:⁴

This deterioration of their ethical control was all the more remarkable because these men had shown themselves to be sincere and upright throughout the two or more years of work they had performed in civilian public service before coming to the laboratory. . . . The semi-starvation pressure of hunger was, however, too much—their very beings revolted against the restriction. One of the individuals not only bought food, but also stole some from "locked" storerooms. Another individual sublimated his food cravings by stealing china cups from coffee shops. Although fasting is said at times to quicken one spiritually, none of the men reported significant progress in their religious lives. Most of them felt that the semi-starvation had coarsened rather than refined them, and they marveled at how thin their moral and social veneers seemed to be.*

The intensive preoccupation with food interfered with other activities and occupied most of their leisure time. Work efficiency was cut down, interest in their girl friends all but disappeared, and a common recreation was the planning of how best to enjoy the next meal. Cookbooks became fascinating literature for some of them.

As for their social life per se, there was a decreased interest in other persons, especially persons who were not a part of the starvation experiment. The men built up a strong in-group feeling that excluded practically everyone else, and there was little or no concern with courtesies, with consideration for others (even within the group), or with personal appearance.

*Reprinted by permission of author and publisher.

SECURITY **RESTRICTED** INFORMATION

Reports by observers of other nonexperimental conditions of food deprivation confirm even more vividly the breakdown of well-established value systems with their supporting attitudes, and their replacement by the persistent striving after food. In occupied Germany, one poll of young women showed that they were too much concerned with food to be interested in love and affection. Women and girls of nearly all ages and classes prostituted themselves in return for bits of food. Careful dietary habits and long-established food tastes disappeared completely, and personal and group loyalties weakened or vanished in the quest for food.

In short, even the strongest attitudes toward the institutions of one's society will be shaken or abandoned if those institutions fail to meet such a basic need as that for food. This sometimes provides psywar with great strategic opportunities. It can step into such situations with pictures and words relating to the unsatisfied need and be sure of attracting attention. It can call upon the target audience for behavior x and be pretty sure of success if x promises satisfaction of that need as a reward.

Sex as a biological drive attains importance under conditions of deprivation but only when activities motivated by stronger drives such as hunger do not interfere with sexual preoccupations. Wars being run the way they are, it is impossible for the commanders of an army to see to the satisfaction of all the needs of their men. Even "militarily healthy" troops on full rations are likely to be sexually deprived and hence susceptible to psywar appeals stressing sexual materials. Most particularly, pornographic psywar material may have an effect on attitudes through the mechanism called "projection"; sex-hungry soldiers are highly vulnerable to hints or assertions that their women are being unfaithful, and that "4-Fs" and others not really caught up in the war, high officers, government officials, etc., for example, are enjoying their favors. Their own needs are "projected" onto others at the suggestion of the psywar leaflet.

This was the psychology behind the Nazis' use of a pornographic piece featuring a Jewish figure leading "your girl back home" astray, a double-barreled appeal for the sex-hungry anti-Semite.

Pornographic propaganda is, however, more often successful in attracting attention than in eliciting overt action. For the latter purpose the sex drive is a far less effective mechanism to play on than hunger, especially when the psywar operator is in a position to hold out a promise of early reward for the drive for food. True, men will respond, under certain conditions, to surrender leaflets emphasizing the opportunity to get back to the sexual and

SECURITY **RESTRICTED** INFORMATION

other satisfactions of a peaceful homeland. But the combat psywar operator should remember that the sex drive is likely to be dormant among hungry troops and that, in any case, other aspects of personality may oppose extramarital gratification.

For psywar purposes, then, it appears that, first, efforts to change attitudes through appeals to the biological drives of militarily healthy troops cannot be counted upon to produce great results; second, with troops or civilian populations whose food supply is very low, appeals based on hunger motivation may be extremely effective; and third, when the chips are down, biogenic needs are going to predominate over sociogenic ones; that is, it does no good to propagandize a hungry man about democracy if your rival is able to offer him food.

Attitudes Formed in Defense of the "Self"

One's self, it has been said, is "the individual as known to the individual." Each person can discriminate between his own body and its behavior and the bodies and behaviors of other people. He knows to some extent his own resources of skills and attitudes and how they can help him to get along in the world. He also has certain ways of doing specific things that are characteristic of him and set him apart from others. For example, some pay the check at a restaurant grudgingly, others take time when paying it to be friendly and "sociable," still others pay it methodically, counting the money carefully and noting and filing the receipt, etc. These resources of skills, and these characteristic ways of carrying out specific acts are variously useful to the person who thus cherishes them and moves to protect them when they are threatened. Thus the self is a value—a complex of specific values—as well as a pool of adjustive resources. And by definition, values are things that we strive to preserve.

One way the individual can preserve his values is to act in defense of the other persons, the groups, and the institutions that are committed to their preservation. That means he must hold attitudes appropriate to such action. One function of an attitude, then, is to provide a basis and guide for action through which the values of the self may be maintained. Suppose, for example, that you have a considerable dependence on religion. That means you value religion and will develop attitudes predisposing you to act in defense of certain religious institutions and their representatives (church, priest, pastor). Now suppose that enemy psywar attacks your church. Your attitudes are likely to set up a rigor-

SECURITY **RESTRICTED** INFORMATION

ous defense. But suppose on the other hand that you are a North Korean Christian, and the Communist regime has taken your church's land, arrested your minister, and made it difficult for you to worship. And then suppose anti-Communist psywar directs your attention to what has happened, denounces the Communist regime, and suggests that you take certain action against the Communists. Are you not likely to react favorably to that propaganda? Religious groups, then, are obvious friendly targets for psywar operations against Communism.

Look at it from the other side of the world. Suppose that you are an American Negro. Suppose that your "self-respect," that is, the attitudes that you have developed in support of your "self," has often been wounded by the actions and culture patterns of white Americans. And suppose that Communist agitators or Communist psywar publications come to you, speaking of "equality," denouncing the treatment you are getting, and inviting you to join a movement that promises you more "self-respect." Are you not likely to look with greater favor than you otherwise might on that propaganda? That is why minority groups in non-Communist countries are favorite targets for Communist psywar.

Or suppose you are a German, and your country is under occupation. You have developed a high skill at printing—designing a page, setting type, imposing it on paper. You have often been praised for this, and you value the skill highly. When the occupation authorities come in, you offer your services as a printer. But you are told brusquely that the printers for the occupation forces have come along from America, that no German printers are needed, and that if you want a job you can start cleaning the rubble from the streets. What is your reaction likely to be? You will be frustrated. Your characteristic skill is being denied expression. You have no opportunity to describe yourself as an artist printer. Your reaction will probably be to oppose the occupation people and resist all their consolidation propaganda. Suppose, on the other hand, they recognize your skill, use it, praise you. Then how might you react to the occupation?

We are not saying, of course, that all consolidation operations should as a matter of course employ native labor. The point is, rather, that propaganda whenever possible should provide for "selfish" behavior, that is, behavior through which the major characteristics of the self can be expressed. Let us take one more example. A basic characteristic of the Chinese personality seems to be respect for the past and, especially, for the great men of the past. One device of anti-Communist psywar in China has

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

therefore been to try to convince the Chinese that the present Communist regime is traitorous to the ideals and heroes of the past, particularly to such leaders as Sun Yat-sen, who has for many years been a symbol of particular importance in China. It thus gets on its side, or tries to, the attitudes the Chinese have developed in defense of the self, and action against the Communists is made to appear selfishly rewarding behavior.

Ego-involved Attitudes

"Ego" is a term used to refer to the most highly valued and protected aspects of the self, those behaviors most intimately associated with one's first personal pronouns. If "I" am a career psychological warrior, I will more highly value my skills in planning psywar operations or writing leaflets than my golf playing or automobile driving. For "I" am a psywar operator, not a golfer or cab driver.

An ego-involved motive⁵ is one whose process of satisfaction evokes responses from other people that are evaluative of one's self. As a career psywar operator I should be very ego-involved about turning out a good piece of propaganda, for, in so doing, others are going to react evaluatively toward me, evaluating my competence. I will be very defensive of this competence, and it will be difficult to convince me that I have done poorly. "I" will not care so much if my golf score is surpassed or my car driving criticized.

An attitude is ego-involved, then, to the extent that it supports actions that will ensure "good standing" for one's ego. The social scientist is likely to be strongly for support of social science research, just as a parent is for his son. Why does a political candidate kiss or praise babies? Because that will help to evoke favorable attitudes from the ego-involved parents. The German printer we talked about in the previous section held ego-involved attitudes toward his printing.

Ego-involved attitudes are therefore only an intense variety of the "self"-centered attitudes we have been talking about. The psywar man should recognize that such ego-involved attitudes are very hard to change. A psychotherapist could testify that such a change requires major revision of the stablest aspects of personality. Wherever possible, then, psywar should try to direct and make use of such attitudes (as the candidate praises the babies) rather than try to change them.

SECURITY **RESTRICTED** INFORMATIONAttitudes Supporting Group Belongingness

Most of the motives under the influence of which we operate are not biological drives but are acquired (or learned) through our contacts with other people. We are scarcely aware of the great importance our group involvements have for us, or of the loyalties we develop toward our several groups and institutions. But if our group is threatened we become acutely aware of its importance to us, and our attitude toward it is manifested in the form of a strong "pro-" feeling. We develop also a parallel attitude of opposition to the source of threat. You see an example of this whenever our families or our towns are criticized and especially when our country finds itself in a tense situation with another powerful country. Consider how American attitudes, since the Communist situation has grown worse, have arisen in defense of America and against the Soviet Union. If you were a Communist propagandist, what would you do about those strong attitudes? You would probably try to divert and diffuse them, wouldn't you? You would probably try to get Americans fighting among themselves, defending their own groups within America, rather than taking out their aggressions on the Soviet Union. This is what the Communists in fact do.

Thus, the function of attitudes in relation to feelings of group belongingness is, again, to favor action in support of these needs and of the groups concerned. In making use of this kind of attitude, psywar should wherever possible try to elicit positive reactions rather than buck negative ones. For example, to tell an enemy soldier or sailor that there is something wrong with his company or his ship's crew would merely be to invite a defensive reaction in support of his group. But if psywar can get across the idea that the enemy regime is not treating the people at home right, then there is some hope of getting the strong group attitudes working on one's own side. For example, America's Far East psywar has tried to convince the Chinese troops in Korea that all is not well at home and that the Communist officials in China are taking undue liberties in the villages. America has, in other words, tried to get the home group loyalties of the Chinese troops to work against their loyalties to the Communist armies and their Communist commanders.

Attitudes Related to Need for Structure and Understanding

The best sowing ground for rumors is a situation that is vague

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

and indeterminate. This you will recognize from your own experience. People get accustomed to living in fairly predictable circumstances. They like to live that way and feel uneasy when they don't know what the score is, when they can't tell with some certainty what the next hours or days are going to bring or even whether they are going to bring anything at all. Everyone needs to have some understanding of his world, even if the understanding is fleeting or is in the form of a label. (Note, for example, how some physicians give a name to an unknown condition, such as a "constitutional psychopathy" or a "systematic invasion," so that the patient may feel that he understands and thus is in control of his situation.)

People, we are saying, need to structure and understand their world, and attitudes are not-too-hard-to-erect signposts to guide their behavior and thought in that direction. If something can be shown to have "caused" an ambiguous state of affairs—a confusion of orders, or a lack of instructions—this somehow gives the state of affairs meaning for people and lets them put the blame for it on someone. The blame, furthermore, can be verbalized in the form of adverse attitudes, and these, as indicated above, then serve as guides to other action such as grumbling, complaining, writing letters, deserting, etc.

An ambiguous situation, that is, one where there is a minimum of information to help people understand their immediate experiences, thus gives the psywar operator a real opportunity to be, for the moment at least, the master of destiny. It gives him a chance to plant his own information, start his own rumors, provide his own explanations and answers, and so organize the experience of the target as he wants it to be organized.

Attitudes Related to Emotional States

Emotion has been defined by one psychologist as "an acute disturbance of the individual as a whole, psychological in origin, involving behavior, conscious experience and visceral function." Strong emotional reactions have the power to disrupt most on-going activities, just as too much power suddenly added to a machine may strip the gears. If, for example, a person perceives a stimulus situation as threatening or very pleasing, the emotion may release in him hormones that have the general effect of preparing him for strenuous activity if such is necessary, and what he is doing at the moment may as a result be done badly or even abandoned. Psywar often deliberately evokes strong emotion in

SECURITY **RESTRICTED** INFORMATION

the attempt to undermine attitudes. For example, it evokes fear in order to break down attitudes of group loyalty and respect for authority and to cause otherwise dependable soldiers or civilians to do things they would not conceivably have done otherwise.

Fear and anger are the two emotions that are of greatest importance to psywar. These emotions, like the biological drives, can energize and sustain action. Fear certainly does so in panic situations.* There is one great difference, however, that psywar operators must bear in mind. The stimuli that arouse biological drives (for example, hunger) are inside the organism, whereas the stimuli that arouse emotions (for example, fear or anger) are outside the organism. So also are the conditions that can lead to the reduction of each. That means that the psywar operator can hope to control the stimuli that turn emotion on and off in a way that is out of the question with the stimuli that turn biological drives on or off. Playing on emotional attitudes is therefore a simpler and more promising psywar mission than playing on attitudes related to biological drives.

In some situations, of course, the psywar operator will seek not to arouse and activate emotional attitudes but rather to lull and neutralize them. He may direct emotion-terminating stimuli at the target—as the Germans did very skillfully sometimes during World War II—in order to allay truly justified fears and pave the way for inadequate action. And friendly psywar frequently attempts to combat fear in its target audience.

An emotional attitude is a strongly held position. Emotion strengthens the attitude; attitudes guide behavior in the discharge of emotional energy. Therefore an emotional attitude is likely to portend vigorous behavior. For psywar, one moral of this is to try to elicit emotional attitudes in support of the operator's themes, and to avoid themes likely to conflict with emotional attitudes. One of the most useful pieces of psywar intelligence we can have, therefore, is a reply to the question: Around what attitudes does the target tend to build emotion? In general it is safe to say that emotional attitudes are most likely to be related to and aroused in connection with ego values. Perhaps the strongest

*The typical pattern of panic, as social scientists understand it, is (a) traumatic experience (such as the dropping of an atom bomb, or the discovery that one is surrounded and under attack), which results in (b) fear bordering on shock, for which (c) there seems no outlet. That is, there is no apparent way to escape the thing feared. While the victim (d) looks around helplessly for something to do about his situation, he observes some other individuals (e) running or taking other action which seems relevant to the situation. (f) He follows these leaders. He and the rest of the crowd stampede. The usual pattern of action in this kind of panic situation is aimless running, often into greater danger.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

personality structure with which psywar has to deal is the complex in which self-interest, ego motives, and emotions center. The psywar operator is likely to get maximum response when he can successfully touch this complex.

Attitudes Related to Personality Types

Are there personality types—groups of persons whose attitudes we may know beforehand, that is, persons whose attitudes we may predict, from knowledge of the type they belong to? It is no longer fashionable or technically accurate in psychology to speak of persons as types or to describe people in terms of distinctive typologies. There is, however, a cluster of characteristics different enough from the "normal" to be thought of as constituting types for some psywar purposes, though measuring instruments that enable us to say definitely what individuals belong to them are not available.

One such cluster of characteristics is that which Adorno⁶ and others have written about under the name of the "authoritarian personality." What is meant here is an individual who basically, often very subtly, has a strong reverence for and dependence on some kind of authority outside himself. This person tends to be ethnocentric, that is, to identify strongly with groups in which he holds membership, and to emphasize the in-group vs out-group distinction between his own groups and others. He shows "authoritarian submission" in the form of an inability seriously to criticize or rebel against his own in-group figures and symbols. He has a highly moralized and idealized conception of authority representatives and a submissive relation to them. He is unable to look objectively at himself or others; indeed, he regards the attempt to look into deeper motives or conflicts as "prying." He likewise tends toward "projectivity," as shown in a tendency to imagine strange and sinister forces at work in the outer world. These imaginings, of course, are really projections of his own deep-lying aggressive and sexual strivings.

All this adds up to a picture of an insecure person with a closed mind, suspicious of the outer world, maintaining and often at the same time resenting a close dependence on authority figures and in-groups. To such persons the Jew, for example, may seem a symbol of strange, unknown, possibly sinister things, a force to be combated by rallying behind established symbols and sources of authority and strong in-group allegiances. Anti-Semitism, as a matter of fact, is one of the most common mani-

ORO-T-214

93

RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATION

festations of the authoritarian personality.

We have talked about the authoritarian personality because it is one of the few such clusterings that have been carefully studied, and because we have experienced a good deal of it in recent years. For example, Nazism was undoubtedly made possible by the high incidence of authoritarian personalities in Germany. We see such personalities at work in anti-Semitic groups in this country. And wherever they appear in large numbers we have a group that we know to be susceptible to psywar of the kind that plays on insecurity and releases the terribly disruptive forces of race or class prejudice.

Attitudes Related to Sentiments and National Culture

Looked at from one point of view, a group is a complex of leadership and followership roles. Those who perform the leadership roles direct the group activities that are valuable to the members, and because they do this come to have value for the members, who accordingly develop favorable attitudes toward them. In organizations that have been established for a long time, such as local and national government systems, companies, and religious institutions, roles themselves become valued: The Presidency, the Chairmanship of the Board, the Papacy, the Governorship. The continued existence and effective functioning of leadership roles are, in any case, matters of real concern for the group members, who rightly see them as indispensable to continuance of the group as a social structure. This explains why Hitler's position in Germany was virtually invulnerable to psywar until the very last, and why this country deliberately refrained from attacking the Japanese Emperor. Psywar against either of these leaders would have aroused strong defensive attitudes.

Along with leaders and leadership roles, the group's symbols come to have great importance to members. The American Eagle, the Stars and Stripes, fraternity pins, crucifixes, etc., become objects of great value, with which people identify strongly and which they will defend with strong attitudes and, on occasion, with strong actions. Both the politician and the propagandist therefore need to understand symbols—how they "work" and how they may be exploited for purposes of influencing behavior.

Finally, we must mention traditions, which without necessarily being directly associated with the formal aspects of the group's activity, often acquire symbolic value. Freshman hazing as a part of fraternity rituals, rugged individualism, Yankee in-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

genuity, southern courtesy, western friendliness, and home cooking are all regarded by some people as important values associated with institutions or group structures that they are determined to preserve. These also must therefore be defended attitudinally, and many a propagandist, inadequately informed about his target, has earned hostility for his whole program by unwittingly disparaging a tradition. Many another propagandist has made friends and gained acceptance by recognizing his target's traditions and conducting his propaganda with due regard for them.

Role Attitudes

We have already talked about role attitudes and noted that when a person has functioned in a particular role for some time, and derived satisfactions from doing so, he takes on attitudes and behaviors appropriate to that role. Storekeepers acquire attitudes that fit in with their storekeeping roles. Professors are widely supposed to act like professors outside as well as inside the academic role structure. Admirals are often identifiable in mufti because they continue to act and talk as if they were on the bridge of a ship.

We have also pointed out how attitudes grow up in defense and support of roles. Children develop attitudes of respect for their larger and stronger elders. Undertakers oppose burial at sea. The well-to-do oppose sliding income-tax scales. Role attitudes also serve as a device for communication with other members of one's group; expressing them often brings members of a group closer together and makes them feel at home with one another. When three NAM (National Association of Manufacturers) members meet in a club car, the fact that each hears the others expressing his own attitudes toward John L. Lewis assures them they are among friends and sharers of common norms. When a fourth traveler joins the conversation and questions the virtue of the NAM, expressing a critical or sceptical attitude, he is suspect, and efforts will be exerted to cause him to conform or remove himself, and his contaminating influence, from the group. There are numerous rituals that are wordless expressions of attitude, and participating in them gives people mutual assurance that they are members of the group, and among friends. This function of attitudes illustrates that attitudes are both self-preservative (helping one to maintain his role in the group) and group-preservative (contributing to the solidarity of the group and thus strengthening it against external forces).

ORO-T-214

95

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONSelf-other Attitudes

It is but a short step from the notion of role attitude to that of self-other attitudes. Although the notion of role attitude refers mainly to the role a man takes in a definite and recurring group situation such as his job, his play group, his family, or his lodge, self-other attitudes refer to the characteristic way in which people relate themselves to others in nonorganized, noninstitutionalized, non-bound-by-rules interactions. The storekeeper is not bound by rules to do any particular thing at, for example, a bullfight, except pay his admission and remain seated most of the time. He can read, study the technique of the picadores, count the number of trombones in the band, or go home, as the spirit moves him. But his personality characteristics, acquired (as we know) through his roles and his role attitudes, will nevertheless influence his way of responding to the shout of "down in front," the bid of the beer vendor, and the sound and smell of the person next to him. He has characteristic ways of relating himself to others, that is, particular attitudes toward what they are doing that influence his reactions to them. These are self-other attitudes. Since they tend to be superseded in formal group structures by specific role attitudes, they are most apparent in informal situations.

The psywar operator needs to understand the function of self-other attitudes because in unorganized situations it is these attitudes, not the role attitudes, that organize and direct behavior. Thus, when enemy troops are in confusion, self-other attitudes will deeply influence their reaction to the estimate of the situation put forward by America's psywar group. In a militarily healthy situation the soldier's role attitudes will probably maintain his discipline. But if the situation deteriorates, if, for example, the soldier is isolated or in headlong retreat, then the self-other attitudes are likely to take over.

Summary

The material in this section will help the psywar operator to map out his battleground and points to some of the target intelligence he needs for his battle map. Where is he likely to find the "strong structures" of attitude in his target? What kinds of attitude in the target are likely to be emotionally involved? What is the nature of the role attitudes the target holds? What are the symbols, the leaders, the traditions around which strong

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

positive attitudes have grown? Are there any areas in which the target's biological drives have been notably unsatisfied so that strong attitudes and disruptive action might be evoked by playing on the resulting tensions? In what fields of information is the situation vague and unstructured for the target so that psywar can take advantage of the strong attitudes related to the need for understanding? The psywar man needs to know things like this if he is to operate with eyes open.

Given this basic intelligence, he will be in position to make some predictions as to what kind of acceptance (or what degree of resistance) he will meet if he sends a given message or combination of messages. He knows, for example, that, when the chips are really down, biogenic drives are usually going to take precedence over sociogenic motives and attitudes, so that a hungry target is probably a poor target for conversion propaganda. He knows there is a strong cluster of attitudes around the deepest aspects of personality, that many of these are likely to be ego-involved, and many emotionally involved, and that, day in and day out, this is probably the strongest attitude cluster he will find in any target. He will try to enlist these strong attitudes on his side, or at least he will try not to arouse them in opposition to what he has to say. This does not mean, of course, that psywar should never attack strong positions. On some occasions it may be more important to do so than to undertake something easier but less promising for the long pull. But when a psywar operation does attack a strong position, it should do so in full awareness of the resistance it is likely to meet. The psywar man keeps himself reminded, for instance, that attitudes arising from the need for group belongingness are often aroused to great strength when the group is threatened or attacked. He knows that favorable attitudes grow up around national and group symbols, traditions, and leaders and that attack on these symbols will evoke defensive attitudes, as invoking their sanction will evoke positive attitudes. He knows that role attitudes are widespread, influential, and hard to change from outside the target culture. He knows that members of his target audience have a strong need for understanding and organizing experience. If he can step into an unstructured situation with a message that provides them informational structuring, they are likely to respond favorably.

This is the nature of the battleground. The next section deals with the nature of the battle itself, that is, with some of the ways attitudes may be changed.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

PROCESS OF CHANGING ATTITUDES

The goal is to change attitudes of members of the target audience. More precisely the goal is to be able to control, speed up or arrest, direct, and redirect changes in their attitudes, including the intensification of present attitudes or maintaining them unchanged in circumstances in which, if left to themselves, they would change. Psywar often defends an attitude (such as loyalty or international friendship) from change, or tries to keep a target feeling about something (such as disliking a common enemy) just as it has hitherto. The goal of the entire process as we have described it so far, that is, attracting attention, getting the meaning across, and understanding the nature of target attitudes and their clustering, is to be able to control attitude change and, through it, behavior.

Before the processes and mechanisms that enter directly into changes in attitudes are discussed, it is necessary to repeat a warning, implicit throughout the preceding pages, that must not be forgotten by any reader who intends to apply this material to the practice of psywar. We said early in this book that research in this entire field is not very far advanced. About psywar itself there has been up to now relatively little research, so that most of the principles stated in these pages have not been developed in or for psywar situations. The purpose of this book, given the present state of research, has to be to gather together the most relevant evidence and theory from social psychology and the other social science disciplines and to attempt to say how this evidence and theory—themselves not very far advanced—apply to psywar.

You should not, then, think of yourself as studying the science of psywar. Psywar is a long way from being a science. Rather, this book offers a social science background for the practice of psywar. The applications to psywar suggested in these pages are for the most part projections and extrapolations from existing evidence intended for purposes other than those of psywar. This evidence will be useful to you. It will let you proceed with more confidence and a better sense of direction. But the application of this evidence to the practice of psywar is not like applying a scientific formula to physical quantities. The application is partly science and partly (in very large part) art.

There has been considerable study of attitude change in various fields and from various points of view. You will find that much of it has a direct and evident application to psywar.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONPrognosis of Difficulty of Attitude Change

The physician is accustomed to give or use a prognosis: he predicts, on the basis of existing evidence, the likely course of an illness. We have been indicating that some attitudes are more strongly defended, and therefore probably harder to change, than others. Now let us gather some of the available material together and restate it in terms of predicting the difficulty of changing different kinds of attitudes.

The more firmly an attitude is anchored in group membership, the more difficult it is to change.

In saying "anchored in group membership," we refer back to our earlier statement that attitudes and group roles tend to support one another. For example, it might be expected that the regular Army man's attitude toward authority and discipline might be more firmly anchored than that of the young draftee. The regular's attitude has grown up out of long experience. He has learned his role thoroughly. The saluting, the obedience, the alertness have become second nature to him, because he has found that they simplify his problems. The group rewards such behavior. His role experience supports the attitude and the attitude supports the role. The new draftee is in the same situation but does not yet fully realize it; he hasn't learned the role so thoroughly, nor have the appropriate attitudes grown so strong.

Studies of religious attitudes have indicated that Roman Catholics, more than members of other churches, tend to hold strongly anchored attitudes toward religion (Katz⁷). It is believed that this is because Catholics are strongly indoctrinated in their church's beliefs and practices, and because the church normally constitutes a relatively large proportion of their routine of living. They spend a considerable amount of time with other members of their faith, who in general hold the same attitudes and have a common concept of role. The attitude therefore supports the group, and the group supports the attitude, by rewarding the individual for playing the role related to the attitude.

Attitudes toward leaders tend to be strongly held in proportion to the degree such attitudes enter into the group activities of the individual. In Nazi Germany, for example, according to Shils and Janowitz⁸, attitudes toward Hitler would have been extremely hard to change: Hitler was a value-laden symbol integrated into the daily routines of a large part of the population. Lesser figures in the national structure were much more vulnerable. They may, from some points of view, have been no less important than

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Hitler to the national effort, but they were much more remote than he from the daily lives of the people. The people belonged to the Hitler Youth, listened for the voice of Hitler on the radio, kept the picture of Hitler on their walls, and were rewarded for doing as Hitler said they should and for following the example of Hitler and for cheering Hitler. Hitler personified and unified all their attitudes toward authority and leadership, which, it is sometimes said, have always been strong and idealized among the Germans. Hitler, therefore, could "do no wrong." If something went wrong, it was the fault of lesser functionaries, of bad staff work, or of disloyalty to Hitler. Any direct attack on Hitler could thus be counted on to rouse strong defensive attitudes.

It seems probable that similar strong attitudes gathered in the Soviet Union around Stalin. No matter how he looked from the outside, to many Russians he must have been a symbol of the rewards they got for playing the role of good Communists, loyal Russians. Stalin was equated with the rewards they got out of their role-playing. If there were unequal distribution of food and supplies, bad orders, unmet quotas, mistakes, then lesser officials, not Stalin, were responsible. It would be far easier for psywar to induce an unfavorable attitude toward lesser Communists than toward such a leader as Stalin.

This does not, as has been said earlier, mean that psywar should necessarily follow the easiest path. Sometimes more can be accomplished by frontal assault than by attacking on a flank or bypassing. There are, of course, situations where it would become the task of psywar to attack strongly held attitudes frontally for reasons other than the intention to change them. Psywar might, for example, have the mission of unifying the target, or of stirring up controversy within it. We cannot remind ourselves too often that there is an unlimited variety of potential psywar missions. Sometimes it is worth the effort to attack the strongest attitude in the hope of changing it. But any decision to do this must be made in the light of a clear prognosis of what it may cost in time and effort.

As a further example, note that a member of the armed forces, in a foreign country, is per se a psychological as well as a shooting warrior. For example, the behavior of American troops in Japan was closely observed and in general favorably received; it apparently helped in minimizing the general problems of the occupation. Now how should such a soldier or sailor proceed in his part-time psywar job? One principle of conduct is suggested by what we have been saying, that is, he should not openly

SECURITY **RESTRICTED** INFORMATION

or strongly oppose the important group-based attitudes of the people about him unless he knows it to be the policy of his country to do that. For example, he should be wary of attacking or belittling their religious practices or their attitudes toward the family or the customs and practices they follow in everyday contacts with one another, unless his government has indeed bargained for the unavoidable consequences. All these are likely to be strongly defended, because the attitudes are constantly reinforced by successful role experience, and vice versa.

The more isolated an attitude is from a person's other systems of belief and values, the easier it is to change.

This is seen most clearly in the case of newly acquired attitudes, which the person has not had time or occasion to integrate with the rest of his psychological make-up. Everyone has some traffic in temporary attitudes—toward facts, art objects, news items, or minor political figures of temporary prominence. These attitudes are usually subject to change through discussion or through the manipulation of prestige symbols. People are willing to "talk them over" or are willing, with respect to them, to follow the lead of an authority, for example, that of a drama or music critic. Since these attitudes are of minor importance in the individual's "psychic economy," he can afford to change them according to shifting conditions.

But let us suppose that a man who holds strong religious attitudes comes upon a new book, written by a member of his church, which advances and illustrates the doctrines of that church. That book is likely to be integrated rapidly with his other belief systems, and his favorite attitude toward it is likely to resist attack by some such prestige figure as a literary critic. This will be especially true if the church group rewards a favorable attitude toward the book, for here the force of group anchoring will come into play.

Attitudes may be more transient at some times than at others. For example, transient attitudes are likely to be encountered when a population is undergoing radical change, as during a revolution, an economic crisis, or a military debacle. In times like those, old value systems, beliefs, and allegiances are being questioned. People look around for new attitudes, new ways of anchoring and securing themselves. Things are moving so swiftly that people haven't time to integrate new ideas with old, and in such periods the old ones are less dominant than usual anyway. In the French revolution, for example, attitudes shifted rapidly from support of one leader to another. In the period of Communist occupation

SECURITY **RESTRICTED** INFORMATION

of Seoul, people were bewildered by events, lacked confidence in their old attitudes, and were more receptive than they would have been in normal times to the new attitudes which the Communists suggested to them. In such situations of flux the psywar operator has his best opportunity to propose and support new leaders, new programs, new values, and new patterns of action.

The more clearly an attitude is differentiated and organized, the less likely it is to be affected by prestige suggestions or other such devices. It will yield, if at all, only to rational argument or to piecemeal attack on the beliefs that support it.

An example is furnished by an experiment by Lewis⁹ which attempted to modify attitudes toward political slogans by attributing them to prestigious public figures. Although the less-informed subjects, holding less well-differentiated and organized attitudes, were somewhat influenced, the better-informed subjects were not. In fact, they would often question the validity of attributing the quotation to the man who was credited with it. Faced, for example, with a statement attributing "America for Americans" to FDR, some answered "But Roosevelt just wouldn't say that!"

The practical problem of influencing such well-organized attitudes is great and may not be solvable at all except when psywar is being undertaken in a period of major social change. So well rationalized are they that, even if some of the supporting beliefs and attitudes are discredited to some extent, the remaining supports are likely to be strengthened. For example, a German intellectual may be made to agree that the notion of the biological superiority of "Aryans" is nonsense, but if he has a strong need to identify with and submit to authority he will probably cling to the idea that German culture is, regardless of the cause, superior to others and that therefore the Reich must be revered and served.

Observations recorded by Bettelheim¹⁰ in German concentration camps show that only under severe conditions did the prisoners reject their previous value systems and more or less completely adapt themselves to the new life in the camp. Men who had been prisoners for several years took over the Gestapo's attitudes toward new and unfit prisoners, carried out and enforced arbitrary rules of the Gestapo long after the Gestapo had abandoned them, and often came to believe that beneath their rough exteriors the Gestapo guards were decent fellows. Such a transfiguration of personality, attitudes, and values usually required years of "reeducation." Nothing remotely approaching it can be

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

expected via propaganda alone. So long as the role structures, or substitutes for them, in which personality is formed and expressed remain intact, basic attitudes will remain unchanged. In their study of group stability in the Wehrmacht, Shils and Janowitz^b showed that the troops' loyalty to Hitler, the Reich, and their immediate superiors held up under severe military conditions even when it was felt that the war was as good as lost. Role attitudes of subservience to authorities were so enmeshed in basic personality structure that surrender leaflets and other psywar messages were largely ineffective unless primary group structures were breaking up under force of Allied arms, and threats to life were constant and immediate. There were, to be sure, many surrenders, but they were often rationalized in terms of practical ends that allowed basic attitudes to remain untouched.

The more clearly a person understands what his attitudes are and what they can do for him, the less likely these attitudes are to be changed by suggestion and argument.

The nonsmoker who opposes cigarettes because he knows that they are bad for his health is not going to be moved by the fact that 99 percent of the men who know tobacco best smoke Peaches. Nor does the scholar who holds well-documented attitudes toward cultural determinism care whether the authorities cited in opposition to his view are "eminent." It is probable that businessmen felt that Old-Businessman Bernard Baruch's recommendation for complete price controls represented a lapse of normally good judgment, and they did not support his proposal, preferring policies in accord with their well-thought-out best interests. It is difficult to make a dent in attitudes that are understood by their holders by simply criticizing those attitudes or bringing authorities and other prestige symbols to bear against them.

However, understood attitudes are likely to be open to discussion; and we must note here a practical difference between these and the integrated attitudes discussed above. For example, Hovland and others,¹¹ in their experiments with the effects of orientation films during World War II, found that in the case of better educated subjects a more favorable situation for attitude change was set up when both sides of an argument were presented. In general the person who understands why he holds an attitude tends to be willing to concede that there is something to be said for the other side and that his attitude may not be correct under all possible conditions. It is likely that such understood attitudes are limited to some extent to persons who are relatively well educated and have been exposed to some of the values of self-

SECURITY **RESTRICTED** INFORMATION

criticisms 1. Such people are open to persuasion, to the extent that their attitudes are of this rational kind.

Basic Pattern of Change

In this book a picture of what people are like, what makes them tick, and especially what leads them to hold the attitudes they do has been gradually built up. The human being is an organism, born with biological needs and placed in a social situation. He learns, little by little, to discriminate between the parts of experience that are himself and those that are not himself. As he gradually builds this awareness his basic need comes to be to preserve, enhance, and express himself, the self; that is, the enduring aspects of the personality. Experiences that protect or enhance the self are rewarding, to be sought after. Experiences that threaten the self are classified as threatening, to be avoided. Experiences that give meaning to experience, and thus enable the individual to behave more efficiently in satisfying needs, come increasingly to be sought as the individual matures. As he finds out what experiences are rewarding, he learns to repeat them, learns to discriminate among responses, learns habits. Attitudes of favorableness and unfavorableness become firmer as the habits harden. He develops favorable attitudes toward experience that reduces biological drives and unfavorable attitudes toward experience that hinders drive satisfaction. He develops attitudes to support action leading to reduction of his emotional tensions, to relieve the external conditions that bring about fear or anger, for example. He develops attitudes to guide action through which he can preserve values; for example, if fair play is one of his values, he develops unfavorable attitudes toward cheaters; if free enterprise is one of his values, he develops unfavorable attitudes toward anything socialistic. He builds up attitudes which support behavior allowing him to use resources; if he dances well, he is receptive to attitudes that support dancing in public. He builds up strong attitudes toward parts of his experience that threaten or enhance his ego involvements. And he develops attitudes that support the roles he is trying to play and the group norms he has learned. As he matures, these roles become more important to him, and the group norms become clearer. Under the influence of group sanctions, he represses some of his motives, and these subsequently enter into his behavior only without his being aware of what is happening.

Thus the personality, that is, habits, system of values, char-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

acteristic strivings or needs, and characteristic ways of perceiving relations to others, grows by constant interaction of individual and group. It is impossible to make a sharp separation between the individual factors and the group factors involved in the process. Nevertheless the psywar operator has much to gain from keeping them separate in his mind. Any psywar message clearly has to contend at any given time with psychological factors operative within individual members of the target audience and social factors operative in the target environment. If the target individual is to be persuaded to hold a given attitude, the action to which that attitude predisposes him must square more or less with his personality factors (habits, values, needs, etc.), his role patterns, and the group norms as he has interiorized them. It is likewise clear that the intended change in his attitudes may be facilitated either by something new in his environment (for example, threat of group disorganization) or by some new physical or psychological factor (for example, hunger or confusion). With all this in mind, we can suggest a kind of master pattern for attitude change, which takes account of the foregoing considerations.

1. If a person's attitudes are to be changed, if he is to be predisposed toward action of such and such a kind, then the action the proposed new attitude implies should fit the psychological pattern operating within him at the time.

For example, a very hungry man is in poor shape to entertain logical argument. A direct attack on an ego-involved attitude will be strongly resisted. On the other hand a suggestion that merely expands or diverts an existing attitude will have easier going. A suggestion that evokes emotional attitudes in its favor will have strong support. A suggestion that meets a need (for example, for clarification in a vague situation) will probably be received with gratitude.

2. If a person's attitudes are to be changed, then the action the proposed new attitude implies should be in support of present group relations or lead to other group relations that are important and meaningful to him.

For example, people normally do not adopt attitudes implying action that would result in their being read out of groups important to them. They do adopt attitudes that support the roles they play in groups or that maintain the groups in which they

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

play roles. This is particularly true in the case of primary groups, such as the family. It is also true in the case of the national group, which represents the supreme effective power, includes all the groups that can be important to most people, and provides practically all the circumstances through which personal values can be expressed, attained, and maintained. Appeals based on nationalistic motives and identifications, especially when a nation is under threat from outside, are likely to be most effective. When the group situation is somewhat vague, an invitation to join a stronger group is often effective; this is a favorite Communist technique, in fact a favorite technique of all revolutionists.

3. If a person's attitudes are to be changed, the most favorable situation exists when the action the proposed new attitude implies is congenial both to the psychological pattern operative within him at the time and to his group relations and aspirations.

When an individual's personality values and the roles he has to take are not harmonious, then we say that he is "maladjusted." (Bringing this about is sometimes a goal of psywar.) On the other hand nothing is more acceptable to a person than an activity that gives expression to his interests, needs, and values and at the same time contributes to the support of his important groups or of his membership and status in them. For example, many Communists who have been studied psychologically appear to have been highly insecure, often rather lonely, individuals. By joining an organization with strong discipline, clear-cut roles, and clear-cut principles and antagonisms, such people win greater personal security and, along with it, the satisfactions of status and action in a group. What happens when propaganda does not fit the pattern of both psychological and group factors is illustrated by the previously mentioned Shils and Janowitz⁵ studies of morale in the German Wehrmacht during World War II. America apparently made some telling hits with propaganda addressed simultaneously to the personal values of German soldiers and their concern for their families. Their anxiety was aroused. But so strong were the role attitudes in the Wehrmacht and the relations in the primary group structure (company size and under) that there were very few surrenders until actual military defeat had broken up the primary groups. Our propaganda, in other words, was unable to break down the immediate social structure for survival and psychological support, and as long as that remained intact our efforts were unsuccessful.

SECURITY **RESTRICTED** INFORMATIONMechanisms of Change

The basic pattern of change is therefore the one we discussed previously under the general topic of learning, that is, responses that are rewarded tend to be learned and retained. This is the most direct way to accomplish a change in attitude, and the simplest way to put it into effect is against the background of a monopoly of communications such as the Communist states try so hard to achieve within their own borders. Indeed, so important is communications monopoly to the Soviet propagandists that during their 1950 occupation of South Korea they confiscated as many radios as possible from South Korean homes to keep them from being tuned to UN stations in Japan, despite the fact that by so doing they gave up the chance to speak to Koreans on Radio Seoul, which they had captured intact and which was the most powerful broadcasting station in East Asia except for Peiping. In other words they gave up the use of radio in return for a communications monopoly, which they exploited with print, film, and face-to-face methods. The advantages of monopoly are obvious. The monopolists can completely control what cues are presented, and, so far as communications themselves control rewards, they can determine completely what responses are to be reinforced. Propagandists from our country are seldom given so favorable a situation in which to operate. For the most part they have to operate under conditions of intense competition. When they direct psywar to Communist states they have to operate against intense and effective opposition. Therefore, although it is easy enough to say that practicing a response (such as expressing an attitude, passing a rumor, opposing an authority) and being rewarded for it is the best way to ensure that the response will become a dependable part of the person's behavior, it is quite another thing for the psywar operator to bring about this situation by means of long-range communication.

So far as the use of communications as a direct instrument for changing attitudes is concerned, then, the psywar operator must try to set up situations in which the responses he wants will be rewarded and thus reinforced. He will therefore try to build his messages around appeals and themes that are related to tensions or needs in the target and suggest responses that (a) are desirable from the point of view of the psywar mission, (b) have some chance of being expressed in the target culture, and (c) will reduce drives or other tensions and therefore be rewarding. We have already talked about areas of tension, but let us summarize briefly here:

Biological Drives. In normal times, these drives are satisfied

ORO-T-214

107

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

by existing social patterns and do not present a fruitful field for psywar, but in case of threat, emergency, and deprivation they may become important sources of reward and reinforcement.

Normal Personality Needs. That is, needs for security, status, understanding, freedom from constraint, clear definition of role, etc., are numerous and common to all men. But they are, of all needs, the ones most likely to be satisfied within the target culture.

Deviant Personality Needs. That is, needs regarded as abnormal or deviant by a society are widely unacceptable, encounter taboos, and are more frustrated. Hence persons with deviant needs are more strongly motivated in nontypical directions than other members of society. Homosexuals are a familiar example, and we are often reminded that because they are good targets for blackmail they are poor security risks. This is not the place to discuss deviant personalities in detail, but let us note that the same needs that make them poor security risks also make them good targets for psywar. Their resentment against the society that refuses to accept them can often be channeled into behavior that fits in with the psywar operator's mission.

Transient Personal Needs. These needs also are common to all men, but usually people are able to reduce them in a socially approved way. However, there are situations in which people are subject to need-producing factors beyond their (and their society's) control. The soldier in the field, the population under bombing or siege will often have unsatisfied needs for food and for relief from pain, discomfort, stress, anxiety, and threat to life and health, which are not the less urgent for being transient. In such situations there is a ready market for psywar operations that direct attention to these needs and point a way to their satisfaction.

Group Needs. This class includes needs such as that for acceptance by others, especially in the primary group. Acceptance by others is perhaps the most important form of reward for changing human behavior. If, then, the psywar operator can find a way to manipulate group pressures, he has a ready-made device for reinforcement of his message. This, of course, is one of the reasons why the Communists gear their mass media into a well-organized system of groups within any country they are trying to propagandize.

But the process of stimulus and response in society does not always follow the relatively simple and unhindered path we have been describing. Sometimes the target culture does not sanction the response that would satisfy the need or reduce the drive on which psywar seeks to play. The role attitude of the individual member of the audience, or his general value system, may inhibit

SECURITY **RESTRICTED** INFORMATION

the desired response. In such a case the path to drive reduction is often indirect. Indirect paths are of great importance to the psywar operator as he seeks, at long distance, to set up the learning system (we call it a "paradigm") in which a desired response to a given cue will be rewarded and hence reinforced and learned. He can, if he understands them, make good use of them.

We are talking now about what Sigmund Freud called "mechanisms." Freud used this term to refer to the techniques the individual employs to protect himself from the recognition that he has motives and desires that he should not have. In recent years the concept has been expanded to include not only the function of protecting the self from itself, so to speak, but of protecting the self from the outer world. Thus rationalizing the purchase of a new car in terms of "long-run economy" may protect a man from recognizing that he wants to look more important than the person next door, and regression serves to remove the person from the responsibilities thrust on him by society, by taking him back to the comfortable and safe dependency of childhood. Both are common and effective means of winning and maintaining comparative freedom from anxiety. In this section we shall describe and illustrate several of these modes of reacting to problem situations, all of them familiar to contemporary psychological research. By means of communications and carefully planned events, the skilled psychological warrior can put all of them, at one time or another, to work on his behalf.

First, however, let us clear up one possible question: Do these "mechanisms" refer only to abnormal behavior? They do not. Though they are commonly thought of as clinical symptoms, they are also very common features of normal life in society. It might be noted, too, that social living is what makes these mechanisms possible, and also what makes them necessary. The rules of social living impose numerous limitations on what people may do and what they may express as reasons for doing them. Since one is not supposed to express dislikes for rivals publicly, it is only natural to rationalize a bit of unfair business dealing in terms of the "process of competition" or "if I hadn't done it to him he would have done it to me." The frustrated housewife can get vicarious status by identifying with certain kinds of heroines of soap operas. Mechanisms like these are ways of avoiding frustrating realities. They really are needed for the smooth functioning of society; if they did not exist, if people had always to seek direct satisfaction of needs and immediate removal of frustration sources, then certainly violence would be much more

ORO-T-214

109

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

common than it is now, and our social structures would be very shaky indeed.

Let us now look at some of these mechanisms and at the ways they may be used in psywar.

Displacement. Underlying these mechanisms is a general assumption that the individual whose needs are frustrated commonly strikes out at, that is, aggresses against, whatever he perceives as the cause of his frustration (Dollard, Doob, et al.¹²). This is a common pattern and may be made use of by psywar operators to direct aggression against governments that control and tax, officers who lead troops into necessary danger or hardship, etc. But the individual's society does not let him express aggression against the real source of his frustration as he sees it. Children are prevented from directly attacking their parents. Soldiers are prevented from showing aggression directly against their superior officers. In many countries of the world, men are not even permitted to criticize the government. The punishments are too great to make that kind of aggression worth while; the individual therefore learns to control and repress it. But very often he turns his aggression toward some other person, or object, or group, and when he does he is said to have displaced his aggression.

The individual is usually not aware that he is displacing his aggression. Either (a) he is aware of the frustration and attendant feelings of hostility but not aware of the fact of displacement, or (b) he is aware of the fact of interference but is not aware either of the feelings of hostility or of the fact of displacement. The first form is the garden variety of displacement, as when a man home from a tough day with the boss blows his top when one of the children irks him. The second form occurs in people with more severe training in the inhibition of aggression; it is not only overt acts that are inhibited but the verbalizations usually attendant on them as well. The process of repression works to prevent us from recognizing within us the tabooed aggressive thoughts. It is this second kind of displacement that, we are told, operates in habitual fire setters, consistent sadists, and the sterner advocates of "spare the rod and spoil the child." It is also likely to be operating in such strictly reared people as the Germans and Japanese, who are taught to suppress aggressive feelings against fathers and other authorities and to substitute for them verbalizations of respect. The pent-up floods of aggression in peoples like these can easily be directed against out-groups, especially when aggressive action against them is given official sanction. If all this is correct, Nazi anti-Semitism and some Japanese excesses of

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

cruelty during World War II are not too difficult to understand.

Aggression is often displaced toward a substitute, that is, a "scapegoat." This term originated with the ancient Hebrews, who used to send a goat into the wilderness to carry away sins that were causing them a. lings of guilt. Ironically the modern Hebrews have perhaps been used as scapegoats more often than any other racial group. Leonard Doob¹³ points out that, during World War II, Goebbels seemed to launch an attack upon the Jews whenever the Germans had suffered, or were about to suffer, a military reverse or a cut in food rations. He used these unfortunate people as scapegoats on whom the bitterness and disappointment of Goebbel's mass audience could be displaced. He chose for the purpose, be it noted, a single defenseless minority; this is the usual pattern of scapegoat tactics.

Under just what conditions a given person will be seen as a fit substitute is a question that needs further experimental researching. However, we have one essay in theoretical analysis of the problem (Miller¹⁴) and some empirical evidence (Brown,¹⁵ Miller¹⁴) that the scapegoat must bear some resemblance to the real source of the frustration and be of such character as not to elicit anxiety and inhibitions strong enough to protect it from the would-be aggressor. Also the scapegoat must, as already noted, not be able to fight back. By way of hypothetical illustration, suppose a sergeant is dressed down by his company commander. The known consequences of aggression toward an officer inhibit any aggressive response by the sergeant. However, he can be cruel or rude to enlisted men without much risk, and enlisted men and their behaviors are markedly similar to the officer and his behavior, which meets the requirement of defenselessness and similarity noted previously. Hence the next time an unlucky private gets in the way of the sergeant he receives not only any rough treatment he may deserve but also the aggression stored up against the officer.

What can the psywar operator make of this aspect of human behavior? In general his aim should be to emphasize the frustrations and to suggest outlets for aggressive attitudes and actions that will reduce them. Care must be taken, however, to make sure that the objects to be used as scapegoats actually are likely scapegoats and not objects loaded with symbols and cues evoking deference or other attitudes that would interfere with the displacement process. For example, the best analysis of what happened in Germany during the last war indicates that it would have been ineffective to try to turn much German aggression

ORO-T-214

111

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

against Hitler. Aggression was plentiful in that highly controlled country, especially when the war was going badly, as Goebbels recognized when he relied so heavily on aggression against the Jews. The best tactics would probably have been to try to turn the aggression against minor party functionaries, or other Nazis not so well known or so well protected as Hitler. In the Communist countries, similarly, it seems impracticable to direct aggression toward Malenkov or any of the top Communist leaders of the satellites. Rather it would be necessary to try to direct it toward some person or group less well known, farther away (in "psychological distance") from the target audience and its realm of experience. Perhaps the Communists of another country, the cultural officers from the central Party, the bureaucracy in the capital, or the unknown Party members who are thought to be growing rich on graft would be better scapegoats.

It should be obvious that in trying to capitalize on frustration and the displacement of resultant aggression the psywar staff needs the best available information on the attitudes and social structure of the enemy society. Without it the attempt to use and exploit these mechanisms will not only fail but will make American psywar look foolish.

Rationalization. Rationalization serves all other mechanisms by providing the individual with an acceptable reason for an attitude or action. In most western cultures a premium has been placed on "being rational" or having a reason for doing something; it is important to be able to say why you don't like fried grasshoppers or Democrats and not good enough to say that you just don't. The real reasons for a good many of our actions are not acceptable to others or to ourselves; it is not acceptable to vote Republican just because father did; better far to be able to explain that the GOP stands for something you believe in. We say we drink hard liquor not because it relieves tension within us but because of "sociability" or the flavor.

Rationalization is fed by two springs: ignorance and repression. Ignorance-based rationalization is necessitated by the cultural demand that behavior be explainable. Repression-based rationalization is tied up with the individual's need to keep himself from recognizing the (real) reasons for his behavior and attitudes that are socially unacceptable. Why does the anti-Semite not tolerate Jews? Because Jews are greedy and unprincipled, says the anti-Semite, and one must protect himself against them. The true reasons: repressed hostility against authority, strong (inhibited) aggressions, sexual repressions, urgent needs for

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

status and power. If, given the individual's family background and present groupings and associations, these reasons appear socially unacceptable, the individual denies having them not only to others but himself, projects them on some out-group, and uses them as a rationalization for his antagonism against that out-group.

The rationalizing habits of human beings are important to the propagandist, for one reason, because they provide him with great opportunities for influencing attitudes and behavior. If he can manufacture and communicate the rationalization people are looking for, so that they will have good and acceptable reason for behaving as they wish to, the chances are pretty good they will seize on it. He can, moreover, by repeating and giving currency to it, make a rationalization about whose acceptability people are doubtful sound safer than it otherwise would. In general, moreover, the propagandist who understands the role of rationalization in people's behavior will get a better understanding of his target than one who does not; indeed, there is no more valuable psywar intelligence than that which tells us what rationalizations are current in what groups within the target. For rationalization fits in with so many other mechanisms to provide reasons for actions, to justify displacement, for example.

Projection. Another common mechanism is attributing to others motives the individual recognizes as undesirable in himself. The individual does this unconsciously but with spectacular results. One of the classical examples is that of the old maid who tells the police that a man is following her or has made immodest proposals to her. What apparently happens here is that she projects her own repressed sexual impulses onto the unlucky man, who in many such cases is entirely innocent. The hostility she displays toward him merely reflects the shock her own unconscious effort at repression has caused within her. This same pattern repeats itself on the group and even the national level, as may be seen in the Soviet Union, which charges its neighbors with aggressive intentions at a time when the real aggressor is the Soviet Union itself.

Projection ordinarily occurs only where two conditions are present: first having a motive or need that the individual deems socially unacceptable and second being unaware of having it because of having repressed all knowledge of it. This has been demonstrated experimentally by Sears.¹⁶ A prime example in American history is the case of Anthony Comstock, who with the help of other persons of the same ilk pushed through Congress the "Comstock laws" against the mailing of matter referring to

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

sex. Comstock's biographers have shown that as a young man he was very interested in sex and felt great guilt for his pre-occupation with such a topic. Gradually, it would seem, he repressed his thoughts about sex and came to attribute them to others, against whom he then waged a vigorous campaign. The individual who has tabooed sexual impulses, in other words, can effectively combat them by seeing them in others and denouncing or punishing those others. The denunciations and punishments contribute to his self-respect and free him from the anxieties associated with recognizing the drives.

What can the psywar operator do with or about projection? At times it is well worth his while to recognize, encourage, and exploit the tendency to project on the part of members of his target audience. We have already pointed out how Russian propagandists are using this mechanism to make peoples suspect non-Communists of aggressive tendencies. Hitler and Goebbels used the same technique whenever the Nazis invaded a new country. The North Koreans continued to tell their people that the invasion of South Korea in June of 1950 was a defensive move against a South Korean attack. All these instances appear to have involved cold and calculated planning to make use of the mechanism of projection, along with other mechanisms that have been discussed. The victim of such propaganda, be it noted, actually believes the person or group on whom he projects to be guilty of the alleged crime or crimes, even in the teeth of evidence to the contrary. Countless North Koreans are today certain that South Korea invaded North Korea. Many intelligent Germans, in 1938 and 1939, believed that Germany was being encircled with aggressive intent and that enemy armies would soon move to impose their will on the Reich. Out of the total evidence available to them they selected that which fed the powerful mechanism of projection. It may be assumed, similarly, that a very large number of Communists honestly believe that the non-Communist countries are aggressive, that the Communist countries are in danger, and that every extension of Soviet power is a defensive measure. In fact it would be surprising if this point of view were not held even in the Politburo, which set the campaign of projection in motion. Projection brings satisfying relief from anxiety and guilt, and high-level Soviet bureaucrats are not less vulnerable to anxiety and guilt than other human beings.

The psywar operator, then, will be well advised to look for evidences of guilt and anxiety in the target culture and to ask how they can be mobilized on behalf of his mission. What are the

SECURITY **RESTRICTED** INFORMATION

taboos, and what motives do they refer to? What does his intelligence tell him about evidence of past or present disloyalties, graft or malfeasance, inefficiencies or failures, homosexual deviations, etc.? What strong drives have apparently been repressed because their expression is not, or is thought not to be, for the good of the State? If the psywar operator can find evidences of guilt, he can be pretty sure that people in the target can be brought to attribute them and the actions responsible for them to others. Nazi propaganda projected numerous socially undesirable motives onto the Jews. The Communists project all manner of criminal impulses onto the capitalists, "Wall Street," "feudal" landowners, etc. In the light of recent disclosures about the Russian biological warfare experiment station in North Korea as long ago as 1950, current Communist charges that the United Nations is using biological warfare are a further clear example both of projection and of playing upon projective impulses in propaganda.

There is yet another psywar use of projection, which can be used apart from repression or aggressive intent. Every propagandist at some time or other plays upon projective impulses to bring individuals into a group or a movement. The problem is to make the individual ascribe his own feelings to the group, and say to himself: "Why, these people are like me!" or "After all, we all dislike the same things!" or "We're all human beings!" or "We're all rational men," for these are the familiar responses when projection is skillfully used in this way. This is what the propagandist is doing when, for example, he uses the "plain-folks" technique. He tries, in part by echoing the projections of the target individual, to persuade him that the operator's side are plain folks, just like the target individual himself. The target individual then feels safe in joining the group, climbing on the bandwagon.

Identification. Identification is projection in reverse; instead of convincing himself that "This person is like me," the propagandized individual ends up saying "I am like him." This is a very common and powerful mechanism. It is one of the things that makes group life possible, and it helps countless lonely people to overcome some of their loneliness.

The parent identifies with the child (and suffers when the child does). The child identifies with the parent (and shares some of the parent's small triumphs and problems). The lonely woman identifies with the movie star she reads about or with the soap opera heroine; she reads her own problems into those of the star and is thus able to share vicariously in the star's sorrows and joys and travels into strange environments. The boy iden-

ORO-T-214

115

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

tifies with the great athletic hero. A whole nation identified with Lindbergh in the twenties, and certainly a great many young women must have identified in the thirties with the woman for whom the King of England gave up his throne. Lovers identify with each other. Soldiers in a small group identify with each other and are more willing to share privations because the others are. In every society, people identify with the leader, read their worries and problems into him, and are therefore the more ready to follow his decisions.

Leadership is, of course, the connection in which psywar can best exploit people's tendency to identify with others. There is some evidence that a group leader often comes to serve as a kind of substitute for parent identification. As several investigators have pointed out, it is more than a coincidence that modern totalitarian leaders use terms like "my children" and "my son," or that the father idea recurs throughout the vocabulary of religion. Certainly a great deal was done in the case of Hitler, and was also done in the case of Stalin, to build a father atmosphere around the leader.

The psywar operator can try to undermine this kind of identification with a leader. This is an extremely difficult operation when undertaken from a distance. It is easier from close at hand. You will probably remember the rumors circulated about Franklin D. Roosevelt, which, whether they were that or not, looked like deliberate efforts to break down identification with the leader of the Allies in World War II. Rumors are one of the most effective tools for this purpose. Against Hitler the rumor was circulated that he was crazy. Against Eisenhower the rumor has been circulated in this country, on the basis of a joking entry in the West Point annual, that he is a Jew.

But it is easier to build identification than to break it down. In the armed services, in civilian organizations, and in neutral countries, leaders can be built up by psywar techniques. Their strength, their humaneness, their warmth, their glamor can be brought home to the target audience, which will then identify with them and be more willing as a result to put their destiny in the leaders' hands. Identification can also be used to distract individuals from real problems toward fantasy and thus to undermine their capacity to cope with real problems. And the intensity of emotions can often be increased by identification; for example, by making the sufferings of the home folks very real to Chinese soldiers in Korea, we should theoretically be able to make them feel more anger toward the persons responsible for those sufferings.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Regression. The moving backward implied in the term "regression" is, psychologically, a reversion to a mode of meeting problems that has been useful in similar circumstances in the past. When the individual's present attitudes and habits fail to achieve satisfaction for a drive, then his attitudes and habits of an earlier period in his life, usually less efficient ones, may be brought into play. This has been experimentally demonstrated in laboratory experiments with various animal forms and with children (Barker, Dembo, and Lewin ¹⁷). Although the most striking examples of regression are to be found in the schizophrenia wards of mental hospitals, this mechanism, like the others, is a normal part of everyday life. In interpersonal relations, outbursts of profanity and violence are regressions toward earlier, more childish, less effective ways of reacting to frustration. In broader social contexts, regressions are evident in the juvenile antics of American conventioners in solemn conclave gathered, in sects that emphasize God as a stern and punitive father figure, and in fantasies about the "good old days."

For psywar, the most important thing to remember in this connection is that regression is most likely to occur, and easiest to bring about, in a context of anxiety, frustration, or shock. For example, men under fire, when highly skilled reactions they have learned in training begin to lose their effectiveness, begin to react less efficiently and in a more childlike manner. Under great stress many a man will turn to mechanical activities and try not to think of his troubles. Psywar can use this mechanism by enhancing the apparent difficulty of the obstacles confronting the enemy, thus making it easier for him to escape from anxiety back into regressive behavior and so to resist less effectively. And by playing down obstacles it can help to prevent regressive behavior on the part of allies and neutrals.

Withdrawal. Psychologically, the term "withdrawal" is used most often to refer to people's tendency to avoid problems and frustrations by retreating from reality into a fantasy state. Daydreaming is a common reaction to problems, and it can occupy such a large proportion of an individual's time that he becomes unable to maintain himself in a society which demands certain overt behaviors as methods of getting along. Daydreams are wish fulfillments, and they consume time; they are also habit forming, since they do give release from tension. The combat psywar operator can assist in the fostering of daydreams by providing news of home couched in nostalgic terms (the Japanese used the song "White Christmas" to this end in 1942); distributing attractive recipes and menus to hungry troops, pictures of warm

SECURITY **RESTRICTED** INFORMATION

fires to cold troops, or of cool drinks to hot troops; and in general by suggesting unattainable goals relevant to the needs of frustrated, deprived people. It is not to be expected, of course, that all the recipients of messages of this sort will spend their days in schizophrenic stupors. What can be expected is the stimulation in some of them of increased "goofing off" and fantasy play, together with heightened dissatisfaction over the present state of affairs.

Conversion and Confluence. The layman expects psywar to convert the enemy. Indeed, the most commonly expressed concept of the Voice of America has been that it should be a device to "sell free enterprise" or "convert the Communists to our way of life." Therefore we had better set down some notes on the mechanisms of conversion and confluence.

A very frequent life situation is one in which strong motives are in conflict. We say we are "torn between desires" or "between love and duty" or "between what we want to do and what we ought to do." Such conflicts may be very strong. Anxiety and frustration then develop. We look for a way out.

The case of Anthony Comstock may again be used as an example. Comstock lived a good many years in a state of strong conflict between his sexual needs and interests on one hand and the teachings of his parents on the other. The result of the conflict was a drifting from one unsatisfactory vocation to another. After some years of concern over his past and current temptations, he came to see the literature of the world as conspiring to make an immoral man of him and other young people. It occurred to him that if this source of stimulation could be removed he would be freed from his conflicts. He found such strong virtuous feeling in his initial attitudes and reactions against suggestive literature that he quickly became wildly enthusiastic over the prosecution of this new cause.

What happened to Comstock represents confluence perhaps better than conversion. That is, he found a path whereby conflicting motivations could be expressed and thereby relieved his anxiety. The Nazis deliberately provided such outlets by allowing sadistic exhibitionistic drives to be expressed under conditions of social approval. In any working society there has to be a certain amount of rationalization and displacement so that escapes can be found from conflicts of motive, or means discovered for reconciling them.

By "conversion" we mean something more than providing an outlet to relieve conflicting tensions. Comstock's story illustrates some of the features of conversion: (a) a strong per-

SECURITY **RESTRICTED** INFORMATION

sonal conflict, (b) realization of a pattern of action that will relieve the conflict, (c) intense activity in that direction, and (d) great enthusiasm over the new pattern. This is much like what happened to St. Paul on the Damascus road, and Paul's story, perhaps better than Comstock's, illustrates the essence of conversion. Every true convert "sees a vision." He experiences the blinding light. The idea he has been looking for suddenly comes to him; all at once his world falls into order, and he feels an overpowering motivation ("a call") to the new way of life. Many converts have testified to the feeling of peace (relief from anxiety and conflict) that came to them with the call, and to the new drive (a confluence of previously conflicting motives) that impelled them to convert others, to work for the new order, repudiate their old allegiances, and stand against the new order's enemies.

Conversion, then, is not simply an outlet, temporary or otherwise. It is not a gradual shift of attitude from opposition to favor. It is not a slow strengthening of belief brought about by advertisements or propaganda. It is a sudden and complete shift of position, a rejection of past belief. It occurs as an all-or-none phenomenon and involves a reorientation of all or a large part of one's personality and behavior.

Stories of conversion in a modern political context are not uncommon. Kravchenko¹⁴ describes how he was torn by a conflict between comparative material comfort and high status, on the one hand, and opposition to Soviet inefficiency, cruelty, and cynicism, on the other. He resolved this conflict not merely by fleeing from the Soviet Union but by becoming a violent opponent of the Soviet regime. Louis Budenz is another example, now violently opposing what he formerly espoused. On the other side we have the record of General von Paulus and others of the Free Germany Committee.

Frankly we don't know much about how to achieve conversion by mass communications at long distance. Because of our experience with religious conversions, we know a great deal more about conversion face to face. Here the situation for success falls into a fairly common pattern: (a) the intense personal conflict, (b) a clear and simple pattern for resolving the conflict, (c) symbols highly clothed with emotion, (d) (usually) a leader with whom one can identify, and (e) a promise of group reinforcement. This seems to be the pattern of religious conversion and apparently also of political conversion. For example, some accounts of conversion to Communism have stressed (a) the severe malad-

SECURITY **RESTRICTED** INFORMATION

justment and insecurity, (b) the apparent clarity of the Marxist doctrine, (c) the emotional quality of the symbols of "equality" and "the working classes" and "workers of the world," (d) the influence of a highly trained agitator, and (e) the reward of belonging to a group of similarly motivated individuals. The last is very important. The Communists seldom rely on mass communications alone to accomplish any major result. In a country where they have major goals they have a major organization. In a country where they seek converts they have a well-organized group into which the convert is invited. This does not mean that we understand fully even the mechanisms of face-to-face conversion; certainly the psywar operator should study carefully the results of psychological research on political conversions as this research becomes available during the next few years. But it does mean that we can at least make some tentative suggestions to psywar planners who may some day have a mission that calls for attempts at converting Communists and Communist sympathizers.

In the first place it is evident that a great deal of conflict and tension exists among highly placed Communists. Attention has been called to the insecurity of Soviet officials over being discredited if and when the Party Line shifts and leaves them in the position of having advocated something "wrong." Certainly one thing psywar can do is to try to heighten some of these conflicts, with the hope of setting up the conditions for conversion. A second thing we can do is to present a clear alternative; this should obviously be appropriate to the target culture rather than to our culture. For example, as Charles Malik of Lebanon, a good friend of the West, warns us, we must not expect the American system (based on the needs of an industrial middle-class democracy founded on centuries of tradition) to be adopted "in countries where there is no middle class and no industry, where such tradition is wholly lacking." In the third place we can at the proper time introduce symbols with a strong emotional appeal, though these too must be appropriate to the target culture. "Free enterprise" may mean less than "land reform" to the people we are trying to convert. Finally we can do everything we can to give our prospective and actual converts the advantage of group reinforcement. Converts need this. They need, in their strange new pattern, to feel that they belong. They need to see other people doing what they are doing. They need people to identify with and project onto. They need work assignments, which usually require group organization. It is obvious, therefore, that

SECURITY **RESTRICTED** INFORMATION

the conditions for conversion are going to be much more favorable if we have an underground organization.

Summary

Early in this section, we stated what we called a basic pattern for attitude change, which was briefly this:

1. If a person's attitudes are to be changed, if he is to be pre-disposed toward action of a desired kind, then the action should fit the psychological pattern operating within him at the time.

2. If a person's attitudes are to be changed, then the action to which the attitude leads should be in support of present group relations or lead to other group relations important and meaningful to the person.

3. If a person's attitudes are to be changed, the most favorable situation exists when the action the attitude implies is congenial both to the psychological pattern operating within him at the time and to the person's group relations and aspirations.

Most of the rest of the chapter has been in the nature of applications of these principles. For example, we have discussed predictions as to how difficult or how easy a given attitude might be to change. We said that the more firmly an attitude is anchored in group membership and the closer it is to a person's other belief systems and values, the more difficult it will be to change. We said also that the more clearly an attitude is differentiated and organized, the less likely it is to be affected by prestige suggestions or other such devices, and also that the more clearly a person understands what his attitudes are and what they can do for him, the less likely such attitudes are to be changed by suggestion and argument.

Turning then to the practical problem of the psywar operator, we tried to illustrate some of the processes by which attitude change may be brought about. The basic pattern, of course, is the learning paradigm, in which responses to given cues are rewarded and reinforced by the reduction of biological drives, normal personality needs, deviant personality needs, transient personality needs, or group needs. However, it may not always be possible to elicit the desired response and reward it. Social sanctions, group norms, or personal values may inhibit such a response. In such cases certain mechanisms, or ways of reacting to frustration and allaying anxieties, can be brought into play. Among these mechanisms are:

Displacement—When aggression cannot be expressed against

SECURITY **RESTRICTED** INFORMATION

the person or persons responsible for the frustration that caused it, then the aggression may be directed against a substitute.

Rationalizing—Offering acceptable reasons for actions saves one from recognizing the true (usually not acceptable) causes.

Projection—One's own motives (sometimes those which one does not realize he has) may be attributed to others.

Identification—Another person's motives, qualities, and experiences may be shared vicariously or attributed to oneself. Whereas the projector says "he is like me," the identifier says "I am like him."

Regression—When one cannot meet a problem situation, he is likely to revert to an earlier, probably more childish, way of meeting such a problem.

Withdrawal—Another way of avoiding frustrating problems is to retreat into daydreams and fantasies.

Conversion—Conversion is a sweeping and usually permanent change of attitudes and values, which comes about as a means of resolving long-standing conflicts between strong sets of motives.

These mechanisms are of potential use to psywar. Some of their psywar applications have been discussed in the preceding pages. In general, they provide ways of making use of anxieties and frustrations in the target society and of bringing about attitude changes and resultant actions even when these are directly opposed by the target culture.

ATTITUDE CHANGE AND ACTION IN GROUPS

We have consistently emphasized that personality factors and group factors interact in changing attitudes and motivating action. However, so far we have rather neglected the group problems. This is a good time to try to fill the gap and put together some of the information a psywar operator needs to know about groups, how they work, and what they mean to psywar.

Now it is obvious that most psywar is planned in terms of groups rather than individuals. Only rarely can psywar permit itself the luxury of tailoring a message or a campaign to an individual. The "propaganda man" (who stands for the target in the mind of the psywar planner) usually represents a composite or average or mode of the personalities in a group—or so the planner hopes. The psywar operator looks for needs, motives, or values that seem to characterize a given target group and distinguish it from other groups. Then he designs his message with a careful eye to these distinguishing characteristics.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Once a group has been selected as a target for the psywar planner, two questions are always paramount: (a) what is the degree and kind of like-mindedness in the group? and (b) what machinery has the group for responding to the message?

Concerning like-mindedness, he has two further kinds of question: the obvious one, What needs, motives, repressions, value systems, common interests, or characteristic ways of responding make the group members like-minded? And a less obvious one, What is the range or variation around the typical or representative or model personality pattern? In other words, how nearly like-minded are they? This is an exceedingly important question to put to Psywar Intelligence. Averages in this sort of planning are no more meaningful than the average of one horse and one rabbit, which figures out, let us say, about the size of a pig or an antelope.

If a large percentage of the members of a target group have approximately the same anxieties or needs or problems, then the psywar operator can easily devise messages for the group. But if there is a wide variation, then he either is up against a group on which psywar cannot be used profitably, or he has not yet broken it down far enough and thus is not yet ready to exploit it as a target.

As far as machinery of response is concerned, the planner wants to know how the group operates. How much interaction takes place inside it? How much discussion or implementation is a message likely to get? A message addressed to a mass audience will probably get far less discussion than one addressed to a surrounded battalion or a labor union. And what action is the group in position to take? A message addressed to the common people of North Korea, even if it had convinced many of them that the Communist regime was bad, would still have been up against the fact that they had few channels for action other than those desired by the Communist regime. Their actions were tightly controlled. On the other hand, Captain Zacharias¹⁹ was broadcasting in 1945 to the power elite of Japan, that is, the very people who could do what he wished done, that is, surrender the islands.

Let us look at some different types of groups and how they work.

Types of Group

We know that society consists of and operates through a system of interrelated social groups. These are of many kinds

ORO-T-214

123

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

and size, from two lovers on a park bench to a rioting mob on May Day in Tokyo, from the small primary group (such as the family) to the nation, from a crowd of spectators at a football game to the members of a religious denomination. Perhaps the most important of all groups is the primary group, because this is where most human communication takes place and where the individual learns language and his first roles and his basic concepts of group norms. Another important group is the crowd, a collection of people drawn together by an event. The crowd, properly motivated and directed, has despite its accidental character the capacity for collective action, and we shall have more to say about the crowd in this respect. Another group is the public, which for our purposes we may define as a group confronted by an issue and under some tension to reach an opinion on it. Still another group is the mass, which Blumer²⁰ calls "an anonymous group of anonymous individuals," that is, a large grouping of people distinguished not by contact but by some common place of residence or common interest. There are many other types of groups, but for the purpose of psywar the most useful division is into two general kinds of group: classificatory and functional.

A classificatory group is any number of people having an important feature or characteristic in common but lacking in interpersonal contacts. White-collar workers, day laborers, the audience for the Jack Benny program, Naval officers, engineers, Negroes, deaf mutes are all groups of that kind. This does not mean that no contacts take place between members of such a group but only that interpersonal contacts do not ordinarily take place between them because of their membership in the group. For example, if engineers join a national society, or work on the same job, or band together to organize a new firm, they will have interpersonal contacts, but those contacts come about not because they are engineers, but because they have formed the other kind of group—a functional group.

A functional group is a number of people whose behaviors have some predictable effect on one another. Examples are the New York Yankees, the Jones family, the fellows in the machine shop, the third platoon of Company E, the Senate of the United States, the crew of a B-47, and the Operations Research Office. In the very nature of the case the members of such a group interact with each other. The larger the group, to be sure, the less interaction. For example, the members of the Jones family or a B-47 crew will be in more frequent contact with one another

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

than, let us say, the members of the 1st Marine Division.

Like-mindedness in both kinds of group may be either transitory or relatively permanent. A ship's passengers, marooned on an island, share a common problem but will throw off their commonality as soon as they are rescued. The audience listening to a radio address by a high government official has a high degree of common interest during the speech but will break up into other groups as soon as the speech is over. Likewise a cut in food rations will for the time being fuse a large number of otherwise unlike people into a group with a common source of frustration, but this will pass and other groupings will then replace it. Psywar can use such transitory groups as targets and does use them, but the majority of target groups are more stable than that. They tend to be groups organized around continuing interests and motives.

Here are some examples:

Power-interest groups

(a) **Political**

Classificatory: government employees in China, tax collectors in Korea, chiefs of state of Latin American countries, the "intellectuals" in a target society

Functional: the government of Iran, the Russian Politburo, the Chinese Ministry of Propaganda, the British Foreign Service

(b) **Military**

Classificatory: Russian submariners, soldiers in the CCF, Communist cultural officers all over the world, prisoners of war, military leaders in the Arab states

Functional: the 43d Chinese Regiment, the staff of Kim Il Sung, the Egyptian General Staff, a battalion isolated on Heartbreak Ridge, the 29th MIG-15 Squadron

(c) **Industrial and technological elites**

Classificatory: the managerial class in the Soviet Union, big businessmen in the Near East, owners of industry in India, scientific society presidents throughout the world

Functional: the management of I. G. Farben, the Bankers' Association of Shanghai, the Board of Governors of the Royal Scientific Society

ORO-T-214

125

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION**Economic-interest groups**

Classificatory: Chinese farmers, skilled workers in Russia, Korean railroad workers, remaining private landowners in Communist countries, small businessmen in Malaya

Functional: The Communications Union in North Korea, the Chamber of Commerce in Singapore, employees of the Skoda plant, the Association of Swedish Newspaper Publishers

Common value and ideology groups

Classificatory: regional groupings (Bavarians, Muscovites, Cantonese), religious groups (Christians in China, Buddhists, Mohammedans), ethnic groupings (Jews, Negroes, Irish, yellow race), recreational and avocational groupings (golfers, stamp collectors, people who read Pravda, people who see movies)

Functional: religious groups (the Roman Catholic Church, Congregational Church members in Pyongyang, the Korean Christian University), ethnic subgroups (the Georgian Association of Moscow, the Chinese-American Club of Honolulu), recreational and avocational groups (the Philatelic Society of Germany, members of the Moscow Athletic Club, audience at a public address by Stalin)

Any group, whether classificatory or functional, tends to be organized around its own symbols and to have a consciousness of its identity. Therefore it can be appealed to either via these symbols or in terms of its members' common interest and needs. As already indicated, the members of functional groups will interact a great deal more than members of the classificatory groups. On the other hand the functional groups will be harder to reach with mass communications. For the same reason, a mass-media message directed at such a group will ordinarily spread beyond the bounds of the group.

This raises another question. Most if not all individuals belong to more than one group. That is, the individual may be at one and the same time a North Korean, a Christian, a Roman Catholic of the Pyongyang congregation, a member of the railroad worker's union, and a trombone player. (The first two of the group memberships listed are classificatory, the next two functional, the last classificatory.) Conceivably, propaganda

SECURITY **RESTRICTED** INFORMATION

messages might be addressed to him in each capacity, and perhaps by both sides in the current controversy over Korea. What will then be the effect of his multiple group membership?

From the standpoint of the psywar operator, multiple group membership puts him on his mettle as regards the consistency of his messages; if they are consistent, multiple membership may provide a channel for reinforcing them (the ones the individual receives in his capacity as Roman Catholic backing up the ones he receives as trade unionist); if they are inconsistent, the fact of multiple membership may prove very costly, since the target individual then experiences a conflict between the needs relating to his various memberships. To go back to our example, the North Korean's union is affiliated with the Communist Party, while his church is anti-Communist. The ruling regime's propaganda is pro-Communist, pro-trade union, anti-Catholic. By playing up anti-Catholic themes, it may alienate him; by playing down anti-Catholic themes, it may keep him in the boat. It defends the confiscation of his church property, praises workers who meet their work quota on the railroads; it appeals to the emotional symbols to which he responds as a North Korean patriot, but weaves into its radio programs music that he dislikes in his capacity as trombone player. Psywar operators have to give careful attention to this sort of thing, about which we have now said enough to be able to add that we are using "consistent" in a special sense. Consistent propaganda, on the above showing, is primarily propaganda that makes its bets as to how best to exploit the "lay" of multiple membership within the target, and sticks to them, at least until there are urgent reasons for making new ones. The results, of course, will be no better than the original bets, about which we will say more in a minute. The immediate point is that by switching its bets in this matter a psywar operation may well end up by alienating everyone.

What we are saying here is that a psywar operation cannot hope to produce propaganda that will please everyone, that it has some choices to make as to whom to please and whom to risk offering and alienating, and that these choices have to be made with an eye to the fact of there being numerous groups within the target (Catholics and Protestants, Christians and atheists, Communists and anti-Communists), and the further fact of multiple membership, which means that even those whom your propaganda pleases may be alienated because of what you say to them in some capacity you have overlooked. About all we can say about the latter problem is that each individual decides for himself how,

ORO-T-214

127

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

in reacting to propaganda, he "weights" his various group memberships, that is, what group needs he is going to treat as representing his dominant needs. We can say too that if your propaganda sets up a conflict within him between his group loyalties, he will look around for a way to resolve it. Some North Koreans have resolved the conflict aroused in them by Soviet propaganda by conversion to Communism, others by becoming refugees, still others by trying to form a counterelite. Recently the Communists in eastern Europe have provided a means of confluence for such conflicting motives by—in effect—taking over the churches and making them speak with the voice of Communism, so that for many Greek Orthodox Christians the conflict between denominational membership and Party affiliation is removed. In any such case, however, the conflict of motives and needs provides the battleground for the propagandist, and the winner is the one who can best make use of the mechanisms we have outlined and suggest a way out of the conflict that is satisfactory to the maximum possible number of target individuals.

How Groups Work: The Group and The Individual

Persons find themselves members of some groups by birth or because of some other event over which they have no control (for example, Bavarians, the white race, blue-eyed people, people who are inconvenienced by a cut in food rations). Other groups they join because those groups meet some personality need. That is, an individual joins the classificatory group listening to a broadcast by his chief of state because the broadcast promises to meet his need for structure and understanding. He joins a labor union or a chamber of commerce because that functional group helps protect his job and thus relieves some of his anxiety. He joins with an individual of the opposite sex to form a functional group of two on a park bench because it is spring and because they have biological drives that need to be reduced.

There are, in other words, specific and identifiable needs that groups come into being to meet. There are also some general needs that are common to all functional groups. These groups help to meet the need all normal persons feel to "belong"—to be accepted, to be understood, to be a part of something bigger than themselves. The primary group is therefore not the only device for satisfying the need for belongingness. The labor union and the chamber of commerce do not merely protect the individual's economic interest; they also let him belong to a

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

friendly, functioning group. Even the group of two on a park bench does more than meet biological drives; it also gives the members a sense of being understood and loved and secure.

Another general need that functional groups meet is the need for power or dominance. Some persons have this need in greater degree than others. Some may be satisfied merely to identify with the group in its successes; others may get their greatest satisfactions out of acting as leaders. Groups provide different experiences for different persons. There is good reason to think that groups satisfy the current needs of their dominant members better than those of other members, but in any case there is a variety of choices of role experience, and at different times the roles within a group change in character and may even change hands. The leader dealing with one problem may not be the leader when the group faces a different problem. The expert may be the leader in one situation and a submissive follower in another.

Functional groups tend to develop, among other things, a core of common beliefs. These grow out of the needs of the individual members, and it is easy to see how a common core develops. For one thing the prospect of satisfying certain needs is the chief reason why persons join one group rather than another. Once in the group, the process of interaction operates to select the members who will stay in; those who tend to disagree with the common core of belief tend to leave the group. Furthermore most groups have a certain amount of doctrine, either handed down (as in a church) or expressed by dominant members, which serves to shape the members and their attitudes to the common pattern. And in a very real sense the members of a functional group tend to have about the same experience; they face the same problems, receive the same information, identify with the same leaders, learn the same rationalizations. This does not mean that the belief pattern of a group is necessarily static, for, although the core of beliefs arises out of the needs of the members, it in turn gives rise to new needs. An example is that of the broadcasters of this country, who came together in a group to protect their practices and found themselves in need of a new code of practices, which they devised. In any case, this may be said with confidence: beliefs held by an individual in common with a group are likely to resist change very strongly.

Why this should be the case, you can see from the description just given. The group tends to select its members, integrate them, give them the same experiences, reward the same responses,

ORO-T-214

129

SECURITY **RESTRICTED** INFORMATION

SECURITY RESTRICTED INFORMATION

and build up a loyalty out of the experience of belonging. It teaches roles and role patterns, and these in particular are products of group processes and hard to change without group interaction changing them. It tends to give its members the same frame of reference on common problems, and, in this one area of their lives, at least, the same general pattern of behavior. There is a natural tendency to continue any such comfortable and rewarding arrangement. Members want their groups to go on, even in the midst of change. Members do not want to be the first to renounce the old loyalties. Thus a hard core of belief and behavior grows up around a group. For psywar this is not necessarily a discouraging fact even where psywar is called on to buck it rather than maintain it. It does point to an area where frontal attack on attitudes may prove very difficult, but it also reminds us that if the group itself can be tied into psywar's mission, if the discipline it imposes on its members can be enlisted on psywar's side, then the operator's task is greatly simplified. The great feats of psywar always consist in getting groups inside the target to take on psywar's job, or at least the later phases of it, themselves.

Thus it is important at this point to ask how groups act.

The Group in Action

The pertinent question here for psywar is, What can be said in general about the group vs the individual, that is, about the quality of group decisions as compared to those at which the individual members would arrive if left to their own devices? And what changes can be brought about via group interaction that cannot be brought about via individual action?

For one thing there is a presumption that group decisions will prevail over those of isolated individuals on questions of perceptual fact and the evaluation of perceptual materials. An individual may perceive some lights in the sky, but when he talks it over with the group they put their perceptions together; decide on the number, size, and shape; and perhaps evaluate the lights as flying saucers. Individuals in a group may have different tentative evaluations of an enemy propaganda broadcast offering peace. When they bring this subject to the group and talk it over, a consensus emerges, and the group decision helps to dispel the area of vagueness. "What do you think of this new candidate?" one member of a group asks others, and gradually a group decision comes into being to modify and integrate individual decisions. In any such decisions as these, of course, the leader is a very

SECURITY **RESTRICTED** INFORMATION

important factor, and control of leadership is in many cases tantamount to control of the group.

In the second place it is apparent that only by group interaction can group norms be modified and social change accomplished. Let us not get caught up in language here. By group norms we mean the group standards of what it is right to do and believe. By interaction we mean discussion, one-way communication (bulletins, orders, etc.), coercion if any (for example, reward and punishment), and all the other ways that members of a group have an impact on each other. Now obviously one of the great reasons for addressing psywar to groups is that groups have the power to change their norms, for instance, to change the way their members think about Communism, or their accepted attitude toward the United States of America. And one of the chief reasons for directing psywar to functional groups is that by so doing there is some hope of accomplishing interaction; for example, getting the psywar message discussed and evaluated. The question then arises, what kind of interaction is likely to change attitudes in groups?

Festinger,²¹ on the basis of an experiment with changing attitudes in a housing project, developed three generalizations in answer to this question. He says in the first place that contacts help produce attitude change only if they entail transmission of evaluative statements by other persons about the object of the attitude. These may be either verbal and explicit or behavioral, but they must represent an evaluation (it is good, it is bad; it is better than this, worse than this; it is dangerous; it is what we need, etc.) In the second place, and conversely, contacts will not be effective in changing attitudes if they merely contain information about the objects of the attitudes. This kind of interaction may change the cognitive structures (knowledge) but does not appear to change evaluations of the object or emotional feelings about it. Third, as might be expected, the effectiveness of communicated attitudes varies with the many relations between communicator and recipient. For example, the leader of the group may carry more weight with his opinion. A person to whom one is strongly attracted, or whom one confidently trusts, will carry more weight.

The psywar implications of these conclusions are that if we are going to try to change attitudes in a functional group we must (a) relate the message to a strong need or an emotionally involved attitude, so as to be sure of getting it discussed, (b) relate our message closely enough to obvious rewards or to enduring

ORO-T-214

131

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

personality structures in the group, so as to be sure of getting some favorable evaluations, and (c) if possible, try to suggest responses and rewards that will get group leaders to evaluate the message favorably.

There are other ways in which groups may be used to control social change. One we have already suggested in talking about the way a group tends to integrate its members' beliefs. A group, we said, has the power to make its members conform and therefore to prevent social changes. A group can coerce its members by reducing their status in the group, by penalizing them in terms of property (for example, fining them), or by holding over them the threat of being expelled. A group, we said further, can to a great extent control what its members learn about a given problem, what examples they see, what evaluations they are offered to choose among. And a group builds up loyalty and a desire for the group to continue, which tends to keep members in the fold even after they have ceased to believe in the old norms. There is a fairly familiar situation that Katz and Schanck²² have called "pluralistic ignorance," a situation in which no one believes, but everyone believes everyone else still believes, and no individual wants to be the only one to question the belief.

Thus group action may be used to keep things as they are, maintain standards, keep down defiance, and hold the ground against change. Or it can be used to accomplish change, peacefully or violently. Two special cases of the way groups accomplish change—one without, one with violence—are especially interesting to psywar.

Public Opinion. We have defined a public as a group confronted by an issue and under some pressure to reach a decision on it. In any society, therefore, there are many publics and many issues. The more communication, the larger the publics can be, and the more numerous the issues. In fact the size of a public is governed by the number of people to whom a given issue is important, and by the length of the channels for intercommunications. Whether to build a new waterworks in Cedar Rapids, Iowa, is not an important issue to many persons outside Cedar Rapids; but even a nationwide issue can be confined to a very small public if, for example, a totalitarian government closes the communication lines (for instance, if the Politburo chooses to have no public discussion about who succeeds Stalin).

An issue is simply a problem that calls forth a sense of need or threat in the group. Most psywar messages therefore pose issues. The first response to these issues is almost al-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

ways on an individual basis, that is, that of persons who read or heard the message and have not yet discussed it or heard it discussed by anyone else. At this stage we may say that opinion is latent or unformed. Then, however, the group processes begin, unless they are inhibited by censorship or distraction. Intercommunication takes place. People talk the issue over with one another. Newspapers write about it. Political leaders make public speeches about it. This is the period of sharpening the issue, making clear the rewards of possible responses, simplifying the facts so that people hold practically identical information, trying argument against argument. Psywar can affect matters in this stage as well as the initial one, of course, and not necessarily or exclusively by verbal communication. It is precisely at this stage of public opinion that the totalitarian countries have always staged military maneuvers near the border of whatever country they are trying to influence.

If public opinion follows its full pattern, interaction will finally lead to a sharp question on which people can express their views and on which a decision can be taken (shall we go to war? shall we elect X or Y as President? shall we ratify the treaty?). The individual has to decide for himself what kind of action is most likely to meet the need or remove the threat the issue poses, but he also feels a need to merge into a group consensus. The larger the group, to be sure, the easier it is for minority stands to be made and minority views to circulate. But by one means or other the group has to arrive at a working understanding.

We are talking about propaganda and public opinion as though the propagandist had free access and as though the public had free expression. This is not true in the totalitarian countries to which America directs psywar. In those countries the engineering of consent is often a fine art, but it is not the art of discussion and compromise as we practice it in the United States. It is a matter of the deliberate control of information and the expression of opinion, of the use of emotional symbols and, where necessary, of coercion. In the Communist states the engineering of consent often looks to an outsider like a matter of teaching conditioned responses desired by the leaders. Even against this situation, of course, psywar is not helpless. It can interfere with the communications monopoly. It can introduce information of its own, make use of counter prestige figures, flaunt its own symbols, and suggest other responses and their attendant rewards. It can try to arouse dissatisfaction with the engineered decision. But always it must ask the realistic ques-

tion: how much is this accomplishing? For in a tightly controlled totalitarian state, the sources of change and policy are seldom publics acting in the way we have described.

In a freer situation, of course, psywar can use all the mechanisms and processes we have been describing in this book, for public opinion is the traditional battleground of propaganda.

Let us review some of the weapons the propagandist has at hand for influencing public opinion:

(1) He knows, and will make constant use of, devices for gaining attention (novelty, contrast, color, figure-ground relations, etc.).

(2) He makes it his business to get at least enough communication time for his messages to be widely heard or seen so that he can repeat them with variations (Goebbels said, "Don't argue; just assert and assert"). The Russians, too, apparently believe in the practice of saying something over so often that the reader's or listener's original objections to it may be forgotten.

(3) He will see to it that his messages appeal to strong needs and anxieties in his target audiences, and especially to emotionally involved needs.

(4) Wherever possible he will try to make use of the target's firmly held attitudes, diverting them slightly in the direction required by his mission.

(5) Where he wants a real attitude change, he will work if possible in the area where attitudes are weakly held or where information is vague and where there is a felt need for structuring.

(6) He will try to get functional groups (religious, political, labor, business, women's, education) at work on his side.

(7) He will try to get the target to think of the propagandist's views as expressions of an in-group, and of the opposition's views as those of an out-group.

(8) He will try to get the target to identify with the leaders of the operator's side ("I can understand them; I feel like that too.").

(9) He will use prestige figures for testimonials and try to persuade the target to join the band wagon.

(10) He will introduce emotionally loaded symbols and slogans to dramatize the responses he wants the target to make.

(11) He will be on hand at the right moment with a pattern of confluence to resolve any conflict in a manner favorable to his mission.

(12) He will be ready with rationalizations for any unpopular position his side has to take.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

(13) If aggression exists, he will try to displace it onto a substitute among his opponents.

(14) He will try to appeal to ego-involved motives in his target audience (this is your battle we are waging; this counter-elite is looking out for you; you are the greatest people on earth and deserve better from your neighbors; we need you).

The Crowd. A crowd is a spontaneous grouping of people drawn together by an event. Ordinarily crowds have very little to do directly with social change. For example, the casual crowd that gathers to look in a toystore window is not going to establish any new norms or overthrow a government. Nor is the crowd at a football or baseball game likely to change anything; indeed this is one of the most conventionalized of all groups, as the cheers, the peanuts, and the traditional patterns of behavior indicate. But there are occasions when a casual crowd is transformed into an acting crowd, and then it becomes a vicious and irrational instrument. This is what we know as a "lynching mob" or a "riot." The behavior of one such acting crowd is described in the following: 23

LION TAMER

Koje Island's new prison commandant, a first-class combat man, emerged last week as a soldier who could also use his wits in the most disagreeable of rear-area jobs. Boldly and shrewdly, Brigadier General Haydon L. Boatner had chosen Compound 76, scene of the Dodd-Colson coup, as the first to be tackled in bringing order to the prison. After the bloody battle in which Compound 76's 6000 hard-core Communists were subdued (*Time*, June 16), the other tough enclosures on Kojé toppled like ninepins, with no further fighting between guards and prisoners. By week's end, some 30,000 prisoners had been moved into smaller enclosures, where they were searched and fingerprinted. During the cleanup, nearly 800 anti-Communists had escaped from Communist control and were safely segregated, and more than 100 ringleaders in kangaroo-court murders had been identified, dragged out and isolated. It seemed physically impossible that any further mass rebellion could occur. Reported "Bull" Boatner: "The worst is over."

Meanwhile, the prisoner death list following the battle of Compound 76 rose to 41 (plus one US paratrooper). At least twelve of these were killed by last-ditch fanatics for refusing to fight or for trying to obey Boatner's orders, some were bayoneted in the trenches by US paratroopers, and others died in buildings captured only after concussion grenades were tossed in. The Americans did not fire a shot, although the prisoners fought with spears, homemade swords, clubs and barbed-wire flails. Also found were maps which indicated that a Communist capture of the whole island had been planned.

Kangaroo Courts. When the order to move went to the next pen—Compound 75—the inmates, who had watched the battle of 76, lined up meekly and were taken away. Compound 77 was next, and it was here that Bull Boatner made his one tactical mistake of the week. He gave

SECURITY **RESTRICTED** INFORMATION

77 a day's advance notice of the move, and the Communists inside used their last night to execute anti-Communists. After the evacuation, 16 bodies were found, hacked, beaten or strangled, tossed into water-filled ditches, jammed into metal drums, and even hidden under hut floors. Compound 77's kangaroo courts had not found all of the anti-Communists, however; 55 more broke away next day.

Boatner's paratroops moved on to Compound 95. While the prisoners were being moved, interpreters passed orders for the column to turn left, but added that anti-Communists could fall out to the right. No fewer than 400 anti-Communists turned to the right. Some of these dashed their red-starred caps to the ground.

Boatner expected some trouble from the swaggering, defiant North Korean officers of Compound 66, but after he had taken representatives from the enclosure on a tour of the blond-spattered ruins of Compound 76, the officers marched out in orderly ranks, five abreast. As a reward for obedience and a mark of respect for their rank, Boatner ordered the machineguns on the watchtowers turned skyward during the transfer. Only one North Korean officer stepped out of ranks; he identified himself as an anti-Communist.

Pens and Runways. The new prison pens, intended to house no more than 520 men each, measure some 200 by 155 ft. and are surrounded by a double fence of barbed wire. They are arranged in groups of eight in larger enclosures, which are also fenced with double barriers of barbed wire. The large enclosures are traversed by a central barbed-wire runway, which makes it easy for guards to reach any of the smaller pens with tear gas. Constant and thorough searches, and floodlighting at night are expected to prevent the prisoners from cutting the wire and thus assembling in larger groups.

After being herded into the small pens, the battered survivors of Compound 76 had still not had enough. Three times in one day they disobeyed orders; each time they were brought to heel by tear-gas barrages. One anti-Communist, hardly more than four feet tall, seized his chance to scramble under the wire of his pen, lacerating his back but getting away just ahead of clutching Communist fingers. He said he had been sentenced to death, and he then put the finger on 102 members of kangaroo courts. These malefactors were dragged out by US guards for isolation.

At week's end, like a lion tamer who disdains whip, chair and pistol, Bull Boatner entered one of the new pens and walked alone, unarmed and unmolested, among the prisoners. He had cowed the unruly Communists and had done much to restore US prestige lost by previous pampering and bungling.*

How does an acting crowd come into existence? It starts with some exciting and dramatic event. Perhaps it is a report of a rape, or a threat, or some harm done to a person who should have been protected. Whatever the exact cause, the event catches the attention of individuals and builds up a high state of tension in them. They begin to mill around. This is typical acting-crowd behavior. They talk to each other, communicate their excitement, build tension in one another, and often generate a surprisingly close rapport among themselves. Then a common object of attention emerges as a focus of the crowd tension. Sometimes this is the

*Reprinted by permission of author and publisher.

SECURITY **RESTRICTED** INFORMATION

event that started the whole process. More often it is a related or substitute symbol that develops during the period of milling around. For example, if they can't get at a man, they may burn his home, or a friend's home, or the jail. But someone yells, "Look, they've got him over at the jail!" Or, "Jeff just saw him down behind the coal shed; those lily-livered police aren't even going after him!" And the crowd tension spills over into mob action.

Now the question is, how by means of communication can we control the acting crowd? The crowd is nearly hysterical by the end of the milling process. It is highly suggestible, but its general direction of response is very well determined. In other words, anything we say to such a crowd will be ignored or rejected unless it falls within the general direction of the aroused impulse. It does little good to reason with a crowd or plead with them.

If a psywar operator wants to use and direct such an acting crowd, it would appear that the key time is near the end of the milling process, when they are beginning to look for an object on which to focus their aggression. That is the time when a leader or even a "plant" in the crowd can suggest a victim, or an objective, and if it is closely enough related to the original objective get it accepted.

If you want to stop an acting crowd, the earlier the better. The problem is to make a suggestion that breaks up the crowd's almost hypnotic focusing on a single object. There are three things to do: You can frighten them, so that each individual begins to worry more about his safety than about the group objectives. You can sow discord within the crowd, so that its members end up fighting among themselves, in which case also attention is diverted from group to individual problems. Or you can diffuse their attention to more than one objective, in which case the crowd loses the unity that has sustained it.

The secret of a crowd's strength, of course, is the anonymity of the members. It makes a difference when a man knows that others know what he is doing. If they know, he realizes that he has certain role patterns he is expected to follow and that anything he does will be subject to social sanctions and individual approval or disapproval. This has been demonstrated experimentally again and again. And the principle always emerges that under conditions of anonymity it is possible to do things one wants to do but dares not when his identity is known. The hysteria of a crowd and the cloak of anonymity release pent-up aggressions and repressed sadism that would never come out otherwise.

ORO-T-214

RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATIONMorale

The signs of group morale are perhaps easier to see and sense than to describe. Essentially they are cohesiveness and a sense of purpose and accomplishment. In a group that has really high morale the cohesiveness comes from inside; it is not imposed by outside authority but rather comes from mutual liking and respect, a minimum of friction between personalities, and flexibility enough to take care of little interpersonal problems without letting them interfere with the job. Some of this cohesive spirit, it is true, may be evoked by outside threat—as happened in the United States at the time of Pearl Harbor—but even so it will last for a shorter time, and the group will work less well, than if there is a true basis for liking and cooperation within the group. This group feeling shows up as loyalty, involvement, solidarity, pride in the group—indeed, members of a group with high morale will almost always prefer their own group to all others.

A group with high morale is always one with a clearness of purpose to which the individual ambitions and goals of the members are subordinated. The group must be conscious of a job to do and of doing that job. Each member must have a role in the job and a sense of accomplishment in it. And the rate of aspiration must be realistic; as Lewin and coworkers²¹ say, the "next goal somewhat, but not too much, above (the) last achievement."

You will find it interesting to study some sociograms of groups,^{25,26} such as those in Figs. 2 and 3. Sociograms indicate what the members of a group think of each other. These particular ones were developed by asking members of two Naval air squadrons which group members they would like to fly with and which ones they would not. A solid line indicates a positive answer, a dotted line a rejection. Notice that in Fig. 2 a large number of the men would like to fly with the commander or his executive; choices were widely distributed, and there were no signs of cliques within the structure. In the other squadron (Fig. 3), no members even mentioned the commanding officer in stating choices. A number of members mentioned the executive, but only to say they didn't want to fly with him. The incidence of dotted lines inside the group is higher than that of solid ones. And there are two cliques—two groups of four—who choose each other and no one else. In the first squadron (Fig. 2), no one said he wanted to fly with someone outside the squadron; in the second squadron (Fig. 3), four members preferred to fly with outsiders. You hardly have to be told which squadron had higher morale.

ORO-T-214

139

RESTRICTED

SECURITY **RESTRICTED** INFORMATION

These signs of morale are important to the psywar operator because he needs to know what kind of groups he is facing. He would like to have groups with high morale on his side, and if he finds high morale on the other side, he would like to break it down.

How would one go about attacking morale? The most effective way is to attack the interpersonal relations within the group. The Communist tactic of "boring from within" is more than a newspaperman's phrase. One agitator inserted into a group can contaminate the whole structure, as surely as a worm can contaminate an apple. The most vulnerable point is leadership, and if the agitator can undermine the members' faith in their leader he will be a long way toward destroying the group morale. Another useful trick is to turn the attention of group members from the group objective toward their own problems and objectives, that is, toward their own ambitions, toward their frictions with fellow members, toward their own worries. Still another device is to have the group goal set impossibly high, so that the whole group is frustrated. One Communist device is to insert a Party member into a group with instructions simply to do in an extreme way what the group is supposed to do. If the group is championing labor, he is the most vigorous champion; he wants the most strikes, he has the most complaints against management. Thus he builds up tension and frustration, and to the extent that he becomes a leader he can later turn the group toward his own goals.

Group disintegration is easier to accomplish from inside than from without. Nevertheless something can be done about it by communication from outside, and one of the chief weapons for this purpose is the device we call "privatization." This is simply a matter of trying to get the individual members of a group to be concerned with their own needs and problems, and to think about those rather than their group objectives and responsibilities. If, for example, we can get enemy troops to brood over their loneliness, hardships, and deprivations, they will not be very efficient group members. Similarly, if we can make them believe that they are not accomplishing their goal—for example, that they are losing the war—and especially if we can make them believe that their leaders are misleading them, then we have the situation for group disintegration.

But even in a situation like this the group may keep on functioning. The Strategic Bombing Survey²⁷ of 1946 showed that the German factories kept right on producing when morale was at a low ebb and when the workers thought the war was lost and bitterly

ORO-T-214

RESTRICTED

SECURITY **RESTRICTED** INFORMATION

blamed the Nazi leaders. Role habits were ingrained, and there was fairly habitual repression in Nazi society, just as in most other totalitarian societies we have to deal with.

Suppose you want to build morale in a target group. You will try to rearrange personnel so that frictions will be minimized. You will see that the group has a clear assignment and a goal far enough but not too far above its last achievement. You will see that each member has a job that contributes to the group job. You will try to get the members to identify with the group. Perhaps the key will be the selection of a good leader, whom the members will recognize as a leader, and follow. That brings us to talk about leadership.

Leadership

Some leaders work into the job through group interaction, for example by election or recognition. Others, such as army officers, are put into positions of leadership by outside authority. In either case, the leader has fairly definite functions in the group. Krech and Crutchfield²⁶ name a number of these:

He is the executive. In other words he has the final responsibility for seeing that the group assignment is carried out.

He is planner and policy maker—either himself or as custodian of plans and policies formulated by others.

He is expert. Often he gets to be a leader because of his expert knowledge. Or he knows how to use experts.

He represents the group. He is their spokesman and the man through whom outsiders speak to the group. Thus, as Lewin and coworkers²⁴ say, he is a kind of "gatekeeper" for communication into and out of the group.

He controls relations within the group—both role assignments and interpersonal relations. He therefore is in a position to arbitrate between members and to reward and to punish.

He serves as an example or a symbol for the group. The officer must exemplify bravery; the minister must exemplify godliness. A leader such as a general or a king comes to symbolize more than relations between persons; he stands for the tradition and continuity of the group. He may become a kind of father figure, as many leaders have become in times of crisis. Roosevelt, Hitler, Stalin, and Churchill all took on aspects of the father figure. He may become a philosopher or spiritual leader of the group as, for example, Gandhi did. And, whatever happens, he is likely to get the praise or blame for what the group does. If the group fails, if

SECURITY **RESTRICTED** INFORMATION

it loses the war, for example, the members are likely to turn savagely on the leader and project onto him all their own guilt and disappointment.

This is what a group expects of its leader, even though the importance of the duties varies from group to group, and the members may in no case analyze the job description exactly as we have done. When psywar attacks a leader it tries to undermine confidence in him by showing that he has not been carrying out these duties. For example:

As executive he can't delegate responsibility and is therefore a bottleneck for the whole group.

As planner or policy maker he consults no one except himself. The group does only what he wants it to do. Or he doesn't know what he is doing or where the group is going.

He pretends to be an expert but is really ignorant.

He is a poor representative. He doesn't speak the truth when he talks for the group or when he reports what other people say to the group. Or perhaps other groups laugh at him—is he the best you have for a leader?

He isn't fair with his group members. He plays favorites. He doesn't care about the problems of his group members.

He is a bad example. The officer really is a coward; the minister leads a licentious life in private; the political leader is really in it for the graft he can pick up. Furthermore he is responsible for the group's failures, if any. And he is leading, inevitably, toward failure.

If these lines of attack sound familiar, remember that not all the propagandists are in psywar directed at foreign targets.

Lewin, Lippitt, and White²⁴ and others of the group dynamics school have studied in experimental situations the difference between democratic and authoritarian leadership. They organized groups of children and young people and assigned definite roles for the leaders to play, either authoritarian or democratic. The groups were then given tasks to do, and the results were recorded. They noticed these differences between the behaviors of the two kinds of group:

(1) There is more pent-up aggression in the authoritarian group. This seems to be the result of frustration resulting from the leader's tight control and is usually diverted to scapegoats or repressed until the leader is absent.

(2) In the authoritarian groups there is more fawning over the leader, more meekness in approaches to him, and more demands for his attention and praise.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

(3) In the authoritarian groups there is more "I feeling"; in the democratic groups, more "we feeling." Members of the authoritarian groups seem to be more aggressive and dominating toward each other.

(4) When the authoritarian leader is absent, the work level declines sharply. When the democratic leader is absent, the work level goes down only a little.

(5) When frustration is experimentally introduced into the situation, the authoritarian group members tend to take out their aggressions on each other. They blame each other for awkwardness, poor planning, etc. Democratic groups are more likely to think things out or to draw together for organized attacks on the obstacle.

These results must not necessarily be interpreted as favorable to democratic group organization in all circumstances. When faced by threat from outside the group, people often seek authoritarian leadership: "Tell me what to do," they plead. It is noteworthy that authoritarian states try to keep their people feeling a constant sense of threat from outside, as the Soviet Union has been doing for a number of years. People who are emotionally insecure gravitate toward authoritarian leaders, as all "men on horseback" have known. Finally it should be added that in many parts of the world the role patterns have grown up in an authoritarian mold, and there is little motivation to change them.

But suppose that psywar has to deal with authoritarian groups. The findings of Lewin, Lippett, and White,²⁴ and their associates suggest ways of going about it. For one thing the leader is such a key figure in the authoritarian structure that he is an obvious target for attack. By the same token, however, an authoritarian leader is less vulnerable to successful attack. The chiefs of state of totalitarian nations are ordinarily so protected by emotional symbolism and so accepted by the people as father figures that attacks on them may be futile. But the lesser leaders are vulnerable. And if one of these can be removed or made less effective, then we have reason to hope that the effectiveness of his whole group will markedly decline, at least until another leader is substituted.

Likewise it is safe to assume that a good deal of aggressiveness will be pent up in authoritarian groups. If this can be diverted against fellow group members or subleaders, then the efficiency of the group will decline.

ORO-T-214

143

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONSummary

Without trying to repeat the details of the preceding pages, let us sum up the psywar operator's concept of groups in his target population.

1. They are (for him) clusters of roles and characteristics in the target population. This helps him to define his target, since such clusters in large part determine the amount and direction of possible change. For example, the relative roles of young people and their elders in China minimized social change for centuries. The competitive role patterns between men and women in the United States contribute to the high divorce rate.
2. They are custodians of morale in the target population and are consequently the chief points of attack if one wishes to raise or lower morale.
3. They are the chief determiners of how the target will react to psywar messages, because of group interaction on perceptual facts and because of role patterns and other pressures to conform within the group.
4. They are dynamic forces that may sometimes—dramatically in the case of an acting crowd, less dramatically in the case of public opinion formation—be mobilized to speed social change.

ATTITUDES INTO ACTION

The ultimate goal of psywar is action. Sometimes this goal is directly expressed, as for example when a psywar operator tries to persuade a beleaguered garrison to surrender. More often the action goal is held back, taken for granted, implied, or deliberately left unspecified (for the target to figure out for itself). If we try by means of psywar to lower the morale of troops, we are taking it for granted that as a result of lowered morale they will fight less efficiently; we don't have to say it. As we try to plant suspicion of leaders in the minds of a target population, we are taking it for granted that suspicious people may cooperate less effectively and obey less readily. (We may be holding back an action appeal for the overthrow of these leaders and contenting ourselves, for the moment, with getting the target into an appropriate frame of mind.) If we try to build friendship for ourselves in a target population, we may find it wise to do no more than simply that; given a choice involving

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

policy, our friends will then make the choice in favor of us. If we are trying to influence elections in a target country, we may, to avoid a boomerang effect, not specify voting for the out-elite as the action we want; we merely attack the present elite.

Changing an attitude in the direction we desire does not necessarily mean that action in the desired direction will automatically follow. Attitudes do not cause action; they direct action. We have called attitudes "signposts," because they point the direction action will take if action takes place at all. Newcomb²⁸ defines attitudes as "readiness to be motivated." Other things being equal, if a person is motivated to act, he will find a built-in compass by which to steer his action. That is the significance of an attitude to the psywar operator.

Let us take an example. A person has a strong attitude in favor of beef over pork. But no action is likely to take place that brings that preference into play unless his hunger drive is aroused. Even then it may be impossible for him to find beef. He may become so hungry that his need generalizes and he may even be willing to eat pork. When he has eaten, his drive is reduced and he no longer has a strong motivation to find a beef-steak, although he may feel a certain sense of frustration over having been unable to surmount the barrier in the way of his preference for beef.

Consider another example. Psywar succeeds in developing within a citizen of a Communist country a strong attitude of disapproval for the Communist regime. Let us suppose that he is also motivated to action along the line of that attitude. Let us say, for example, that his local Communist government has confiscated his rice and kept him working long overtime hours to earn food, spied on him, and restricted his movements, and that he wants to do something about it. Will action result? This depends on a number of factors, quite independent of the attitude itself. The man may simply not have the kind of personality it takes to resist a government or endanger himself by subversive action. Others of his attitudes (for example, in favor of protecting his family from harm) may conflict with the attitude that favors doing something. The response of resistance and revolution may not be in the culture pattern; its "little man" may have gotten used, through centuries of domination, to the idea that he is to be seen and not heard, that he is to be pushed around by a dominant class, that he is often to be hungry and weary, and that probably all this is for the best. More likely the police power

RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATION

and surveillance may be so strict that he cannot find an opening. What will he do? He may displace his aggression on his family or his fellow workers; he may rationalize the situation, as we suggested a moment ago: "this is bad but it could be worse, and probably things are all for the best"; he may repress his aggression—he may do any or all of these things until a way opens up by which he can act on his anti-Communist do-something-about-it attitude.

We said previously that action would take place along the compass line of the attitude, other things being equal. But "other things" are seldom equal. Therefore it is important for us to consider some of these other things that enter into the complicated practical relation of attitudes to action.

Relation of Attitudes to Action

We can suggest a few principles that seem to apply to the relation of attitudes to action:

1. For a change in attitude to be a valid indicator of action, there must be either (a) a present or impending radical change in social structuring, or (b) important changes in the personality structure of the person, or (c) both. There is always a tendency to think that the process that brings these changes about is simple. The psychotherapist, the criminologist, the evangelist all know it is not. The evangelist is accustomed to see some of his supposed "converts" doing things wholly incompatible with the new attitudes they have claimed to hold. The criminologist knows how important it is to be able to hold the threat of imprisonment over a potential criminal's head, and how often it helps to take a bad boy out of his environment and put him in a wholly new one. The psychotherapist knows that very often the medicine for an ailing personality has to be complete reeducation.

Everything we have been able to observe about the action processes of psywar indicates that ordinarily at least one of the two factors mentioned above must be influenced in a powerful manner if we are going to accomplish action. For example, if we hope to secure a real change of heart through psywar in political or consolidation situations, we need an educational process of considerable scope, which may range from textbooks and youth organizations to the indoctrination of tourists and careful treatment of visiting dignitaries—in addition to the usual devices of the long-distance mass media. To secure surrenders in a tactical situation, as we have found out by bitter experience, it

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

is ordinarily not enough to deliver attractive leaflets and persuasive broadcasts. We must also display military power and restructure the environment sufficiently to threaten the target individuals.

The fact that both these factors may be influenced in most psywar situations gives us a welcome leverage. For example, in political and consolidation operations we can employ not only the devices of propaganda but also the reinforcement of economic, diplomatic, and potential military operations. In tactical psywar we can combine coercive with noncoercive measures and supplement one with another. In strategic psywar we can to some extent make up for the weakness of having to communicate at long distance by using the threat of military action; for example, bombers in the sky. Therefore we can bring about action in many instances without the long-time program necessary to secure really basic changes in personality structure.

2. The drive strength of an attitude is related to the likelihood of action resulting in the direction of the attitude. We have not defined an attitude very sharply, and indeed there isn't a very close consensus among psychologists as to the exact way an attitude works among the other components of personality. But there is general agreement that attitudes have the dimension of intensity, that is, they are held strongly or weakly. Furthermore they have a dynamic quality, a "dynamic, insistent, stirred up property," one psychologist calls it. In contrast to knowledge and beliefs, which are relatively neutral, attitudes are actively pro or anti. They "lean toward action," or, more accurately, they mediate between the fundamental psychological processes and action. They are closely related to drives and often are clothed with emotion. Therefore we sometimes say that attitudes which are closely related to basic and powerful drives, especially if they tend to call up emotion and ego motivations, have drive strength. And action is probably somewhat more likely to result from this kind of attitude than from another.

In a sense this is simply saying what we have previously said about the need in psywar to restructure personality. The object in trying to change personality is to place strong motivation behind the desired attitude. This is what happens in cases of conversion, where the attitudes usually acquire great drive strength. If the drive strength of the attitude of preference for beef over pork, which we mentioned previously, had been great enough, the individual would doubtless have resisted eating pork, even if he was very hungry. Among Mohammedan people, for example, such

ORO-T-214

147

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

an attitude would presumably have had sufficient drive strength to accomplish this result.

3. If action in the direction indicated by an attitude is likely to get strong group reinforcement, then such action is more likely to result. This, like the preceding principle, is really a special case of the first principle. Group reinforcement is one of the means that can be used in restructuring the individual's environment. We have seen how people seek to "belong" and how they learn roles and come to know group rules and norms. If an attitude points to an action in accord with those roles and norms, then the group will reward this action. And the action will be easier to take.

The importance of this for psywar is that it gives us another variable to manipulate. We are in position not only to suggest actions that will get group reinforcement but also often in position to provide the group itself. The Communists are careful to provide well-organized groups into which to bring their converts and through which to reinforce the kinds of action expected of Party members. Practically every attempt at subversion in an enemy country includes group organization, an underground or a counterelite, not only to make action more effective but to make it more palatable for the individual. Nor is this device limited to subversive activities. Just as a well-run boys club in a tough district can help combat tendencies toward delinquency by furnishing group reinforcement for other kinds of action, so can parallel organizations be established in neutral or occupied countries. The English-speaking Union, the Committee to Help Ourselves by Helping the Allies, the Friends of the Soviet Union, and in fact many of the ethnic clubs and societies are domestic examples with which we are all familiar.

4. Action in the direction indicated by an attitude will be more likely if channels exist for its expression, less likely if barriers exist. Channels and barriers are the chief variables we can manipulate beyond the attitudinal stage itself. They may exist in the personality or in the environment. We have just given some examples. A strong motive to eat beef may be a barrier to eating pork, whereas a rationalization may clear the channel for expressing the hunger drive on a pork chop. Group censure of deviant political action may be a barrier in the way of subversion, whereas a new and subversively inclined group to which a person will be welcomed will provide a channel for subversive activity. Even after an attitude favorable to surrender has been built up among troops, the danger and unpleasantness of surrendering

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

may be a barrier to the action, whereas the provision of safe and simple surrender procedures may be a channel to bring in many prisoners.

Because these devices are so important in the process of converting attitudes into action, we are going to talk about some of the chief kinds of barriers and channels, and how they may be used.

Barriers and Channels to Action

It is obvious that a channel, as we are using the term, is the opposite, in effect, of a barrier. It may be to the interest of psywar to raise a barrier and thus close the channel to a given action, or to lift a barrier and provide a channel by which to facilitate the action.

Personality Barriers and Channels. We are not going to talk here about attitudes and drives, which are obviously necessary to action, but rather about some organizations of personality which are changeable or suggestible and which operate to inhibit or encourage actions. For example, conflict or confusion will inhibit action, and it may be desirable to produce such barriers in enemy targets. An enemy power figure who is confused (for example, by conflicting information as to our strength and intentions) will not be likely to make good policy. Segments of the enemy population that are experiencing strong conflict (for example, between their religion and their politics) may be less efficient, less loyal workers. On the other hand it may be desirable to provide a pattern of confluence for such persons, by which they can bring the conflicting drives into agreement and thus find a channel of action. For example, it might be possible to resolve such a conflict by working for a new government which would be more in accord with the religious attitudes and beliefs of the people in question.

Frustration, as we have seen, will sometimes produce withdrawal or regression. The psywar man may find it desirable, by calling attention to frustrations and deprivations, to lead enemy troops to withdraw from reality into daydreams, or to regress into a more childlike state, in which case they would certainly provide less capable opposition. Or, on the other hand, if we suspect friendly troops of daydreaming or other childlike behavior, we can look for the frustration that is causing it. If that frustration can't be removed, perhaps it can be combated with another positive motivation. For example, a unit of friendly

ORO-T-214

149

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

troops has been stationed far from home, in a theater which we control, and the need they were sent to meet has never developed. They are frustrated and lonely, they have very little to do, and their morale is low. Probably nothing can be done about their basic frustration, which stems from isolation and loneliness. But it might be possible to figure out a job for them to do, a danger for them to prepare for, a new kind of skill for them to learn, that would momentarily at least give them a channel for action and remove some of the frustration. This would be sound psywar on our part.

The displacement mechanism is really a barrier-channel process. Frustration results from the individual's finding himself up against a barrier to motivated action. As we have indicated, the psywar operator's mission often requires him to produce frustration in a target, because frustrated enemy soldiers and frustrated enemy workers are likely to be ineffectual opponents. But we know too that frustration tends to build up aggression and gives us a potential motivating force of great power to play on. The latter, however, we may be able to exploit, and keep from being turned against us, only as we provide a channel that leads it where we want it to go and that helps it to strike down the barriers that might prevent it from using that channel. If we can displace it against the enemy individual's immediate superiors, or his government, or his fellows, that is all to the good.*

Institutional Sanctions as Barriers and Channels. By "institutions" we mean the established forms or patterns by which continued group activity is carried on in society (for example, government, church, family, etc.). In each institution there are rules (express or implied), codes, and provisions for enforcement (rewards, punishment, expulsion, etc.), which make sure that the behaviors that basically distinguish the institution are forthcoming. The government has laws and police power to enforce them; the church has rules or, as the Methodists call them, "discipline," and uses excommunication and other less formal ways to keep its members in line; the family has the power to withdraw affection, company, or support, or even to exclude a member by separation or divorce. Let us call these "sanctions" or, more precisely, "institutional sanctions."

The psywar operator runs head on into institutional sanctions when he tries to direct messages to targets within a totalitarian country. States like those in the Soviet orbit severely penalize

*Where the target is an ally or a neutral, we may want to prevent frustration and keep aggression from being built up.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

resistant behavior and provide almost no channels through which deviant activity can express itself. So widespread and strong are the surveillance and police power of these states that it is almost impossible for a counterelite to raise its head. This constitutes a very powerful barrier to the types of action we are likely to want to encourage within those states.

If this represents a barrier that psywar will have to meet as best it can, there are other barriers that psywar, if it were able to erect or reerect them within the same group of states, would be able to use for its own purpose.⁵ For example, the Communist regimes have done much to break down the father dominance that characterized both Korean and Chinese families and tended to slow down social change. They have tried to give equal political and social rights to women, and to encourage the younger generation to be much more independent of their parents than they used to be. One of the sad types of story that keeps coming out of the Communist countries is that of children who have denounced their parents to the Party. Breaking down the old family structure, and especially the autocratic power of the father, of course helps the Communists to take over. But it is a safe assumption that the Communist onslaught has not been universally successful, and if by psywar we could appeal to the sense of tradition and fitness in the Oriental countries, and thereby put barriers in the way of the Communist changeover, it would be to our advantage.

It is hardly necessary to say that if any country seeks to encourage subversion in an enemy country it must try to provide channels for subversive activity that circumvent the sanctions of the enemy government. This means, usually, an underground organization, careful planning, logistic support, and communication with the underground in the form that will involve least risk for the members.

A favorite way of combating the sanctions of an opposing state is to try to emphasize the channels that are not officially disapproved but are irrelevant to the main purpose of the opposing government. For example, a peace campaign is a common psywar move to keep a country from getting ready for war. Witness the Soviet peace campaign of 1950 and the years following. We lost the initiative in that case, but one possible move might have been to turn the Soviet campaign back on them and do everything possible to get Russians within the Soviet Union actually working for peace and against armament. In general, any sanctioned activity that does not increase the power or preparedness of an enemy state can profitably be encouraged. If, for example, the

ORO-T-214

151

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Soviet Union could have persuaded England to channel its energies into a program of social security at the cost of military preparedness, it would have been well worth the Soviet's while. If it could have persuaded this country to divert its attention from the Soviet to any one of a hundred activities not contributing to preparedness, it would have tried to do so. More accurately, that is what it did.

Another way of combating opposing sanctions is to try to arouse conflicting sanctions. We have mentioned the conflict of church and Communism, and also of the Oriental family and Communism. Such conflict makes for frustration and anxiety and may provide a basis for deviant behavior.

Role Status and Social Norms. People trained to play submissive roles in a society will not ordinarily take on active political roles. This is a situation that psywar meets in all Oriental countries and, in general, throughout the totalitarian states. The role of the follower is closely circumscribed and presents a real barrier to any deviant political action originating with the masses. It is next to impossible to change a role pattern from outside. The idea that revolution can be incited by psywar in the masses of a totalitarian state, against the police power, the role structure, and the dominating ideology of the state, is what Speier²⁹ calls the "democratic fallacy" of psywar. In many states the status structure is quite rigid also. People in low status have relatively little chance to rise. Against that situation psywar has a choice of action. It can try to stimulate frustration in the low-status people over their inability to rise in status; this, of course, is the basis of the Russian campaigns to the "lower classes" and racial minorities. It is possible also to stimulate gripes about low pay, slow promotions, and privilege differentials in military groups.

Another way to face the status problem is to concentrate on the leaders. Obviously it is to our benefit to have good leaders in friendly groups, poor leaders in enemy groups. If an enemy group has a poor leader, it is therefore to our advantage to keep him there. We should not try to provide a channel for attacks on him; indeed, anything we can do to keep a barrier in the way of changing status within that group will be worth while. On the other hand, if he is a good leader, then the obvious psywar attack would be in the direction of undermining confidence in him, and encouraging cliques and antagonisms within his group. This calls in many situations for covert rather than overt attack. For example, rumors about the leader can be very effective. Also, if anything can be done to disrupt the communication lines between

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

leader and followers, the situation is being set for misunderstandings and tensions.

Surrender and subversion are almost always contrary to social norms. To provide motivation and channels for those activities is therefore important. It may be necessary also to rationalize the act, so as to get around the guilt feeling that arises from breaking, or thinking about breaking, the norms. One aspect of providing a channel in this kind of case is the giving of explicit directions and as much help as possible. People need to be told not only how to surrender but how to express their dissatisfaction in much less dramatic ways—how to withhold some of their crop or malingering in their work or pass around the news they smuggle in via radio or messenger.

Informal Group Censure. We have so far been talking about the more formal methods of social control. Groups, however, have their own informal ways of keeping their members in line and bringing them back into line when, from the group's point of view, they are misbehaving. These sanctions operate partly through the threat of exclusion but also through the threat of losing status and communication. Festinger²¹ has advanced the hypothesis, based on experiments with small groups, that pressures toward uniformity arise from what he calls "social reality" and "group locomotion." By social reality he means the degree to which justification for beliefs, attitudes, and actions rests on common acceptance within the group. The greater the social reality, the greater the pressures for uniformity. By group locomotion he refers to the pressures toward uniformity that arise among members of a group "because such uniformity is desirable or necessary in order for the group to move toward some goal which it has."

The more cohesive the group, the more likely it is that issues are to be talked about when differences of opinion arise, and the more likely it is that members who can't adjust their opinions to the group standard are to be excluded from the group. Therefore cohesive groups have more success than others in changing the viewpoints of their deviant members. The tendency to change the membership of the group increases also with the relevance of the issue to the group's goal. These are parts of a considerable body of hypotheses advanced by Festinger and his associates²⁰ on the basis of their experiments.

Now what does this mean to psywar?

The power of a group to censure its members is obviously a barrier to deviant action. Whether this is a barrier to be pre-

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

served or attacked depends on whether the group is friendly or unfriendly to the operator's goals.

If the psywar task is to attack the barrier, then the problem is to break down the cohesiveness of the group. This can be done much more easily in a large group where communication is relatively poor than in a small one where communication is good and differences of opinion can readily be talked out. But the principle is the same in either case, that is, to magnify differences and break down communication, emphasizing individual needs at the cost of group needs, and irrelevant issues at the cost of relevant ones. If deviance can be brought about, then more can be done with it if an alternative group is provided for the deviants.

Similarly it is possible to encourage general group frustration by raising doubts about the purpose and goal of the group. The Communists, for a long time, have been asking us why we are fighting in Korea. And whether we should be fighting there.

Another attack is to encourage potential deviants within the group to contrast social reality, as decided upon by the group, with "physical reality" which, in Festinger's terms,³⁰ means the reality that can be tested objectively outside the group. This is what Vishinsky does when he invites American Negroes to compare the American group idea of equality among black and white Americans with the "physical reality" of the situation.

Pluralistic Ignorance. We have already mentioned pluralistic ignorance. It is a condition in which communication has broken down in a group. The members do not know exactly what other members believe or are doing, and each is therefore highly suggestible concerning group uniformity. A situation like this exists in some families where there are a number of young children, all of whom have been taught early in life to believe in Santa Claus. Each one is reluctant to say that he has ceased to believe because he doesn't know how many of the others still believe. Thus some of the children (and both parents) act as though they still believed in the Gentleman from the North Pole for some time after they have realized that he is only a myth. A similar condition existed in this country in the late twenties and thirties, when the great majority of people apparently had ceased to favor prohibition and yet were kept from turning their attitudes into action because they believed that there was almost universal opposition to repealing the Eighteenth Amendment. Once the wets realized how many people were deviant, the illusion of universal support of prohibition disappeared, and the Eighteenth Amendment disappeared soon afterward.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Pluralistic ignorance can operate for a time, therefore, as a barrier to action, or it can be used as a means of channeling action. As you can see, it operates with a kind of band-wagon effect. On one side it can be used to convince potential waverers that they are going against the current, failing to recognize their group obligations. On the other it can be used to create an artificial band wagon. For example, a loyal and conscientious nonhoarder can be scared into action by uncheckable reports that everyone is hoarding and supplies are running low. A potential surrenderer who is told that his friends are surrendering may come over if he can't check the validity of the assertion and prove it untrue. It is important, of course, that these assertions should not be easily contradictable.

One of the best opportunities for playing upon pluralistic ignorance lies in dealing with isolated military units or culture groups. Then the propagandist can step into the broken communication lines and utilize the ignorance for his own ends. He can persuade one group that another has turned against the government. He can persuade one military unit that it can afford to relax and feel secure "like the others."

Summary

This section will serve to remind us that attitude change is not necessarily predictive of action. In fact, action may not confidently be predicted to follow attitude change unless there are also (a) important changes in the personality, (b) actual impending radical changes in the social structuring, or (c) both. The drive strength of the attitude and the possibility of the action receiving group reinforcement are also related to the likelihood of the attitude being translated into action. And it is clear that barriers to action will lessen the likelihood of action following attitude change, just as the existence of channels will facilitate action.

Barriers and channels are therefore two of the important variables the psywar operator will manipulate if he can. Obviously there are some situations in which he will want to erect a barrier to action, and other cases in which he will want to clear a channel for action. Barriers and channels may exist in the form of personality patterns, institutional sanctions, role-status patterns and social norms, informal group censure, and pluralistic ignorance. In each of these areas there are possi-

ORO-T-214

155

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

bilities by which the psywar operator can increase or decrease the likelihood of action by manipulating or making use of barriers or channels, and thus come nearer to being able to control change.

And now let us try to summarize very briefly how psywar works, as we have described it in Part II of this book.

Given a policy, given Intelligence support, given a specified target, and given a directive stating general thematic content and desired results, then the psywar operator proceeds to manipulate such variables as he can command. The chief variable at his command is the message.

He must construct, time, and transmit his message so that, if nothing else, it gets a hearing. He must attract attention for his message in competition with all the other cues being presented to his target.

In the second place he must get his meaning across. This means he must design and present his message in terms of his target's frame of reference.

In the third place he must accomplish a change in the target—an attitude change, preferably also an overt action. To accomplish this he must organize his message or messages so as to (a) arouse personality needs of the target individual and communicate ways of meeting those needs which will be favorable to the operator's side, and do this when the person is in a group situation where the appropriate actions have some possibility of occurring; and (b) make the actions urged or implied in the messages seem important for the target's important current and background groupings, and do this while making the action seem appropriate to personality needs. The process, as you will recognize, is more complicated, but this is the essence of it.

Finally he must do what he can to manipulate barriers and channels so that the action he desires will have the best possible opportunity, and the action he does not desire will have the least possible opportunity, for expression in the target society.

Part III

HOW PSYCHOLOGICAL WARFARE IS USED

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Chapter 5

USES OF PSYCHOLOGICAL WARFARE

Psywar may be used, as was indicated in Part II, to call forth any response which it is in the power of the available target audience to make and within the power of the available symbols and media to stimulate. The range of possible uses is therefore, if not endless, very large.

In practice the range of the uses of psywar is determined by the using nation's goals: political, economic, social, military, ideological, or even religious. Psywar is one of the means by which nations seek to maintain or redistribute power throughout the world. Whatever form or nature psywar assumes, it has always basically the same purpose: one state or society is seeking by means of message warfare to impose its will on a target state or society, to influence the target's policy and actions in a desired direction, to make it weaker and less efficient as an opponent or to make it a stronger or more loyal ally, or a more prosperous and contented friend. In our time, to be sure, psywar, both hostile and friendly, tends to be closely related to the quest for victory over an enemy. But this is best regarded as a reflection of the cold war. In other times we might well use psywar techniques, for example, to strengthen democracy in Uruguay, merely because of our devotion to democracy.

The targets of psywar are consequently groups, and groups that can get things done, call or influence the calling of the tricks, and carry measures out or keep them from being carried out once the tricks have been called. In simplest terms, psywar is directed at one or another of four groups within the target society: those who have the power to make political policy (the political elite), those who have the power, within limits imposed by policy, to plan and execute military missions (the military elite), those who do the fighting (the military population), and those who produce goods and services (the working population). The responses that psywar seeks are usually responses on the part of one or

ORO-T-214

163

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

more of these groups. And because they have to do with whether or how what things get done, they are best thought of as power-relevant, or power-related, responses.

POWER GOALS OF PSYCHOLOGICAL WARFARE

Speier¹ has developed a useful breakdown of psywar objectives. The "will to fight" or the "will to resist" in a modern state, he points out, is really a complex of functions, abilities, and wills, and there are six of these that psywar typically seeks to affect: (1) deciding foreign policy, (2) determination of military missions, (3) ability to govern, (4) ability to command, (5) will to obey, and (6) will to fight.

The power to decide foreign policy rests primarily with the political elite in office, that is, with presidents, prime ministers, congressional and parliamentary majorities, department heads, etc. As it goes about making the decisions, however, the elite is influenced by the staff advice at its disposal (for example, from foreign offices, other government departments, bureaucrats) and, especially as regards the nation's capabilities and the capabilities of its potential enemies and allies, by military advice (chiefs of staff, high-level military committees, etc.). It is also influenced, in varying degrees, by public opinion and pressure groups, including those of the opposition. The influence of opinion and pressure groups varies, more or less in proportion to the degree of democracy the nation has achieved. In a country such as the United States, for example, expressions of support or lack of support from the general public, which must be depended on to fight, work, and pay taxes, and which can turn the elite out of office at the next election, are highly influential in determining policy, and opposition opinion and pressures are carefully heeded. In a country such as the Soviet Union, by contrast, the elite is free to act with much less regard to public opinion (although the extent of its freedom in this regard is often exaggerated in contemporary discussions). Thus psywar, even against a country such as the Soviet Union, has both primary and secondary targets it can aim at in its attempt to influence the deciding of foreign policy. It can appeal directly to the political elite. It can try to influence the elite by rousing public opinion on one side or the other of a current or proposed policy decision. Given the importance of expert staff work in today's complicated world situation, it can try to get at the elite through the elite's key advisers and staff men.

SECURITY **RESTRICTED** INFORMATION

Military missions, though normally imposed by the political elite, are planned and executed by the military elite, that is, the general staffs and other high-ranking officers—plus their advisers. Here also, however, opinion and pressures, including rank and file or even opposition opinion and pressures, play a role: no general staff, even in the Soviet Union, can plan a military operation or, for that matter, military preparations, without giving some thought to mass reactions both within and without its armed forces. In a country such as the United States, for example, prevailing attitudes toward conservation of human life often affect important tactical decisions, which in some other countries might be made on strictly military grounds.

The ability to govern, like the deciding of foreign policy, is a function of the political elite. Unlike foreign policy, however, governing involves a large body of administrative and operational personnel, a considerable number of whom are spread out over the country. Unlike foreign policy, also, it conducts its daily operations in close proximity to and under more or less careful scrutiny by the public. Whereas a change in foreign policy might not have any effect on the general public for months or years, even a slight change in taxes or in the traffic laws will be felt at once. Therefore psywar can affect the public very quickly by affecting the ability of the elite to govern, and, conversely, it can affect the ability to govern through influencing the public. For example, it can undermine the ability to govern by stimulating the growth of a counterelite. In such a republican form of government as ours that would normally mean an opposition party. In a totalitarian state it would mean a secret resistance movement; in a subjugated country, an underground. As another example, it can move to undermine public confidence in the political elite, as by interfering with the efficiency of government or with the communication lines between elite and public. Friendly psywar may seek to do the opposite of these things, such as keep the present elite in power, discourage the counterelite, promote the efficiency of government, or reinforce communications between elite and public. And even hostile psywar might try to keep the target elite in power. As Napoleon said, a blundering leader is a priceless thing—on the side of the enemy.

The ability to command is related to the determining of military missions much as the ability to govern is related to the deciding of foreign policy. Like the ability to govern, it involves a large number of command personnel who come into frequent and close contact with the armed forces. And like the ability to

SECURITY **RESTRICTED** INFORMATION

govern, any change in the ability to command will affect large numbers of fighting men, just as any change in the will of those men to obey will instantly affect the ability to command. Therefore the lines of attack are the same. Anything that can be done to destroy the confidence of men in their leaders, anything that can be done to disrupt communication between commander and troops, anything that can be done to affect the intelligence on which command decisions are made will directly affect, for good or ill, the efficiency of command and the resultant efficiency of the target nation's fighting forces.

In a nation at war, the military elite must be willing to obey the policy of the political elite (in totalitarian countries, of course, these two elites are frequently hard to distinguish, as in the case of Marshal Stalin), the fighting population to obey the commands of the military elite, the working population to obey the orders of the political elite. (For some purposes it is useful to distinguish between the political elite and what we may call the "managerial elite," which stands in the same relation to production as the governing elite to government.) The will of the working population to obey appears chiefly as willingness to work, but also as willingness to reorganize daily lives and endure hardships, dangers, and deprivations. The will of the fighting population to obey represents much more than the will to fight, which we must discuss separately, for in any modern army a large proportion of the troops do not fight. Hence, obedience, that is, willingness to disrupt civilian patterns, to give up civilian rewards, and to endure hardship, danger, and deprivation are all involved. The will to obey, therefore, can be influenced through the elites, through the working population, or through the fighting population. It can be influenced by lessening rank-and-file confidence in leadership, by persuading followers to pursue their own interests rather than those of the state, or by stirring up conflicts of interest in the population and depending on them to take minds off the state's interests.

The will to fight is expected of the entire fighting population, including the military elite. Affecting it is the most direct and immediate way to affect the military potential of a nation at war. This can be accomplished either at the level of command or at the level of the rank and file. It can be accomplished in some cases even through the civilian population, who have power to influence the morale of their men in uniform. Chiefly, however, the opportunities of psywar in this field are those of persuading an enemy to lay down (or not lay down) his arms, building

SECURITY **RESTRICTED** INFORMATION

(or counteracting dissatisfaction, increasing (or cushioning) the psychological impact of weapons, and contributing to the subversion (or stimulating the loyalty) of key personnel. For every army has key personnel; for example, the fortune of modern mechanized armies rides increasingly with their technicians and specialists.

This is the modern view of the field of psywar. As the concept of international conflict has broadened, so has the older, more limited concept of psywar (as a weapon against the will to fight) come to be replaced by a broader one. In these categories of Speier¹ we have a varied spectrum indeed. Here are two decision functions (foreign policy and military missions) by means of which a state chiefly comes into contact with other states; two operational functions (command and governing) by which a state keeps its own house in order, organizes its power, puts into effect its policies; and two basic motivations (the will to obey and the will to fight) which must pervade large segments of the population if any state is to be productive and strong. We have said that the use of psywar is to affect and influence these functions and qualities.

Here are some examples—suggestive, rather than inclusive—of ways in which psywar has been used under each of these six headings.

Deciding Foreign Policy

Supporting Diplomatic Negotiations or Political Objectives. Nations use psywar measures to affect other nations' diplomatic goals and to influence diplomatic negotiations. The Italian elections of 1950, for example, were a major battleground of Communist vs Free World propaganda. On the Communist side there were parades, posters, meetings, broadcasts, and threats and promises from Moscow; on the Free World side there were pretty much the same things, except of course the threats, plus the communication of implied messages via Marshall Plan funds. In an even more spectacular way the San Francisco conference on the Japanese treaty was a psywar battleground. For months before the conference the Communist bloc and the Western bloc maneuvered for support and for headlines. The Communist radio did its best to rouse all the old fears of Japan in the Pacific. Even as late as November 1951 a large segment of Chinese and Korean radio time was devoted to denunciations of the treaty and dire predictions as to its consequences. At the conference itself,

SECURITY **RESTRICTED** INFORMATION

most of the speeches, pictures, and planned events, whatever the immediate occasion for them, were in fact intended not for the delegates but for the psywar target audience, which in this case was world wide. The fact that the conference was televised throughout this country was, whether so planned or not, a psywar measure of great importance from the standpoint of US foreign policy, not because of its influence on opinion within the United States, but because of the dramatic way in which it called the attention of world opinion to the meaning of popular participation in government. Gromyko's dramatic departure from the conference and his news conference after leaving were psywar measures. The dignified and contrite appearance of the Japanese spokesman at the conference was, again, a psywar weapon. The Italian elections and the Japanese peace treaty provide examples of relatively short-term psywar operations intended to affect other nations' impact upon international events. What the United States does by way of strengthening the United Nations as an instrument for peace and the solidarity and friendship of the Western Hemisphere nations illustrates long-term psywar operations of this character. It is hardly necessary to mention that the Soviet Union is engaged in long-term psywar operations on behalf of world revolution and world Communism and against capitalism and genuinely popular government.

Getting Help from Neutral Countries. In any tense world situation the support and cooperation of neutral countries become especially important. In World War II special attention was given Ireland and Sweden because they were neutrals in key geographic positions. Today the Arab states and India are hotly contested targets for the psywar of both the great powers in the cold war. The attitudes at stake in such frays are not necessarily political ones; for example, it might be to the advantage of the United States, and in the interest of world peace, to change the attitudes of certain populations toward farming and fertilizing procedures, so that fewer people will be driven toward aggression or Communism by hunger. And the members of the target audiences are not necessarily dealt with at a distance, even if the target country is far away. America's huge program of student exchanges brings large numbers of students to these shores from important target countries, and the Government has, and tries to exploit, a unique opportunity to influence their attitudes while they are here. It is worth noting, as already intimated, that part of psywar's task in this connection is to counter enemy propaganda to neutral countries.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Strengthening or Weakening Alliances. The pattern of modern warfare is that of alliances. Thus a nation uses psywar on the one hand to urge its allies on to greater efforts, and on the other to weaken unity among enemy alliances. The North Atlantic Treaty Organization (NATO) program is an example of the first, and the Soviet Union's efforts to weaken NATO, by breeding distrust in Europe for America's alleged "aggressive" reasons for starting NATO, are an example of the second. The English-Speaking Union, the campaigns of friendship for France, and the exchange-of-persons program, are examples of the first; the World War II efforts to sow discord between Hitler and Mussolini and the German use of the Katyn massacres to foster distrust between the Soviet Union and Poland are examples of the second.

Preventing or Fostering Aggression. Psywar is also used as a weapon short of war to deter potential aggression or—the other side of the coin—to clear the way for aggression. The Nazi build-ups for the Munich agreement and the invasion of the Sudetenland and the way the Soviet Union prepared the stage for the attack on Finland are clear examples of psywar for aggression. What this country has done in recent years in its attempt to deter the Communist nations from further power grabs illustrates, in the same way, psywar against aggression. America has consistently unmasked Communist intentions in Indo-China, Burma, India, Iran, Egypt, Italy, Yugoslavia, and elsewhere, and warned the Communists themselves of the probable costs of carrying them out. Our actions prior to the Communist invasion of South Korea—our withdrawal from the peninsula, our publication of a map that excluded Korea from the area we would defend, etc.—are examples of failures on the part of this country to use psywar against aggression.

Inducing a Nation to Surrender. Captain Zacharias's broadcasts² to Japan had this purpose. So did America's end-of-the-war messages to Badoglio in Italy.

ZACHARIAS'S DECISIVE BROADCAST

By then peace feelers were coming in to Washington in amazingly large numbers. . . . Admiral Suzuki. . . was more than willing to heed the Emperor's desire to bring about peace—but his loyalty to the Emperor made him refrain from doing anything about it until he could ascertain what the Allies had in mind regarding the future fate of the imperial house. In his plight he decided upon what in retrospect appears to have been a desperate move. In June he instructed Mr. Sato, the Japanese ambassador to the Kremlin, to make representations to Marshal Stalin and ask him to intervene with the Western Allies on Japan's behalf in order to obtain a further clarification of the unconditional surrender formula, and, if possible, peace terms. What he really

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

wanted was an assurance that Japan's sovereignty would be respected even if she had to pay for the privilege with her empire.

The fact that such a peace plea had been forwarded to Stalin and Japan's plight bared to the Soviet leaders did not receive here the attention it seemed to warrant. The Soviet Union by Suzuki's move was given a clear indication of Japan's inner plight and her willingness to surrender. Thus when on August 8, 1945, the Russians joined in the war against Japan, they acted upon intelligence provided by the Japanese themselves that they were at the end of their rope. Russia joined in the war in the knowledge that Japan had admitted defeat. . . . By the end of June the plight of the Japanese had become desperate, and an Admiral Suzuki received no answer to his plea from Russia, he called an extraordinary session of the Diet in which he discussed in remarkably frank terms the entire war situation.

We recognized the significance of this move and gathered around the ticker bringing to our office the momentous speech. It was evident from the very outset that while Suzuki was talking of war, he was thinking of peace. Now, it was no longer a material consideration such as the retention of Manchuria or Korea which prevented him from saying in so many words that he would accept our terms. The only doubt which still forestalled a decision was the future status of the Emperor. "I have served His Imperial Majesty over a period of many years," Suzuki said, "and I am deeply impressed with this honor. As bold as it may seem, I firmly believe there is no one in the entire world who is more deeply concerned with world peace and the welfare of mankind than His Imperial Majesty the Emperor. The brutal and inhuman acts of both America and England are aimed to make it impossible for us to follow our national policy as proclaimed by the Emperor Meiji. I hear that the enemy is boasting of his demand of unconditional surrender by Japan. Unconditional surrender will only mean that our national structure and our people will be destroyed. Against such boastful talk there is only one measure we must take—that is to fight to the last."

With our knowledge of the background of this extraordinary session and of Suzuki's speech, I made an important broadcast to the Japanese on July 7 inviting them to ask openly for peace. "Japan must make the next move," I said in clearly accentuated words. "Japan must make her choice without delay, for reasons which Admiral Suzuki knows. I have told you before that the time is running out for Japan. You must move and move quickly. Tomorrow it may be too late."

We analyzed the speech again for future action, and as subsequently proven by events and confirmed by Suzuki himself, our analysis was accurate. Our problem now was the method by which we could reassure Suzuki on this score, and indicate that there was no decision to destroy what he ambiguously described as the national structure of Japan.

This time our answer was not confined to another broadcast. Instead, there was selected a method as devious as those chosen by the Japanese themselves. We decided to answer Premier Suzuki in an anonymous letter written to a reputable American newspaper and to bring this letter to his attention in the quickest manner possible. *The Washington Post* was selected as the vehicle with full cooperation of its editors. The letter contained all the answers to Suzuki's query. . . . The letter attracted considerable attention in the United States, and the *Washington Post* was bombarded by callers who wanted to learn the identity of its anonymous author. My telephone also rang. Washington correspondents, accurately gauging the technique, tried to make me confess authorship. . . . The letter was reprinted in many American dailies from coast to coast. We felt certain that it would be picked up in Washington by the listening posts of the Japanese government.

Simultaneously another broadside was prepared along more conventional lines. I was now called upon to prepare a radio script on the highest

SECURITY **RESTRICTED** INFORMATION

diplomatic level. I fully recognized my tremendous responsibility and devoted special attention to this one talk. We worked on the script day and night for almost a week, drafting and redrafting it, listening to suggestions, submitting it for approval, weighing every single word with the greatest of care. When at last I went to the broadcasting studio, I had its fourteenth draft in my pocket.

For this broadcast we selected a little room specially built for highly classified recording to guarantee security. As unobtrusively as possible, guards were posted around the studio to see that no unauthorized person could obtain advance information of what I was to say. But this secrecy was maintained for only a short period. When my recordings were put on the air a few days later, the text of the broadcast was released to the American press by the OWI, using this publicity as another means of reinforcing and emphasizing the message.

I was introduced as "an official spokesman of the United States government," in line with the stipulation of the operation plan. But the Japanese had indicated doubt as to my true authority. Was I "official spokesman" in fact, as well as in name? Did my statements carry higher endorsement? Or was I merely a cog in the wheel of the American propaganda mill? With the release to the press we hoped to dispel their doubts, and the reception which the American newspapers accorded to this talk surpassed our most optimistic expectations. The news of this broadcast broke on July 21, and the evening papers were the first to feature it. "U. S. Warns Japan to Quit Now, Escape Virtual Destruction," headlined the *Washington Post*, and next morning the *New York Times* gave it front-page display and reprinted the whole broadcast. Other prominent papers similarly featured it.

The broadcast reiterated the themes of my letter to the *Post*. The message it carried was incorporated in four sentences: "The leaders of Japan have been entrusted with the salvation and not the destruction of Japan. As I have said before, the Japanese leaders face two alternatives. One is the virtual destruction of Japan followed by a dictated peace. The other is unconditional surrender with its attendant benefits as laid down by the Atlantic Charter." The urgency of the situation was formulated in words which were adapted to Japanese psychology when I said: "Your opportunity to think over these facts is rapidly passing. . . . If the Japanese leaders still prefer to delay and hope for miracles, they should remember that the cemetery of history is crowded with the graves of nations—nations which were doomed to extinction because they made their decision too late."

In the midst of the domestic clamor which was manifested in editorials printed in virtually every American daily, the Japanese kept a significant silence. As I waited for their answer, I visualized the conclaves going on in Tokyo, in which possible strategy and tactics were being discussed in an endeavor to find the most propitious answer. As it was, we did not have to wait long. The Japanese answer was delivered at 12:15 A.M. (EWT) on July 21, by another Inouye, Dr. Kiyoshi Inouye this time, who was introduced as Japan's outstanding authority on international relations. I remembered him quite well as a former professor at the University of Southern California, at Tokyo University, and as delegate to various international conferences.

The message entrusted to Dr. Kiyoshi Inouye was of momentous importance. In effect, he was to indicate Japan's willingness to surrender unconditionally, if and when Japan was assured that the Atlantic Charter would apply to her. He stated: "Should America show any sincerity of putting into practice what she preaches, as for instance in the Atlantic Charter excepting its punitive clause, the Japanese nation, in fact the Japanese military, would automatically, if not willingly follow in the stopping of the conflict. Then and then only will sabers cease to rattle both in the East and the West."

SECURITY **RESTRICTED** INFORMATION

This was not the final word of the campaign. But it was the next to last. In retrospect, the Inouye broadcast of July 24 must be accepted as evidence of the Japanese decision to terminate the war then and there; to terminate it on the basis of the terms outlined in my series of previous broadcasts culminating in my twelfth talk. The Japanese answer was delivered on the eve of the Potsdam Declaration in which the meaning of unconditional surrender was clearly outlined and spelled out. It was delivered thirteen days before the first atomic bomb was dropped on Hiroshima, and more than two weeks before the Soviet's entry into the war. Japan was ready for surrender. To reap our harvest we had only to shake her like a tree full of ripe apples.

Subsequent investigations on the spot after Japan's surrender revealed that the Emperor was fully aware of our psywar activities and had access to the monitoring service. He felt that we understood clearly the situation inside Japan and that at the end of June 1945 the time had come to seek peace.

Several Japanese in high positions who were in constant touch with the Emperor were thoroughly interrogated. One official of the Foreign Office said: "The Zacharias broadcasts were influential especially in government circles," and added, "The outstanding feature of the Zacharias broadcasts was the difference between unconditional surrender and dictated peace. The Japanese knew how Germany was being administered under such a peace. Zacharias promised that if Japan accepted unconditional surrender they would have the benefit of the Atlantic Charter. The people began to look with favor on such terms, claiming that it was not what the militarists had said. It seemed to the people that Zacharias's explanation of unconditional surrender offered a way out."

Mr. Toshio Shintori read the copies of my broadcasts at the Foreign office. At first he was somewhat skeptical, then became a thorough believer. A copy of each broadcast was taken to the Emperor by Mr. Matsuda. He stated that the information in these talks influenced those in the Emperor's circle as well as the Emperor himself.*

Determination of Military Missions

Design of Enemy Strategy and Tactics. The typical instance of psywar against an enemy military elite is the message intended to influence its strategic or tactical decisions. A common objective here is to influence his timetable—to induce him to do such and such (make an attack, commit a reserve regiment) earlier or later than he would have in the absence of the message. An example of this kind of thing is the campaign in World War II that centered around the taunting question, "Where is the Luftwaffe?" This was undoubtedly of some influence in leading Goering to send up the fighters he was saving for later and critical battles, and to send them up at a time when the odds were against them. Or, leaving time to one side, psywar might try to induce the target to do X in preference to Y, X being something it would presumably have avoided but for the message.

*Reprinted by permission of author and publisher.

SECURITY **RESTRICTED** INFORMATION

The United States, at the present time, for example, would of course like to slow down the pace of Soviet rearmament and is presumably saying things over VOA that, if effective, would move the Soviet Union in that direction and thus influence its strategy.

Speier¹ expresses doubts that psywar by itself can do much by way of surprising or deceiving the enemy in a combat situation. The point, presumably, is that tactical decisions are made and tactical expectations formulated by taking into account only what the enemy commander learns from his intelligence and his (and his patrols') observations but not messages from the other side. That, of course, is perfectly true. Goebbels went to great length in June of 1941, for example, to create through psywar the impression that Germany was going to invade England. An article in the Volkische Beobachter described what had happened in Crete as a rehearsal for a great airborne invasion. A "leak" occurred. The censors ostentatiously clamped down on outgoing dispatches dealing with the matter. From first to last, however, it was known to the military in Britain, and to the newspapers, as well, that more than 100 German divisions were massed on the Soviet border. These divisions naturally spoke louder by far than Goebbels's words.

Enhancing Military Deception. This is not to say, however, that psywar cannot be used successfully for purposes of surprise. Certainly it is not to say that surprise and deception measures cannot be strengthened with psywar support. It might indeed be argued that all deception is psywar. We could not, on that showing, speak of psywar "support" for a deception measure; the correct distinction would be between deception psywar and propaganda support for it. When psywar is combined with other evidence—for example, when materiel is deployed as a hoax, as in the preparations for McNair's "army" at the time of the Normandy invasion—it can surely increase the likelihood of successful military deception. Often, moreover, the enemy commander has no intelligence he can rely on: if our Air Force drops leaflets on civilians in area A, advising them that they are about to be bombed and should flee, the enemy G-3 would be foolish to take it absolutely for granted that the real bombing raid would be elsewhere; that is, he must take precautions. If the leaflets do turn out to have been a deception measure, he will have wasted his energies and will be taken by surprise where the raid actually does occur.

SECURITY **RESTRICTED** INFORMATION

Affecting Will of Command. Psywar has been used many times in an attempt to reduce or increase the will of military command to begin or continue fighting. Goering's display of German air power to Lindbergh and other visitors was obviously an attempt to reach military commanders through these representatives. He wanted to discourage the military elite of other countries from giving warlike advice to their political elite.

In a different sense, psywar has been used to persuade enemy commanders to surrender their units. Sometimes such measures have succeeded (some of the variables that affect success or failure have been discussed by Herz and others). One or two principles seem to emerge from America's experience with them, in France, Germany, and the Pacific islands. For one thing, psywar is not likely to bring an enemy unit over unless the latter's military situation is pretty bad. Again, an ultimatum is less often effective than an approach that saves the commander's face by appealing to his reasonableness and consideration for his charges in the face of a hopeless tactical situation.

Arousing Public Opinion or Political Pressures. The Soviet peace balloon of 1951 illustrates a further use of psywar to influence military planning. At that time it was unquestionably to the advantage of the Communists to get our "killer offensive" called off in favor of truce talks. Therefore the campaign was planned to take full advantage of our wish for peace. As another example, before the Soviet Union got the A-bomb there was a widespread Communist campaign to rouse substantial segments of public opinion against the use of atomic weapons.

Ability to Govern

Interference with Control Systems or Communications. The illustrations that come most readily to mind here have to do with psywar operations against Communist states, where close control over and surveillance of the general population are the major instruments the government uses in imposing its will. If its capacity to exercise control and surveillance can be weakened, therefore, the door will be thrown open to a great many psywar measures that would otherwise be pointless. When Radio Free Europe broadcasts the names of Communist informers in East Germany, what it is really attacking is the Communist control and surveillance system. The communication systems of Communist states are targets of great importance for this very reason. Anything that can be done to interfere with communication between political

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

leaders and followers will obviously lessen the former's control and also encourage suspicion and frustration. It is not often possible to attack communication lines with wire cutters or any other physical means. But psywar can accomplish some of the same ends by starting rumors, inserting false information in the communication channels, or encouraging withdrawal and other troublesome types of behavior on the part of the general population.

Helping Build Counterelites. The oldest technique of attack on government is the building up of counterelites. This has been the Communist technique throughout all the present Soviet orbit and also throughout the countries which are marked but not taken. The Soviet Union, for example, gave propaganda and organizational support to Mao in China for a long while before he came to power. Its support of the Communist movements in France, Italy, Egypt, Iran, Burma, and Indo-China are examples of presently continuing operations aimed at the overthrow of the governments of target countries. Conversely, much of the surveillance in the Soviet states is aimed at making sure that no counterelite shall ever raise its head. It is therefore not easy for an outside country to give support and encouragement to opposition groups, particularly those behind the Curtain. Indeed, any overt encouragement given to such a group would at once reveal its existence to the control and surveillance officials and result in hurting it.

Strengthening Friendly Leaders and Weakening Enemy Ones. One purpose of psywar in the area of governing is always to strengthen friendly leaders and weaken enemy leaders. Our psywar policy in World War II was, as a matter of course, to build up confidence in the allied leaders, especially FDR and Churchill, and wear down confidence in Hitler and other enemy leaders. The Communists have always given vigorous psywar support to their chosen leaders, such as Mao in China, Kim Il Sung in Korea, and, in other days, of course, Tito in Yugoslavia.

Supporting Resistance and Gaining Support. Another use of psywar that assumed great importance in the last war was the strengthening of resistance among subjugated peoples. The US support, logistic and propaganda, given to, for example, the French underground and the Philippine resistance between 1941 and 1944 are examples of this psywar objective. As soon as we moved back into the countries in question, psywar took on another assignment—that of winning and keeping friends and supporters among the liberated populations. Later psywar had the same task to perform in Germany and Japan.

ORO-T-214

175

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONThe Ability to Command

Producing Dissension in Enemy Military Forces. One of the commonest psywar missions is that of producing cleavages in the ranks of the enemy forces. In Korea the Communists have tried to foment mutual suspicion and dislike between the ROK troops and the American troops, and between American and British Commonwealth troops. America, for its part, has tried to encourage distrust between Chinese and North Koreans, between military and cultural officers, and between cultural officers and their charges. A familiar theme for this purpose is the idea that group A is carrying the brunt of the fighting, while group B is having it easy. The real purpose of such propaganda, of course, is to make things difficult for the enemy command, by countering its effort to work its units together like a team.

Strengthening Friendly Leaders and Weakening Enemy Ones. In military as in civilian affairs a continuing objective is to strengthen friendly leaders and weaken enemy ones. That is one of the reasons why this country has given medals, recognition, and publicity to the leaders of its allies in the Korean war. Of this same general character is propaganda designed to call attention to ruthless use of troops and playing of favorites on the part of enemy commanders.

Misleading Enemy Intelligence and Disrupting Communications. Every army, of course, tries to see that its opponents get false intelligence and erroneous information on which to estimate capabilities and intentions. Psywar's easiest opportunities for doing this come when an enemy unit is isolated or disorganized, since psywar can then plant false information about unit locations or the battle situation or even give the unit spurious orders purporting to come from its own command, without normal interference by the enemy's communication network. Here, however, we must repeat our word of caution on military deception in general: a field commander will always trust his own intelligence and observation reports rather than enemy psywar.

Supporting Military Government. Military government needs and uses psywar to support its programs. American military governments in both Germany and Japan made broad and continued use of psywar of many kinds—broadcasts, posters, printed materials, films, meetings, demonstrations, libraries, schools, exchange of persons—and found them very helpful.

Eliciting Information of Military Value. Psywar is used by military commands for "fishing." By broadcasting assertions or

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

asking well-chosen questions it is sometimes possible to force the enemy to reveal (or trick or inveigle him into revealing) the true location of a unit or the economic statistic sorely needed for planning purposes—or, more important still, the premises and expectations on which he is acting. The development of what is called "content analysis," by which it is possible to learn things from the enemy's propaganda that he does not intend to reveal, has enormously increased the potentialities of fishing expeditions and made them easier to bring off.

Will to Obey

Creating Difficulties between Military and Political Elites.
Cleavage between military and political elites is perhaps more prevalent and easier to encourage than is generally realized. Gorlitz says that out of a total of 36 lieutenant generals in the German army, 21 were dismissed by Hitler, 2 were expelled from the army, and 3 were executed. Out of 800 officers of the German general staff, 150 are believed to have lost their lives as opponents of the regime. Russian purges, as is well known, have frequently struck hard in army circles. In 1941, indeed, many people believed that the purges had seriously weakened Russia's Army.

Disrupting Communication between Leader and Followers.
Anything that can be done to keep the needs of followers from being communicated to leaders, and the orders and explanations of leaders from being communicated to followers, will result in disorganization and, at the margin, in suspicion and distrust. Psywar can seldom hope to accomplish this kind of thing by striking at the communication channels themselves, but the communications can be virtually disrupted by affecting what goes into the channels or by influencing attitudes toward what emerges from them. If, for example, psywar can convince the followers that their needs will not be heeded by the leaders even if communicated to them, it will to all intents and purposes have interrupted communication in that direction. If, similarly, it can undermine the followers' confidence in the explanations handed down by the leaders, the effect is again much the same as would be achieved by blocking off the channel. An example of striking at the channels themselves by psywar would be propaganda calling upon literates in a country with a high incidence of illiteracy not to serve as secondary communicators for official orders.

SECURITY **RESTRICTED** INFORMATION

Undermining Confidence in Leadership and War Aims. This is one of the commonest aims of psywar operations. One of the chief objectives of recent Communist psywar has been to wear down confidence in leaders and war aims among the populations of the United Nations fighting in Korea. In World War II, Goebbels struck again and again at Roosevelt and Churchill in a vain attempt to persuade Englishmen and Americans that they lacked military judgment and political acumen. We have already discussed the difficulties in the way of direct attacks on such totalitarian leaders as Hitler and Stalin. The democracies are undoubtedly more open to this kind of psywar measure than their enemies.

Reducing or Increasing the Incentive to Work. Nations at war usually provide some sort of incentive program for industrial workers. In Communist Korea the workers were persuaded to give many hours of free overtime labor in honor of special causes and occasions—for example, Kim Il Sung's birthday, Stalin's birthday, the success of the People's Army, etc. Therefore UN psywar had the task of trying to persuade the North Korean workers that they were being misused and should work less hard, and the farmers that they should withhold some of their crops from the Communist collectors.

Willingness to Sacrifice and Face Danger. Work is not all that is expected of a nation's population in wartime. It must also make sacrifices, and psywar is often used to reduce (the enemies') or increase (the friends') willingness to give up things that they value in order to help the war effort. Such propaganda is the psywar equivalent of the domestic "blood, sweat, tears, and toil" program with which Churchill appealed to the iron in the British temperament. Examples are the broadcasts of "Annie" to the Germans and Tokyo Rose to the Americans in the Pacific, the purpose of which was to make the listeners nostalgic, remind them of the things they were giving up, and reduce their willingness to do without those things any longer.

A people at war must also be willing to face bombing raids and other types of physical danger. Psywar, if it can get through to them from outside, can play upon their anxiety, counteract domestic efforts to minimize the dangers, plant questions and doubts as to whether further sacrifices are worth making, and encourage people to attribute their hardships to the government's incompetence, negligence, or lack of foresight. If it succeeds in evoking the desired attitudes, the effect will be to reduce people's

SECURITY **RESTRICTED** INFORMATION

willingness to carry on and, in all likelihood, to reduce the effectiveness of the government's civilian defense program.

Causing Panic. Psywar is sometimes used, usually in connection with military operations, in the attempt to create panic. The Germans did this in France in 1940, with the result that panic-stricken French people, many of them men and women without whom public utilities and other necessary services could not operate, poured out of the cities, blocked traffic on the highways, and created overnight vast refugee problems. The Chinese, when they used fireworks and bugles before their attacks in Korea, were employing a centuries-old psywar device for inducing panic in the enemy's army.

Feelings of Discrimination and Unfair Treatment. Both in armies and in civilian populations there are sure to be individuals who can be brought to feel—correctly or incorrectly—that they are getting a raw deal. This is an open door for psywar. For example, casualties and dangerous assignments are inevitably distributed unevenly among fighting forces. About 70 percent of American casualties in World War II were among the infantry, which accounted for no more than 10 percent of American armed forces. It is psywar's business to call attention to such apparent inequities, especially if the unevenness can plausibly be linked to alleged favoritism on the part of the enemy leaders, or to their class, national, or ethnic loyalties. Among the working population of the target country, similarly, it is easy to show that some groups are doing better out of the war than others, that some are being worked harder than others, etc. Rationing systems, and no country can now fight a war without one, offer psywar similar opportunities for making people aware of grievances that they might otherwise overlook. Rationing causes ill feeling even if the rationers have the best and most equitable intentions—if for no other reason than because they cannot take the individual case into account. And normal western standards of fair play give psywar the rationalization people need in order to justify their resentment of the system.

Encouraging Minority Groups. Much of the propaganda directed at the Austro-Hungarian empire in World War I was intended to bring about a majority-minority cleavage between its two components. Russian propaganda to the United States now tries to set Negro against white, Puerto Rican against continental American, Filipino against American. In Japan the Communists are today making skillful use of a Korean minority, which has already assumed an importance quite out of proportion to its numbers.

SECURITY **RESTRICTED** INFORMATION

Contributing to Subversion of Key Personnel. Key personnel such as engineers, top scientists, top pilots, and commanders are targets that psywar dares not neglect in modern warfare. Churchill testifies that the elimination of three expert German submarine commanders in 1941 made a substantial difference in the war at sea. The subversion of Klaus Fuchs, the British atomic scientist, which was apparently accomplished without any coercion whatsoever, may turn out to have been more important to the Russians than the winning of a great battle. And undoubtedly the Russian pilots who have defected in recent years by flying their planes outside the Iron Curtain have dealt blows to the Communist regime out of all proportion to the value of the planes or the need for their individual skills. Key men, simply because they are key men, set an example that is likely to be imitated on lower echelons; they are, again merely in virtue of being key men, in the know and have valuable information to impart to the enemy. Therefore the command setup that cannot keep them in line and count on their loyalty is heading for trouble and, what is equally important, knows it is heading for trouble and must take corrective action that is sure to prove costly. Indeed, one of the major purposes of this type of propaganda is to give command the jitters and cause it, perhaps unnecessarily, to increase security precautions.

Will to Fight

Encouraging Surrender and Reducing Last-ditch Resistance. The typical form of surrender-mission psywar is the surrender pass, which has been dropped by the hundreds of millions in World War II and the Korean operation (see also the next section, Submission). It is the commonest form of military psywar and has been much written about. Reducing last-ditch resistance is merely a special form of surrender-mission psywar. Brick and stone cities, jungles, mountains, etc. are hard to clear of enemy troops, even after they are beaten militarily; often they can be mopped up only at great cost, so that the military places a high value on measures calculated to persuade isolated pockets of enemy troops to give up. The caves of Okinawa, the mountains of Korea, and the city of Stalingrad all testify to the success of such measures. And, as has been mentioned above, it is often possible to deal with the enemy commander and arrange the surrender of an entire unit.

Figures 4 and 5 are enemy psywar leaflets dropped by the Chinese Communist Forces among UN troops. Figure 4 is not

SECURITY **RESTRICTED** INFORMATION**HELLO DEAREST FAMILY:**

... I am alive and well. And someday when this foolish war is over I will be returning to my loved ones. All this war over here has caused is heartache and sorrow. I don't think that we ever had any business over here. And I think we should withdraw all foreign troops out of Korea and let the Koreans themselves decide what kind of government they want. For after all, this is their country, not ours.

Now, mother, I know you and Dad are worried about me for you have read about the Korean People's Army and the Chinese Volunteer Forces killing war prisoners. Well, don't believe this. They take good care of us and keep us healthy so we can return home. I am disgusted with war and want no more of it. I only want to return home and lead a peaceful and happy life. The big shots that sent us to war don't have to suffer. It is us little men that suffer.

How is my sweet daughter? I dream of her and my other loved ones every night. It is pitiful to see these people homeless and destitute over here. It has sure woke me up to the fact that war and warmongers are enemies of all people.

Don't worry about me. I am in good health and some sweet day I will be home and what a wonderful time that will be. I love you dearly.

(signed) Just Ken.

From Sergeant Otto K. Thomas 38003871 to Mr. and Mrs. G. F. Thomas of Box 23, Somerton, Arizona dated February 11, 1951.

Obverse

Fig. 5—Chinese Communist Surrender-Mission and Distrust-of-War-Aims Leaflet

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

only a surrender-mission leaflet but also attempts to arouse feelings of privatization, unfair treatment, and distrust of war aims.

Inducing a Sense of Unfair Treatment. A sense of being unfairly treated can be created in troops as well as in civilians. Troops can be made less willing to face casualties or deprivations, and encouraged to privatize, withdraw into daydreams, or regress into more childlike behavior. This is the purpose of much psywar addressed to tactical units. Where it is successful, it results in a notable reduction of the enemy's will to fight. Figure 5 subordinates the surrender-mission theme to the unfair-treatment and distrust-of-war-aims themes.

Increasing the Impact of Weapons. Armies have experimented with ways of using psywar to increase the tension and shock of military operations. Some variety of warning has been the usual pattern. The German blitzkrieg built up fears long before any bullets came, and there is good reason to believe the fears then made the bullets more effective. A common tactic in strategic bombing is to warn a group of cities that one of them will be bombed, in the hope of disrupting activities in all of them. Another experiment has been the use of successively stepped-up bombardments, always with the warning that the real bombardment is yet to come.

A promising new development in thinking about psywar has to do with taking account of the psychological effect of weapons in deciding what weapon to use in achieving a given tactical purpose (for example, artillery vs. air-dropped napalm). This we might call using psywar to increase the impact of the weapons system.

Contributing to Subversion of Key Personnel. We have mentioned the subversion of key personnel in connection with the ability to command. What we said about it in that connection is, however, equally relevant here, since the reason that propaganda to subvert key personnel is a good way of striking at ability to command is, in large part, derivative from its being a good way to strike at the will to fight. Such personnel are, for the most part, technicians and extremely necessary to smooth operation of the military machine. In America's Asian campaign great responsibility has rested on interpreters. Intelligence personnel has become increasingly important as warfare has speeded up and extended its scope. Communications personnel can sway the tide of battle by performing their functions badly. Thus, purely aside from what the subversion of key personnel does to the ability to command, it cuts down fighting efficiency. And an army

SECURITY **RESTRICTED** INFORMATION

that knows it is not fighting efficiently speedily loses its will to fight.

CHIEF RESPONSES SOUGHT BY PSYCHOLOGICAL WARFARE

Another way to look at the uses of psywar is in terms of the chief responses it seeks from its target audiences. It is customary to say that psywar, in different forms and different situations, may be used to bring about submission, subversion, confusion, cooperation, privatization, or panic. Let us say a word about each of these, reminding ourselves, to begin with, that under our broad definition of psywar we are interested not only in these responses but in their opposites as well, and not only in how to achieve these responses but also in how to prevent someone else from achieving them.

Submission

As mentioned in the preceding section, Will to Fight, most tactical psywar has this response as its goal, because most tactical psywar is surrender-mission psywar. And surrender-mission tactical psywar is, or at least has been until now, the commonest form of psywar with submission as its goal. Other forms, of which we may have more experience in the future, would be propaganda looking to submission on the part of an entire country or on the part of the rural population of a country in which we had occupied only the cities and the arterials.

The tactical psywar officer must do more than convince his enemy of the futility of continued resistance; he must make the life of a prisoner of war sound as attractive as possible; he must clearly explain the procedure for surrendering and make it sound as easy and safe as possible. It is now common psywar practice to saturate the enemy lines at times with surrender leaflets (Figs. 6 and 7), which usually contain detailed instructions to "throw away your weapon, and come in with your hands clasped behind your head," and an official pass signed by the theater commander. [The World War II form of this pass read: "The German soldier who carries this safe conduct is using it as a sign of his genuine wish to give himself up. He is to be disarmed, to be well looked after, to receive food and medical attention as required, and to be removed from the danger zone as soon as possible. Dwight D. Eisenhower, Supreme Commander, Allied Expeditionary

tactical situation, or else loudspeakers (on the ground or airborne) are used to speak directly to the enemy, thus adding the persuasive appeal of the human voice to the arguments of the leaflets."

The Capture of Willingen

An opportunity to observe the battle conditions under which propaganda appeals for group surrender are able to succeed was presented by a loudspeaker address to the German troops defending the town of Willingen, situated six miles south of Trier on the Saar River. This Sykewar mission was able to issue precise instructions, completely coordinated with artillery and infantry fire, so as to convert the defeatist predispositions of most of the garrison into a successful group surrender.

Willingen is situated in a valley of the Saar River and is traversed by a north-south railroad. A US infantry battalion was approaching the town from the south as part of the coordinated attack northward toward Trier. Armored elements had already outflanked Willingen on the southeast and were well on their way to penetrating into Trier. Earlier in the morning of the attack, elements of a tank destroyer battalion, located across the river on the high ground of the valley's western slope, had been engaged in reducing pillboxes lining the river and the railroad in preparation for the infantry assault. The German garrison was composed of a security battalion, which had been stationed in the town for about three months, as well as elements of a German infantry division which had been retiring northward toward Trier under American pressure. These troops were in a hopeless tactical situation but still in a position to delay the American drive. It was therefore decided to issue a loudspeaker appeal to these troops before launching the infantry assault.

The loudspeaker apparatus was installed on the high ground of the west slope of the valley, near the American tank destroyers. The tank destroyer fire against the pillboxes was interrupted and instructions in English were issued over the loudspeaker to the American infantry unit. They were told to hold their fire for a period of five minutes since an appeal to surrender was about to be issued to the German force in the village. The lull in the firing was necessary to enable enemy troops to hear the message and to ensure them an opportunity to surrender.

The broadcast to the German troops was simple and largely in the form of an order to surrender or be destroyed. They were informed that their position was hopeless owing to their encirclement by American armored units, supported by artillery and infantry units on the other edges of the town. They were given five minutes in which to throw away their weapons, leave their positions, and move southward along the railroad track toward the American infantry positions. After each minute the directions to leave the town or be destroyed were repeated. At the end of the third minute, a white flag appeared over one of the main bunkers, and a small group of men left their positions and walked southward. Soon other units within the town began to do likewise. Some soldiers, perhaps confused, began to leave the town in a northward direction, that is, toward the main German positions. The surrender instructions were again repeated by the loudspeaker, addressed particularly to those soldiers moving northward. This second message caused nearly all of them to change their direction as instructed. However, two men intent on escaping from the town continued northward. Artillery fire from a tank destroyer eliminated these two, who had not been impressed by paywar. This incident provided copy for an additional loudspeaker broadcast, which was made immediately.

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

pointing out the uselessness of further resistance. An immediate response was additional surrenders from positions along the hillside outside the town and in a second, smaller village further to the east, which was still completely in the enemy's hands.

Thereupon the American infantry commander, using the loudspeaker, ordered his troops in the valley to move in and take over the town, which was surrendering. It also became necessary to issue directions to the remnants of the town's civilian population who, as could be seen from the hillside, were becoming alarmed and were attempting either to show their neutrality by waving white flags or to surrender with German soldiers. Since the American commander did not wish to be encumbered by civilian movements along the road, an order was issued to the population to assemble in the town's main church. The order was scrupulously obeyed and the civilian population remained there until the MG officer arrived later in the day. When he arrived, he found them still conveniently assembled and was able to issue curfew regulations and other instructions to them.

The basis for success of the mission was the perfect coordination between fire and appeal. Interrogation of many POWs captured during the operation indicated that their defeatism was pronounced. An overwhelming majority had seen our leaflets pointing out the strategical hopelessness of Germany's military position. Most had been demoralized by the Allied pressure during the last few days, which had forced them into the town. A further sense of hopelessness developed early that morning, according to some POWs, when most of their commissioned officers withdrew.

Despite such a level of defeatism and even loosening of command, mass surrender was physically impossible as long as pressure was being placed on the town. Interrogations revealed that the security battalion stationed in the town had frequently discussed their plans to surrender once the American troops arrived at the outskirts of the town. But when the troops actually came on the scene, no one seemed willing, or knew how to face the physical dangers of bringing about such a surrender. As soon as an opportunity to surrender, and direct instructions on how to do so, were presented, the overwhelming majority of troops complied. Others in the town seemed to be swept along with the tide.

Loudspeakers have also proved highly effective against isolated enemy units ("pockets") and against enemy troops or guerrillas who have taken refuge in forests, underbrush, caves, etc. For example, they were sometimes used with spectacular success to accomplish the surrender of Japanese troops holed up on conquered or bypassed Pacific islands.

Subversion

As submission is the chief goal of tactical psywar, subversion is the usual goal of strategic psywar. By subversion in this sense we do not refer only to the spectacular cloak and dagger activities of paid agents. We mean any activity that is contrary to the best interests of the state, most particularly to the conduct of its war effort. The psywar operator's favorite instrument for encouraging such activity on the part of civilians behind the

SECURITY **RESTRICTED** INFORMATION

battle lines is propaganda calculated to evoke mutual suspicion, dissatisfaction, and resentment. The theory underlying such propaganda is that if it is successful some civilians will obey orders less quickly and work less hard. They will write lonely, depressed letters to their sons in the army. They will stay home from the factory oftener or contribute less freely to war loans or cheat when they turn in their crops for state use. They will help spread rumors against the political leaders. A few—a very few at best—will perhaps become so bitter in opposition to the policy of their leaders that they will resort to spying, sabotage, or assassination. But these few can be very useful, especially in the later stages of the war; it is they who will work with this country's agents when they can be gotten in. The major function of subversion propaganda, in other words, is to start people down the road that leads to actual cooperation with the United States.

In a country at war, subversion takes a form anywhere along the continuum from dissatisfaction to violent revolution. In Germany during World War II it ran the gamut from jokes about the Nazis to the plot to murder Hitler. In occupied France it ran all the way from insults chalked on the walls to the guerrilla activities of the maquis. In occupied South Korea it went from the human chains that passed news to the organized sabotage that kept telephone lines out of repair. This is the complex of responses that the strategic psywar operator tries to evoke with subversion propaganda.

The general population is not likely to be drawn into subversive activities. Thus the psywar operator is on the lookout for specific groups that have reason to be disaffected or which have the organization and, above all, the opportunity for subversion. By working with and through such groups, instead of trying to subvert the whole population, he will at the same time protect his friends and avoid the risk of antagonizing large numbers of people and so increase their "will to obey."

Confusion

Confusion is one of the oldest and most common of psywar goals, and any type of psywar, whether tactical, strategic, or political, may have the task of achieving it as part of its mission.

When a boxer famed for his lasting power feigns weariness early in a fight, part of his purpose is to leave his opponent wondering whether he is really weary or merely setting a trap,

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

that is, to confuse him. The same thing is true of the army commander who puts his troops through motions evidently calculated to cause his opponent to expect an attack at a point in the line at which he does not intend to attack at all, and of the strategic psywar operator who pyramids the threat of a bombing attack into a work stoppage in 12 enemy cities. As all these examples show, confusion-producing psywar often has in it an element of deception. More precisely, it often confronts the target with a choice between assuming that an attempt is being made to deceive it, assuming the contrary, or recognizing that it does not know what to expect. But not all psywar measures intended to confuse are of this character. When Litvinov was removed as Commissar of Foreign Affairs it really did mean that the Soviet Union was adopting a new, anticollective-security foreign policy. But its immediate effect, no doubt intended by Soviet political warriors, was to leave other countries guessing and thus throw them diplomatically off balance. Some observers believe that many of the most dramatic Soviet démarchés in foreign affairs have as their main purpose the sowing of confusion—confusion for its own sake—in foreign chancelleries. The proposal for peace negotiations in Korea many months ago may, for example, have been of this character. The democracies apparently do not play this game. But it is something they may have to learn in order to cope with the Soviet Union.

Conflict, hot or cold, requires continuous prediction and planning—calling the tricks as to the enemy's present intentions and present and future capabilities and planning one's own campaign so as to win. The wider, the more complex the conflict, the more difficult it is to make correct predictions and change one's plans accordingly, and the more important it is that the predictions be made promptly. The central purpose of the kind of psywar here in question is to do things to the enemy that make it difficult for him, at the moment anyhow, to make any prediction at all that he's sure enough of to treat as firm. (Leading him to make a wrong prediction is deception psywar, not confusion psywar, though as we have noted the two shade into one another.) The result will be to delay his planning, which gains us an advantage in time, and get him worried about the delay, thus maximizing the likelihood of his planning badly. The perfect example is the practice, attributed by some observers to the Communists, of simultaneously playing both sides of the political market; for example, both supporting and opposing the UN, or supporting a strike and urging policies sure to make it fail.

ORO-T-214

191

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

One further point is that the feasibility of confusion psywar varies with the extent to which the enemy, in making predictions, must rely on data that he can get only or mostly from his opponent's official releases. If he has independent sources of information as to the opponent's capabilities and intentions, in other words, the opponent's attempts to confuse him will merely amuse him. This, of course, is why the totalitarian states are in a better position than the democracies to achieve the goal of confusion.

Cooperation

Cooperation is the chief goal of consolidation psywar and also the chief goal of political warfare directed at allies or neutrals. In the very nature of the case, therefore, it offers the operator a wider choice of media than the other goals we have been discussing and lends itself much better than they to, for example, the slower printed media, the poster, the meeting, and the motion picture, which usually cannot get through to an enemy target audience.

When a psywar operator plans a campaign aimed at cooperation he is trying to win friends for his country and influence people to believe as he does. For example, it has been one of the continuing tasks of America's political warfare to keep the friendship of the nations of Latin America. Both sides in the cold war have been directing cooperation psywar at neutral areas like India and the Arab world, in the hope of winning the friendship of those rich and powerful countries and, ultimately, making allies out of them. Since the end of World War II, both the Soviet Union and the United States have completed extensive consolidation operations—the Soviets in the European satellite states, East Germany, and North Korea, and this country in its zone in Germany and in Japan. The Russian techniques and political goals have, of course, been quite different from this country's. The Russians have fastened a rigid control on the sources and processes of power; they have imposed a communication monopoly and used every channel of communication and every possible hour of time to drive their teachings home. The United States, by contrast, has tended to let the Germans and Japanese work into the patterns of democracy in their own way and has opened the channels of communication to and from them by helping to restore their newspapers and educational systems. But regardless of the difference in technique and in political master plans, the object on both sides has been cooperation.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONPrivatization

By privatization we mean the directing of a person's thoughts to his own troubles and needs, with a resulting decrease in his attention to his country's problems and needs. The soldier who gives himself over to thoughts of his own discomfort and homesickness is not likely to be an efficient soldier, or a good member of a working military team. The civilian workman who gives himself over to thoughts of his own discomfort and the injustices being done him in war work is not likely to be an efficient war worker or to help morale in his war plant. Privatization may therefore be the goal of either tactical or strategic psywar, but it is seen most commonly in tactical operations. Examples of this tactic are Figs. 4 and 5 and the frostbite leaflets of the Korean war, the leaflets and broadcasts about what the Communists are doing to the villages and farms back home, and the material about lack of medical care and scarcity of food. All these were designed to encourage the soldier to privatize, to turn his attention away from his military job toward himself and his nonmilitary connections, and thus to win all or part of his effectiveness away from his army.

Panic

The response Gideon desired and got from the Midianites was panic. The German blitzkrieg across France and the Lowlands was, in part at least, a psywar measure of this type and depended for its tactical success, in large part, on its success as psywar. The screaming dive bombers, the terrific destruction in Rotterdam, the careful propaganda build-up, that is to say, were all calculated to arouse panic; paralyze transportation, supply, and communication systems; and disorganize the opposition. Panic was also one object of many Nazi bombing raids and of the flying-bomb attack on Britain. Such measures are based on the notion that an enemy ridden by panic will not produce and that in a closely organized operation like modern warfare even a small center of panic may seriously weaken the whole. A factory center where production notably falls off may handicap a nation's entire war effort. A single unit that abandons its place in the line may lose a battle for a whole army.

It is hardly necessary to say that the atomic bomb provides a new and overpowering reason for understanding not only the offensive use but also the defensive control of panic in warfare.

ORO-T-214

193

RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATION**PSYCHOLOGICAL WARFARE AS PART OF A TOTAL OPERATION**

The uses of psywar are therefore as broad as a nation's ability to implement its policies and programs by the communication of messages. But if the question is asked the other way—What can psywar be counted on to do? —then it becomes important to enter a word of caution.

Psywar per se is not a mighty weapon in the way that much contemporary discussion assumes it to be or in the way that the atomic bomb is a mighty weapon. A single atomic bomb may kill thousands of people, lay waste miles of countryside, and force a nation to its knees. A single act of psywar (a leaflet, a radio broadcast) is not likely to bring about the submission, subversion, cooperation, confusion, privatization, or panic of even its target audience, much less a target country; even the cumulative effect of a series of acts of psywar, a whole propaganda campaign, for example, is likely to be very small. At most it will change the attitudes of a numerically small group of people; it is likely to change even their attitudes not very much; and, for reasons we have already seen, not all of those whose attitudes are changed by it will act in the desired manner. But this is not to say that psywar cannot change the course of events. The Communist psywar that enlisted Klaus Fuchs as a Soviet spy did not necessarily work any sea change in his attitudes, but there is reason to believe that its end result was to cut down America's time advantage in atomic warfare by several years. Psywar, in short, may well supply the nail without which the kingdom would have been lost. And no stronger claim need be made for it.

Besides being less than mighty, psywar is not a sure-fire weapon. It calls, as we shall see, for great skill, great imaginativeness and empathy, and great resourcefulness on the part of the operators; it calls for good current intelligence about the target; and like most human activities it calls, at the margin, for a bit of luck. Any of these things may be missing in any psywar operation; to the extent that any are missing, psywar will be proportionately less mighty. If many are missing, it may accomplish nothing or even hurt the cause it is intended to support. This, of course, is more or less true of all weapons. We do not know beforehand, in any given situation, what any weapon will accomplish. The nation's bets, we must remember, are on its combination or "family" of weapons, any member of which may fail it in any given situation without the family as a

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

whole failing it. And all we need claim for psywar is that it is a member of the family that has grown to be mighty enough and predictable enough that we dare not leave it at home when we go forth to do battle.

We must notice also that psywar is most likely to yield dividends when it is used in combination with the other weapons in the family. A psywar sound truck drawn up alone before the city of Willingen, Germany, without the threat or appearance of force, could not have achieved the surrender of the garrison. But a psywar mission supported by an American army was able in a few minutes to accomplish the surrender of the garrison, prevent hundreds, perhaps thousands, of casualties, and save days or weeks of fighting, thus freeing some resources for other military uses. Likewise Captain Zacharias,² broadcasting to Japan, would not have been able to sway the Japanese war policy to any great extent without the presence of the US Air Force over Kyushu and Honshu, the US Navy in the Pacific, and the Allied army poised on Okinawa and the Philippines. But when Zacharias's persuasive broadcasts were added to these factors, the broadcasts were able to contribute significantly. Wilson's Fourteen Points, one of the most effective pieces of psywar of all time, represent another case in point. By themselves they were merely lucid and rational. With the power and integrity of the United States and the Allies behind them, they were a powerful weapon that undoubtedly changed men's minds and helped bring the war to an end. And look at the other side of the present world conflict. How much more has Communist propaganda accomplished in Europe and Asia-outside-Russia because it had Communist organizations and the threat or promise of Soviet power behind it?

This principle is important. Psywar is used with greatest effect always when combined with other measures—actions, policies, military force, threats of force, etc. So used, it can broaden and increase the impact of the action, the policy, the force, or the threat, which in turn broaden and increase its impact. And thus it becomes a matter of first importance how psywar is fitted into other measures, how it is blended with other weapons to implement policy, and how its use is coordinated and timed with military, economic, or political operations.

Used well, coordinated well, psywar can often substitute to some extent for military or political force. In a situation otherwise close, it can often sway the balance. Built into a campaign, political or military, it can contribute not only to victory today but also to an easier battle tomorrow.

ORO-T-214

195

RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATION**SUMMARY**

Our topic has now moved from the process of psywar to its use, and you will recognize that we are no longer talking in the vocabulary of social psychology but increasingly in the language of politics and power. For, although psywar may be used to call forth any response which is in the power of the available target audience to make and within the power of the available symbols and media to stimulate, in practice its use is restricted to the political and military goals of the nation that uses it.

Its broad targets are therefore groups that can exercise or implement or at least affect power relations, that is, the political elite; military elite, military population, and working population. You will find it useful to remember Speier's classification¹ of the power areas that psywar seeks to influence: the deciding of foreign policy, determination of military missions, ability to govern, ability to command, will to obey, and will to fight.

In the area of foreign policy, psywar may have, among other purposes, those of supporting diplomatic negotiations or political objectives, gaining the support and cooperation of neutral countries, strengthening or weakening alliances, deterring a nation from aggression or clearing the way for aggression, and bringing about the final capitulation of an enemy nation.

In the area of military missions, psywar may be used to influence the design of enemy strategy and tactics, to enhance military deception, to affect the will of command to begin or continue fighting, and to rouse public opinion or political pressures for or against a military operation.

In relation to the ability to govern, psywar may be employed to interfere with control systems or with communication, to help build counterelites, to make friendly leaders stronger and enemy leaders weaker, and to support resistance movements and gain support in newly liberated areas.

In the area of ability to command, psywar may be used to produce dissension among enemy forces, to strengthen friendly leaders and weaken enemy ones, to convey deceptive intelligence and to disrupt communications, to support military government, and to elicit information of military value.

As a weapon against the will to obey, psywar may be used to stimulate dissension between military and political elites, to disrupt communication between leader and followers, to undermine confidence in leadership and war aims, to reduce the incentive to work, to affect willingness to make sacrifices and

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

face dangers, to cause panic, to encourage a sense of inequality and unfairness, to encourage the self-interests of minority groups, and to help in the subversion of key personnel.

Against the will to fight, psywar can be used to encourage surrender and especially to reduce last-ditch resistance, to induce a sense of unfair treatment, to increase the impact of weapons, and to contribute to the subversion of key personnel.

You will recognize, of course, that these are merely examples and not inclusive lists.

You may also want to remember the list of the chief responses psywar is used to seek, as given in this chapter. These responses are submission, subversion, confusion, cooperation, privatization, and panic—and their opposites. Moreover, psywar is often called upon to counteract enemy attempts to produce these responses.

Finally you will want to remember that psywar derives its chief effectiveness from being a part of a total operation. It is not by itself so mighty a weapon as, for example, the atom bomb. But used well, coordinated well with other instruments of power, it can often sway the balance between victory and defeat.

SECURITY **RESTRICTED** INFORMATION

CHAPTER 6

BACKGROUND OF THE PSYCHOLOGICAL WARFARE DECISION

The use of psywar requires a series of managerial decisions. On the highest echelons these are closely related to policy. On the lowest echelons they are concerned with technique. Across the continuum from policy to technique, however, the basic questions are the same: What shall we try to accomplish with psywar? With what target? When? How?

No psywar decision, however, can be properly made in terms of purely technical considerations, as if psywar were an isolated activity. Psywar planning must work, at all echelons, not only (1) within the framework of policy and objectives but also (2) within limits set by operational plans and capabilities, and (3) within limits set by intelligence, both basic and current. Otherwise, it would leave out of account much essential information about potentials, capabilities, and vulnerabilities; cut itself off from the reinforcing power of events; and, worst of all, commit its government—in other peoples' eyes at least—to promises that cannot be redeemed, policies that cannot be carried out, etc. Indeed, the three limiting considerations of psywar planning are so important that they may well be restated: The psychological warfare decision must be made (1) within the framework of policy and objectives; (2) in conjunction with operational plans, and with an eye to operational capabilities; and (3) in the light of the fullest possible intelligence about the target.

These three requirements for the sound psywar decision will be discussed in the following sections.

POLICY AND OBJECTIVES

By policy we mean what Lerner¹ has called "the continuous effort to shape the future by decisions in the present." A confused policy, then, is simply one in which clear and unambiguous and

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

consistent decisions about shaping the future fail to get made. A faulty policy exists when present decisions are of such character that they will not shape the future in the way the policy makers intend. A "sound policy," on the other hand, is one that uses all available means and instruments to produce decisions that will make future events develop according to our stated goals. Hence the soundness of any policy decision is "to be judged by its effectiveness in modifying given conditions toward desired goals."

Now it is apparent that psywar is one of the instruments just mentioned. Its assignment is to modify "given conditions toward desired goals." It must also be apparent that psywar can never be better than policy. If policy is confused, can psywar be any different? If policy is faulty, can psywar hope that its efforts will forward national objectives? The answer, clearly, is no.

The layman's stereotype of the propagandist or the psychological warrior is that of a magician who moves men around with word-wizardry and reshuffles world events to suit himself. We know it is not so. We know that if our Asia policy is confused, no psywar, no matter how brilliant, can keep our affairs in that area from going badly. We know that if our policy in regard to resisting Communism turns out to be faulty, then God pity us, for no psywar operation is going to be able to save us. In fact, that stereotype is one for both the psywar student and the political leader to put out of their minds—the former because he needs to get rid of any lingering suspicion that his task is to make foreign policy, and the latter because he needs to get rid of any lingering suspicion that if he fails to clarify policy goals, or chooses wrong, then his psywar man can straighten things out for him, or cover up his mistakes.

Psywar, then, is an instrument of policy and a means toward accomplishing objectives. The responsibility of the policy maker is to present the psywar operator with a clear and a sound policy. The responsibility of the psywar man is to implement that policy with effective messages. He has, no doubt, a further responsibility to give advice, when asked for it, as to what the psychological effect of a policy will probably be, and what the psywar implementation of a policy will call for in the way of resources, modified directives, etc. But chiefly he is presented with a policy, and he translates it—at the level of his echelon—into directives, campaigns, media choices, and messages.

The various types of psywar differ in their relation to national policy. Into the planning of political psywar, for example, national policy enters directly; it enters somewhat less directly into the

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

planning of strategic and consolidation psywar and least directly into the planning of tactical psywar. No psywar planning, however, can leave it out of account or go against it. Take, for example, the policy stated clearly by the President during World War II, that the only terms to be offered our enemies should be unconditional surrender. This national policy reached down even to the tactical level, greatly restricting what could be said to the Nazi armies by way of persuading them to lay down their weapons—partly because of uncertainty as to what could be said and what could not. General Eisenhower tried unsuccessfully to get a clarification from higher authority of what unconditional surrender actually meant, so that enemy troops could be told clearly what to expect if they were to give up the fight. Some observers believe, indeed, that the policy seriously handicapped our psywar effort in Europe, and this is a good place to repeat the objection to which such statements are open. What is meant by this one is that more Germans would have surrendered, after seeing our leaflets, if the latter had not had to stress unconditional surrender. But since our national policy makers did not want surrender on terms other than unconditional capitulation, any surrenders psywar might have got on other terms would have forwarded no US objective and would have been pointless or even harmful.

Military objectives enter most directly into the planning of tactical psywar, less into strategic and consolidation, least into political; but they must be taken into account in the planning of every kind of psywar. For example, the fact that the United States is not able or eager to undertake certain military commitments in far places sharply limits what Voice of America (VOA) can say or imply, by way of threats or promises, in political psywar.

The planner of psywar will therefore work within the blueprints of policy and objectives, and the planning priorities will be congruent with the priorities for goals and objectives. Even with that understood, however, there are some aspects of the relation of policy and objectives to planning which continue to cause confusion in psywar circles.

For one thing, every psywar situation involves some combination of short- and medium- and long-range policy goals and military objectives. Policywise, for instance, a current operation might involve an immediate political goal of this or that character, the medium-range goal of victory in an international conflict, and the long-term goal of such and such a kind of international reorganization after the conflict. In a military psywar operation the goals might be a successful strategic retreat in a

SECURITY **RESTRICTED** INFORMATION

particular sector, victory in the campaign, and unconditional surrender by the enemy in the war as a whole. Psywar planning is likely to be at its best when the long-range objectives, political or military, have been as clearly defined as the medium- and short-range goals. Otherwise there is likely to be waste motion, even motion at cross-purposes. General Robert A. McClure has told how our psywar in Europe came a cropper by widely publicizing to the enemy our strict adherence to the Geneva convention—a policy that seemed obviously safe in the absence of policy statements to the contrary. "It was a good 'selling point' to prospective prisoners of war," General McClure² says. "Very late in the Normandy campaign it was discovered, by chance, that we would not necessarily adhere to the provision of 'early return to your homes.' The decision to use prisoners of war for reconstruction labor did not reach the psychological warriors until after we had committed our Governments to a course of action they did not intend to follow."

It is probably easier for a government that has come into power through revolution, and has thereby learned the lesson of waiting and looking far ahead, to plan in long-range terms. A totalitarian government, where power is centralized, has a considerable advantage in this regard over a democracy, where public opinion must enter into every basic decision and where policy may vary with the shifting winds of politics. Again, it is notoriously more difficult for a wartime coalition of governments to make and state clear long-range policy than for a single power to do so. And it is a truism that if policy and objectives are short-range and opportunistic, then not only psywar operations but military and political operations also may be wasteful or harmful.

The planner of psywar must therefore use to the full such long-range policy directives as he can get. America's psywar messages addressed to occupied Europe in World War II furnished an interesting example of this problem when it came to deciding what should be said to the French people. One of the objectives was obviously to strengthen and encourage the French resistance movement. At the same time, political exigencies led the US Government to the decision that it must work with the collaboration government of Petain. Thus, although the Resistance was actively opposing the Petain government, it was decided that none of the US propaganda should attack Petain, on the theory that, whereas the United States would aid anyone who opposed the Nazis, long-range policy did not indicate the wisdom of aiding Frenchmen to fight Frenchmen.

SECURITY **RESTRICTED** INFORMATION

The solution, however, lies only in small part with the planner of psywar. It is the policy maker himself who is obligated not only to plan in as long-range terms as possible but also to state long-range policy clearly and fully for his psywar operators and to consider the potential effect of an intended policy on his world relations. Even short-range military action should, in future more often than in the past, be designed with an eye to its psychological effect on longer-range military and political objectives. The short-range goals may be deceptively clear. Thus it seemed desirable at the time to bomb the monastery on Monte Cassino. But the use the Nazi propagandists were able to make of that action on our part, and its powerful effect throughout Italy and the Catholic world, lead us to believe now that a second look at that objective might have been indicated before the planes were dispatched by our commanders.

In practice, policy usually presents itself to the psywar operator as a directive, an official statement by a government or theater command, a public address by an official able to state policy (Roosevelt's and Churchill's speeches proved the best sources of policy for SHAEF psywar), or an act of a congress or parliament. Short-range military objectives usually appear in the form of a briefing or a command request for aid. Long-range objectives and timetables tend to be available in direct proportion to the degree of confidence in which high command holds psywar. In any case, before the psywar operator turns any policy or objectives into messages, he should drop in at Operations and Intelligence.

OPERATIONS

Psywar's problem with operations is a problem of integration. This is a two-level problem. On one level, that of fitting psywar into a local situation, the field operator can do much toward solving the problem himself. This, equally in military and nonmilitary psywar, is in large part a matter of cultivating good personal relations with operating personnel (the -3 people—A-3, G-3, S-3—and the local embassy), and bringing them to see how psywar can help them, and, finally, of conducting psywar operations with a minimum of inconvenience to and interference with operations in general. Psywar, for example, must not monopolize local printing facilities or expect leaflets to take precedence over ammunition when a truck is going up to regiment. On a higher level, however—that of integrating psywar into the total national program—there is

ORO-T-214

203

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

not much the psywar operators can do. And yet this is far and away the more important of the two problem levels.

We have said that psywar is one of several instruments of policy that every nation has at its disposal. According to Harold Lasswell,³ we may distinguish four such instruments: diplomacy, propaganda, economics, and arms. There is good reason to believe that three of these instruments of policy are, on the highest levels of policy in the United States, integrated pretty well into the national program. If a diplomatic action is to be taken—for example, if diplomatic recognition is to be withheld from Red China—there are reasonably good guarantees that the things the diplomats will do to that end will support and not weaken other US policies, will themselves be backed up by other US government action, and will not be decided on in the first place without careful study of how they fit into the total picture. Similarly with international economic decisions—for example, when money is to be allocated to prime the economic pump in Europe—there is a reason to believe that top-level officials in all departments concerned will enter into and affect the planning. When an important military decision is to be made—for example, when it was decided to resist Communist aggression in North Korea—the decision was undoubtedly coordinated not only with numerous nonmilitary programs in the US but with the policy makers of other nations as well. With all three of these weapons, in other words, there are prior guarantees of support for the weapons from other quarters when it is needed, and prior guarantees against actions being taken without regard for their implications for other programs, and thus against the Government's left hand acting at cross-purposes with its right hand.

But what happens to the fourth weapon at the top level?

Bruce Lockhart,⁴ chief of British psywar in World War II, writes thus of his own government's attitude: "No serious impetus was ever given to our propaganda efforts from on top. It was due, I think, partly to the pressure of graver events and partly to ignorance of the subject in Whitehall. The ignorance bred skepticism, and together they were a formidable hurdle."

Daniel Lerner,⁵ in his account of European psywar operations, speaks regretfully of "the lack of interest in sykewar displayed by most top American officials responsible for the policies and conduct of the war."

Carroll⁶ testified:

It was a curious fact—and I had confirmation of it later—that the President, who established the OWI, never knew what it was doing, and sometimes, apparently, confused it with the Office of Censorship. He had been opposed to the creation of the propaganda service and had

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

established OWI with considerable reluctance, under pressure from his advisers, whose primary aim was to provide an adequate flow of information to the American public. Once the organization was established, he did not want to be bothered about it. In his own right Roosevelt was a great propagandist. . .but he did not understand the systematic use of propaganda in total war.*

Carroll adds that Cordell Hull "knew even less than the President about OWI and cared about as much."

General McClure,² who commanded the psywar operation at SHAEF, writes ruefully: "An understanding of the proper source of Government policy, its actual communication to the field by a reliable, rapid channel, a feeling of belonging to a properly organized team owing allegiance to the commander under whom it was serving, and not to several independent Government agencies, would have solved most of the Psychological Warfare difficulties in SHAEF."

This matter of integrating psywar into the total international operation of a nation is the most important operational problem that psywar faces. It was not solved in World War II, as the preceding quotations indicate, and almost certainly has not been solved since. Yet until psywar is integrated into planning at the highest levels, the full potentialities of the weapon will never be exploited.

Need we say that the Russians have no such difficulty? Both their doctrine and their tradition give propaganda a conspicuous place in carrying out policy. They have never forgotten, as Lasswell³ points out, that the revolution of 1917 was prepared by years of activity during which Party members devoted most of their energies to propaganda. Since 1917 they have seen propaganda help to knock off one after another of their neighbors. Essentially psywar means to them a highly effective and fantastically inexpensive instrument for achieving world domination. It is as much a part of their over-all operational plans as is the Red Army. With us, however, this lesson seems not yet to have been learned.

This, we repeat, is a problem for the chiefs, which psywar operators can affect only by gradually getting across to the chiefs how much easier their task would be if this country imitated the Russians a little in this regard. In local operations, however, the principle is the same—psywar, as one striking arm, must synchronize with the other striking arms—and psywar personnel can, we repeat, to some extent take the initiative. How necessary this is America learned the hard way in places such as Aachen, where leaflets and loudspeakers, improperly coordinated with

*Reprinted by permission of author and publisher.

SECURITY RESTRICTED INFORMATION

military force, failed to bring about the surrender of the city's garrison, and where, consequently, more lives were spent than should have been required.

Properly used, political, military, and psychological effects can interact to make each other immeasurably stronger. An example of this was flying the Hump into China. The military effects of the supplies American planes were able to deliver to Chungking were significant. But even more important was the political effect of encouraging the Chinese government to resist. Perhaps most powerful of all—and immensely influential on Chinese resistance—was the demonstration of America's strength, skill, and determination to enemies and Allies.

Another convincing demonstration of the power of coordinated political, military, and propaganda actions was the Nazi campaign in Europe which Taylor¹ so aptly called a "strategy of terror." The political pressure from Berlin, the screaming Stukas, and the threatening radio all drove toward the single goal of Nazi conquest.

In the practical sense, therefore, psywar is always dependent on operational capabilities in two fields. One is for political, military, and perhaps economic action of a given kind at a given time. It is, of course, essential to know operational capabilities and intentions before making promises and threats in psywar output. It is equally important to time and phase psywar with the operational schedule. The airlift into Berlin was an example. Even without a word of propaganda the lift was a magnificent piece of psywar. On the other hand, if our intentions and capabilities had been made known before the lift began, if our psywar operators had been able to tell the world what the Free World was prepared to do to resist aggression in Berlin, then the effect would have been still greater. For the audience would have been able to watch the whole action develop, like the plot of a story, with the conflicting intentions clear and the action clearly demonstrating a victory which counterpropaganda would have had a harder time befogging and belittling.

In the second place, psywar is dependent on operational capabilities for delivering a message in a given way at a given time. If, for example, no qualified psywar personnel are available when and where they are needed, the psywar weapon simply cannot make its contribution to the achievement of the national purpose. If none of the short-wave stations reach country A, then radio psywar to that country is, for the moment, out of the question. If no loud-speakers are available, obviously that method is impossible. If

SECURITY **RESTRICTED** INFORMATION

it takes a week to print and disseminate a leaflet, the capacity of psywar to affect tactical situations will be smaller by far than it might have been if facilities were available for getting leaflets out on short notice. If an airplane is available only on Tuesdays to drop psywar materials, then other methods of dissemination must be used on the other six days unless, from psywar's point of view, they are to be wasted.

The extent of operational support now required by, for example, strictly military psywar, may be judged by a simple set of figures. In World War I all belligerents dropped a total of about 20,000,000 leaflets. In World War II the Western Allies alone dropped 1,250,000,000 leaflets. Approximately that same number were dropped by this country alone in the first 21 months of the Korean operation.

The extent of coordination required of a combat psywar officer is illustrated by a study made by the Army psywar training school. A combat psywar officer is expected to be responsible for effecting coordination with various military agencies concerning the following matters:

<u>Individual or Group</u>	<u>Activity</u>
G-1	Procurement of psywar specialists Obtaining information concerning prisoners of war
G-2	Provision of intelligence material for psywar purposes, including intelligence of the enemy in general and of the forces in contact in particular, and intelligence of enemy propaganda principles, organization, and technique Assistance in the planning of psywar operations Estimating effectiveness of friendly and enemy psywar operations Designating prisoners of war and others with informa- tion of value for psywar purposes, and those suitable for use in broadcasting, writing leaflets, and other activities of psywar interest Assistance in the planning and supervision of training and other activities concerning defense against enemy propaganda
G-3	Obtaining information concerning current and future operations

SECURITY **RESTRICTED** INFORMATION

Individual or Group	Activity
	General staff coordination and supervision of the planning and conduct of psywar operations
	Surrender technique to be given to the enemy
	Training troops in psywar, to include defense against enemy psywar
	Allocation of ammunition for propaganda dissemination
G-4	Procurement of special supplies
	Transportation
	Storage areas
Civil Affairs or Military Government Officer	Obtaining information concerning displaced persons Reestablishment of information services
Signal Officer	Assignment of radio channels Provision of communication equipment, maintenance, and repair Provision of communication facilities Obtaining photographs suitable for propaganda purposes Effective signal security
Artillery Officer	Recommendations concerning allocations of ammunition for propaganda purposes Selection of units to fire propaganda missiles
Ordnance Officer	Obtaining information on technical matters relative to communications and weapons suitable for dis- semination of propaganda
Engineer Officer	Maintaining reproduction equipment
Surgeon	Caring for wounded prisoners
Public Informa- tion Officer	Obtaining press and photography releases Preventing conflict and contradiction between informa- tion released to the general public and the armed forces, and propaganda directed toward the enemy

SECURITY **RESTRICTED** INFORMATION

Individual or Group	Activity
Troop Information and Education Officer	Suggesting effective indoctrination of troops against enemy propaganda Preventing serious conflict between propaganda directed toward the enemy and information supplied to the troops
Air Force Personnel	Leaflet and airborne loudspeaker missions Bombs and aircraft for propaganda missions

This listing, of course, applies specifically to an army psywar officer, but something like this relation must exist between the psywar planner and his related operational units not only in the other two services but also, with, however, very different entries, between the civilian operator and his embassy. In fact the relation should be even closer than that described, because the channels are not, as the listing might seem to imply, one-way streets. As the psywar officer gets help and advice from the officers named, so also should he be responsible for giving advice and information to them—opportunities he sees for the use of psywar, ways in which combat operations might be scheduled or directed for maximum psychological effectiveness, facts that fighting personnel at all levels should know about the use of psywar in general and his use of it in particular, information that should be given to troops by way of counteracting enemy propaganda. In other words the relation ideally is much more than support of psywar by operations. It is really integration of psywar into operations toward a common objective.

INTELLIGENCE

Psywar intelligence is the only thing that keeps psywar from being an absorbing but exceedingly dangerous game of blindman's buff. Every other condition of the game conspires to make it just that—the distance over which the psywar operator must operate, the effort of the enemy to keep the true facts and situation hidden, the barriers of international suspicion, the difficulties of intercultural communication. The mission of intelligence is to see through

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

barriers like these and to maintain a continuing flow of information and evaluation, on the basis of which policy can be translated effectively into operations.

Actually, psywar needs two kinds of intelligence, which have sometimes been called "basic" and "output" intelligence. The purpose of the first of these is to provide, on a day-to-day basis, the clearest and most objective possible picture of the target. This includes its strengths and vulnerabilities, psychological and physical needs, attitudes and morale, programs and expressed policies, and the existing channels for reaching the target. The major requirement here is the highest possible degree of accuracy.

Output intelligence, on the other hand, is concerned not so much with accuracy as with verisimilitude. This is the flow of material from which the writing and production staffs of psywar are able to construct leaflets, scripts, and other messages. It includes incidents, names, statements, descriptions, maps, and other details that can be used directly to make psywar materials sound real. Output intelligence may even include such details as telephone numbers; in fact the British political intelligence division in World War II was several times asked to provide telephone numbers of German citizens for use in radio broadcasts.

These two kinds of intelligence are not always good neighbors. The kind of mind that is most useful in gathering basic intelligence is the social science mind, able to sift and weigh and evaluate. The kind of mind that is most useful in gathering output intelligence is the imaginative mind, able to see facts as a writer does, and fasten on the details which, given creative treatment, will make a psywar message. These two approaches may be good for each other. That is, the sober, careful attitude of the basic intelligence man will keep the output intelligence man from going off half-cocked. On the other hand, the constant pressure of the output man will tend to keep the basic intelligence man aware of the practical uses of his results. So it is in theory, at least. In practice, it has usually been found necessary to separate the two functions. In SHAEF, during World War II, two officers were separated from the main intelligence unit and assigned full-time to providing output intelligence; in addition the writers themselves gathered a good deal of such intelligence from prisoners and documents. In FEC, Tokyo, during the Korean operation, the basic intelligence function was assigned to an intelligence unit reporting directly to the commanding officers of the psywar section. Output intelligence—for example, preparation of background memoranda by means of which the writers could handle the specified themes for the

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

relatively unfamiliar Chinese and Korean targets—was assigned to an intelligence unit of the operational group.

There are two general sources for intelligence material of these kinds. One is the broad background of relatively unchanging fact which is represented, in a psywar operation, by previous training in the culture and physical nature of the target area, by reference books, and by psywar personnel who have lived in the target culture. This is chiefly a matter of previous preparation. When a psywar operation begins, it is too late to do much toward filling this gap except by drawing on what has been done before. When the Korean operation started, for example, we were short of psywar personnel trained and experienced in the Korean culture, although we did what we could by gathering reference materials and hiring Korean natives. The same situation will exist in future operations unless we meet it with a program of training, here and abroad, and an extensive program of fact gathering with a view to psywar needs.

The other source of material is the day-to-day input by which the picture is kept detailed and up-to-date. This comes from documents, from prisoners, from exiles and refugees, from observation, from our own secret agents, and from the publications and broadcasts of the target and related states. In a military operation it comes in large measure from prisoners. As Hertz⁸ said of the operation against Lorient in World War II: "Our existence as a functioning tactical unit depended on intelligence from prisoners. We ate, slept, and drank with prisoners. Many nights I was awakened by members of our crew dragging in deserters, who sat on my bedroll, dripping the waters of the river Scorff as they told us the latest Winchell dope on what went on inside the fortress." Hertz was interested mostly in output intelligence. Prisoners were also a source of basic intelligence. As a matter of fact, interviews with prisoners were used during the European operation in 1944 and 1945 as a source from which to make up a constantly changing index of Wehrmacht morale, which was invaluable in timing psychological operations.

The outline of topics on which SHAEF interrogators questioned prisoners for psywar purposes is interesting as an illustration of the kinds of subject on which information is needed. After getting basic information on the prisoner's name, rank, unit, personal history, etc., the interrogator went through the following 19 topics:

- (1) Contacts with and reactions to Allied propaganda
- (2) Contacts with and reactions to German propaganda

SECURITY **RESTRICTED** INFORMATION

- (3) Attitude toward last-ditch warfare
- (4) Expectation of outcome of war
- (5) Attitude toward possible Allied occupation
- (6) Specific concerns with possible postwar situation (revenge against civilian population; looting, destruction of property, rage; unemployment; lack of food)
- (7) Postwar expectations for Germany
- (8) Attitude toward National Socialism
- (9) Attitude toward Hitler personally
- (10) Attitude toward other Nazi leaders, including lower Party functionaries
- (11) Ideas on war guilt
- (12) Feeling of political responsibility (who should be held responsible?)
- (13) Fear of ill treatment as POW
- (14) Attitude toward senior leaders
- (15) Attitude toward immediate officers
- (16) Reactions to Allied weapons
- (17) Service conditions (food, health of unit, mail, types of reserves encountered, etc.)
- (18) Rivalries in Wehrmacht
- (19) Home-front situation (underground opposition, attitudes of and toward foreign workers, family life, morale effect of air raids, etc.)

This is, of course, not the only kind of POW interrogation. There are many other kinds of information which military intelligence can extract from prisoners—for example, on the movements, equipment, and training of their military units; names of officers; precise information on location of factories, transportation lines, and other bombing targets; etc. But questions like those are bound to be asked anyway, and the problem of psywar is to get its kind of question asked along with the others. That is why the SHAEF structured interview is worth study. Notice that it begins with an attempt to get a general picture of how many and what kind of leaflets and broadcasts were reaching the POW's unit, then asks a series of questions about expectations. There follow questions on the POW's feeling toward his leaders, toward the party, and toward the subject of war guilt and the kind of Germany that should come into existence after the war. Then the questions turn to more direct Wehrmacht experiences: service conditions, rivalries in the army, and reactions to the quality and effectiveness of Allied weapons. Finally, there are questions about what the soldier has heard of conditions on the home front. Thus the

SECURITY **RESTRICTED** INFORMATION

interrogator should be able, if he gets good cooperation from his POW, to estimate what the prisoner knows about the war, the needs in him to which psywar might have appealed successfully, the main structure of his political attitudes, and his strong group loyalties and alliances. Furthermore, by finding out these things for a large number of prisoners, it is possible to plot the change over a period of weeks or months (for example, who they think is winning the war, their attitudes toward a possible occupation, their service conditions, and their attitudes toward their superior officers and toward the top men) and thus obtain a curve from which both morale and response trends can be deduced.

A basic problem, of course, is always the "thousand yards," that is, what happens to a soldier when he has ceased to be a fighting man and become a prisoner. It is very difficult to estimate what allowance to make in projecting a prisoner's attitudes to enemy soldiers still fighting. It is sometimes difficult, also, to know how much credence to put in prisoners' answers. Sometimes they lie to please their interrogators, sometimes to misinform them. An experienced interrogator can often tell when this is happening and minimize it with well-asked questions or allow for it in his estimates of the prisoner's reliability. Furthermore there is some safety in numbers in a case like this; one prisoner's report can be checked against others, and all against other evidence.

Other information, as we have said, comes in large quantities from documents. After D-Day we realized how much documentary material had not been available to us previously. As soon as we began to move into Brittany, we captured a wealth of personal letters, Army and civilian orders, textbooks and manuals, newspapers, magazines, and diaries, which proved to be a mine of intelligence information for psywar. The psywar man ordinarily has at his disposal one or a number of intelligence digests, and either he or some other agency monitors the enemy radio and examines such enemy leaflets and other publications as can be obtained.

The breadth and variety of questions put to psywar intelligence is startling to a person unfamiliar with it. For example, here are samples of the questions put to psywar intelligence in the Far East theater during the Korean operation:

Is the Chinese attitude toward surrender like that of the Japanese?

What percentage of the Chinese fighting in Korea are former Chinese Nationalist troops, and are they specially vulnerable to surrender propaganda?

SECURITY RESTRICTED INFORMATION

What do the Chinese now think of Sun Yat-sen? (The intention was to make propaganda use of the way the Communists had put aside the principles of Sun.)

What keeps the guerrillas fighting?

How much is our radio being heard in North Korea?

What do the Koreans think of what the Communists have done to emancipate Korean women?

These are only samples. If we try to analyze more systematically what intelligence should know in order to fill out psywar's picture of its target, we come out with something like this:

Physical aspects of the target

Population figures, appearance of the country, climate, seasons, size and plan of cities, transportation system, plant life, crops, what the people especially value about the physical nature of the country, etc.

Social background

History of the country; group structure of the society; role habits of the people; values and beliefs; traditions and symbols; institutions; distribution of wealth and income and ways of earning money; leaders in different fields; their quality, reputation, and biographies (and their present whereabouts and habits, which often make good output intelligence); typical ways in which business, industrial, professional, farm, and labor families live; educational system of the country; recreational patterns; how social change is accomplished in the country; etc.

Communications

What is the literacy level in the country and how widely are the mass communications distributed through the population? What kind of mass communications are the people used to? How do experts in the target country use the communication system to change attitudes and bring about action? What special communication patterns such as color symbolisms ought we know about? In general what do the people in the target know about given events? How and to what extent does the target government isolate its people against foreign propaganda? How can America get its propaganda in at least risk to its recipients?

Propaganda line

What is the target telling (a) its own people, (b) its allies, if any, (c) US Allies, (d) the United States?

SECURITY **RESTRICTED** INFORMATION

Political situation

What is the political philosophy behind the target state?
What is the organization of the government, nature and strength of the control system, relation of the government to everyday lives of the people? What are people's attitudes toward the government and different groups of government officials, the apparent long-range goals of the state, the apparent immediate goals, the capabilities of the government-in-power for suppressing deviant opinion, the groups or individuals that have political power and those that have power to inconvenience or overthrow the government, etc.?

Military situation

Nature and organization of the military service, its traditions, its equipment, the care it takes of troops, kind and amount of training, living conditions in the services, what troops think of US weapons, relation of military to civil power, attitudes of soldiers toward military leadership, evidence of cleavage if any in the services, heroes of the services, whereabouts of given units or of ships, apparent military plans and capabilities, etc.

Personality needs and group relations

Evidence of personality needs to which psywar might appeal, signs of frustration, indications of group tension or of significant deviance, general pattern of attitudes as nearly as it can be inferred from opinions and actions, evidences of strong attitude structures characterized by ego involvement and emotional bias, state of morale in armed forces and among civilians, groups which have power to reinforce deviance, etc.

General assessment of target

Strengths—points where attitude structures and action patterns are most likely to resist change but which, if changed, would represent substantial deterioration in enemy position.

Vulnerabilities—points where attitude structure and action patterns are most likely to be susceptible to change in a desired direction but which may or may not represent worth-while goals for attempted change.

Trends—of policy, propaganda line, public opinion, morale, deviance, and other factors of psywar importance.

SECURITY **RESTRICTED** INFORMATION

General assessment of US psywar's effect on target

What groups is US psywar reaching, and what are the known responses? (Some ways of arriving at information of this kind will be discussed in a later chapter.)

Obviously this outline is neither complete nor tailored to any particular kind or location of psywar. For tactical psywar, on a mountainside in Korea, one part of it would be much more important than others; for political broadcasting, as by the VOA, other parts would be important. However, this is not the place to go into the problem of how to expand these sections or how to gather the information.

And perhaps in a chapter like this, which must treat a great mass of material in a suggestive rather than inclusive way, we tend to be too general and not practical enough. Intelligence is extremely practical. It may help you to think of material like this in practical terms if you think of what a minister needs to know about one of his parishioners with whose beliefs and values he is concerned, or what a teacher needs to know about one of his pupils with whose social knowledge and attitudes he is concerned. Obviously, he needs to know as much as he can. To begin with, he is thoroughly familiar with the social milieu in which the parishioner or the student lives; if he himself has grown up in that milieu, so much the better. He even knows the person's history, and how his home looks, and probably the heroes he holds and the symbols he is used to hearing and seeing. He knows, or soon finds out, what the individual knows and believes about the subject under discussion, and he is in position to find out very soon how he can appeal to the individual; what inner needs and outer group relationships will have to be involved in any changes that are made. Furthermore he can watch the results of anything he says. That is what the preacher or the teacher needs to know as a minimum. But now move the preacher or teacher a thousand miles away and let him talk to persons he has never seen and who are not particularly anxious either to hear or see him. That is more like the situation of the psychological warrior. And intelligence, by one means or other, has to fill in the gap.

What, in practical terms then, does the psywar man need from intelligence? Obviously, the best and most complete picture he can get. Anything intelligence can do to help him along toward the kind of knowledge and understanding the minister or the teacher either has to begin with, or easily acquires—anything intelligence can do in that direction will be valuable. If intelligence can fill in the outline we have just given, then it will be doing its job well.

SECURITY **RESTRICTED** INFORMATION

But suppose we have to cut the information to bare essentials: what are the essentials? For the answer to that, let us go back to the psywar process as we described it in Part II of this book. The psywar man needs to know from intelligence, more than anything else:

First, how he can get attention for his message, that is, what medium, what timing, what approach, what treatment, and perhaps what segment of a target?

Second, how he can talk to the target, that is, how can he clothe the subject with the right symbols so as to get his meaning across?

Third, what he has to change, that is, what are the attitudes and action patterns of the target with reference to the particular subject under discussion?

Fourth, what are the conditions of change, that is, what are the personality needs of the target to which a message can be made to appeal; and what are the group relations which can be made to reinforce the desired change or from which the target individuals will have to deviate?

And finally, when he has sent his messages, what are the results, that is, are the messages being received, and what kinds of responses are they eliciting?

As an example of the specific use that can be made of this kind of intelligence consider the accompanying leaflet message. This much-admired British leaflet of World War II was written in German but still retains its beauty and effectiveness in English translation. Many critics have remarked how well the leaflet fits the spirit of the German soldier, and Speier says that when you study this leaflet carefully, in the light of its situation and its intended audience, you will come to the conclusion that you will be hard put to find more vicious propaganda anywhere.

TO THE SOLDIER WHO MARCHES WEST

You are still alive. It is wonderful. Everything that lives is wonderful, even the green grass and the birds.

The dead and the rocks and the soil and the dung—they are nothing, for they have no life.

We who have life have everything; we possess fabulous wealth. The rocks, the dead and the soil have nothing, are nothing.

Where will your road lead you, soldier? Are you going West? Are you going to Paris?

Do you know what is in the West, soldier? I shall tell you, soldier; listen.

In front of you are the English, you know that. The French and the Americans are behind them. You also know how they fire into the lines of your comrades. Perhaps they will retreat and new regiments will march ahead. Then they will fire again. Then the Allies retreat again. But the firing never ceases

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

SECURITY RESTRICTED INFORMATION

There is something else in the West. I shall tell you what this "something" is. Nobody can tell you exactly where it is, but it surely is in the West.

Your grave lies in the West.

If you march West, you can't help finding it. Possibly it is far ahead of you, behind the mountains. But possibly it is very near you, perhaps you can see it. Today or tomorrow—nobody knows. But surely, the grave lies there, as surely as does the sunset.

Do you march West, soldier? Then, we say good-by to you. All of us who live say good-by.

There are only two things on earth, the living and the dead. The difference between these two things is greater than that between friend and foe, greater than that between man and animal. It is the greatest difference in this world. With the dead one you cannot marry, to the dead one you cannot be a friend, you can't talk with him, you don't touch him. If you march West, soldier, we say good-by, we who are alive.

Men and women, dogs and birds and insects—they shall not be with you any more . . .

Soldier, farewell.

Today, you are one of us; you are one with men and women and everything that lives. You are master of the rocks and the woods and all inanimate things.

Tomorrow you march West.

Soldier, farewell.

Do you hear our voice?

Farewell.

On a mountain in Korea or in the New York studios of the VOA these questions will still be the same.

One final word of warning should be said. Intelligence must continually be reevaluated in the light of accumulating evidence. Target information from behind the screen of war or the Iron Curtain of uneasy peace is scanty at best, often slow to come, confused, or concealed. The best, the latest, the most complete intelligence is none too good, as every psywar operator has found at times to his sorrow. As von Clausewitz said, "A great part of the information obtained in war is contradictory, a still greater part is false, and by far the greatest part somewhat doubtful." Those are the conditions under which psywar asks its intelligence units to perform their daily miracle.

SUMMARY

This chapter is a spelling out of the postulate with which the chapter began, that is, that psywar requires a series of managerial decisions and that these decisions must be made (1) within the framework of policy and objectives, (2) in conjunction with operational plans and in view of operational capabilities, and (3) in the light of fullest possible intelligence about the target.

ORO-T-214

SECURITY RESTRICTED INFORMATION

SECURITY **RESTRICTED** INFORMATION

It is well to remember that psywar can never be better than policy. If policy is confused, psywar can hardly expect to be clear. If policy is faulty, psywar can hardly expect to make up for the deficiencies. If policy is short-range and opportunistic, psywar can hardly be otherwise. It is the obligation of policy makers to make sound policy, and in the longest practicable terms, and to make that available to the psywar unit; and it is the obligation of the psywar operation not to make foreign policy but to take the policy already made and translate it into symbols, messages, campaigns.

Psywar has an operational problem on two levels. The more serious problem is on the level of top planning, and it centers around the question of whether political and military planners in a country such as the United States can understand psywar and integrate it into their plans of action along with the other weapons available to them. On the more familiar level it is the problem of coordinating psywar with going operations and getting logistic support—a complex problem, but one about which the psywar operator is better able to do something than he is about the high-level problem.

Psywar needs two kinds of intelligence: basic, which aims at the most accurate possible picture of a target, and output, which is a culling of materials about the target for use in psywar messages. Likewise, there are two broad sources of psywar intelligence: the broad background of relatively unchanging fact which comes out of previous training and experience in the target area, and out of such experience distilled into reference books and files; and the day-to-day input by which the picture is kept detailed and up-to-date, this input coming from documents, prisoners, exiles and refugees, observation, secret agents, publications, and broadcasts. Let us say again that gathering and use of intelligence are topics for a separate book. We have only tried to suggest some of the special relevance of intelligence to psywar. One special caution should be repeated here: psywar intelligence, which is scanty at best and withheld as much as possible by the enemy, must be continually reevaluated in the light of accumulating evidence.

Chapter 7

**FACTORS RELEVANT TO THE
PSYCHOLOGICAL WARFARE DECISION**

We have remarked that the range of possibilities for psywar is not endless but certainly very large. There are always more campaigns to be waged and more targets to be hit than any nation can effectively wage or hit at any given time. A selection, often a highly difficult selection, must be made. Further selections must be made among themes, among media, among possible ways of expressing the message, and among the countless permutations and combinations possible in timing a group of messages.

All these decisions are complex and difficult. Each involves a large number of variables, each of which must be estimated and assigned a value despite the fact that there is not much experimental evidence or theory to which the operator can turn for guidance. Psywar, as we have said, is at the same time something less than a science and something less than an art, although it has elements of both science and art. Insofar as it is science, it puts its bets on the best and most complete evidence available, tries to function in terms of cool objective interpretation of such evidence, and looks forward to the day when laboratory and field studies will provide it with the developed theory it sorely needs. At present, however, the making of psywar decisions is mostly a matter of impressionistic or intuitive balancing of plusses and minuses of quite uncertain value. And here the experience, the skill, and the "art" of the old hand at the psywar game play an important role.

The chief decisions that enter into the planning of psywar are what campaign (what specific act, as part of that campaign?), purpose (that is, what specific response from the target audience is the objective of the campaign? of the specific act of psywar?), target, channel or channels, message (which means, how should the psywar man try to accomplish the desired change?), timing, and means of evaluation? These will be discussed in the following pages.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

DECIDING ON THE CAMPAIGN

Psychological warfare, like military warfare, is for the most part organized into a series of campaigns. These employ a group of related themes for long enough to get the greatest cumulative effect without a significant loss of interest.

Leonard Doob¹ has made an ingenious effort to develop a systematic, semimathematical way of estimating the relative desirability of different campaigns. A mathematical weighting of the kind he has in mind is perhaps not feasible in all circumstances, but when the operator goes about deciding on a campaign he must ask himself questions such as the following, and be clear in his mind as to how he is answering them:

Priority of Policy Points

What particular points of our policy and program hold highest priority at any given time? This is obviously a fundamental question, one that must be answered at the very highest levels. The obligation of the psywar officer is not to decide it but to seek direction on it.

Applicability of Psychological Warfare to Policy Points

Which of these high-priority points is it possible to reinforce with psywar at this time? Certain policies make better psywar than others. For example, Wilson's Fourteen Points made better psywar than Roosevelt's policy of unconditional surrender. For some policies and programs the timing, as of a given moment, will not be right. For example, there may be more reason to maintain secrecy on a forthcoming military movement than to build up psychologically to it. This is partly a high-level policy decision, partly an expert operational decision. But it is clear that at any given moment certain high-priority items in a nation's military and diplomatic program will lend themselves better to psywar treatment than others, and some will not lend themselves to it at all. The operator, insofar as his directives leave him free to choose, will naturally want to allocate the scarce resources to those items that promise the biggest pay-off for the smallest expenditure of time, energy, and material.

223

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONNumber of Campaigns Possible

How many of these possible and desirable campaigns can be successfully maintained at once? This again is an operational estimate, which should be made in terms of the importance and probable size of the campaigns, the facilities available for conducting them, and the capacity of the target audiences to absorb them. Skilled propagandists are always careful not to attempt too much at once. The Russians have maintained their peace campaign for two years, keeping it alive by varying the treatment; for example, petitions, international meetings, charges, counter-charges, and offers. While this campaign has been in progress, it has apparently dominated all Soviet psywar. In the meantime, however, they have developed and concluded a number of minor campaigns; for example, the charge that the UN Forces were using bacteriological warfare. The Soviet practice of concentrating on a few themes or campaigns at a time is, of course, part of the Leninist teaching, which affirms that agitation (communication to the many) should shoot the works on only a few ideas so that the masses may master them completely. The good psywar planner always has up his sleeve some possible and desirable campaigns that he is not using at the moment but will use when the moment is ripe or when the current campaigns have accomplished their objectives. The decisions as to when to taper off on one campaign and when to launch or step up the pace of another are among the most critical he is called upon to make. The following are some of the criteria in terms of which such decisions should be made.

Availability of Tools and Channels

For which of the possible and desirable campaigns are the necessary tools and channels available, and the targets exposed? The question here is, is the psywar operator in a position to deliver a campaign to the target he wants to hit? How complete, for example, is the communication monopoly in the target country? If a campaign requires airplanes, are planes available? If it requires radio, is there a signal into the country, and some evidence that it is being heard? If a campaign requires events (for example, supporting raids, or Point Four funds), is the psywar operator's government in a position to supply those events? If a campaign requires the operator to reach a special group within the target country (for example, policemen or telephone workers), has he a channel by which he can be sure of reaching them? Will there,

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

if he uses such and such a channel, be a spillover that will weaken his other campaigns (for example, will trade unionists hear and dislike what he is saying to policemen)?

Most Promising Campaigns

Of the possible and desirable campaigns, which ones are most promising in terms of their likelihood of (a) gaining attention, (b) gaining acceptance, and (c) finding conditions favorable for the desired attitude change or action? Having decided that he can reach the target, the psywar planner must now put together the best intelligence he can get regarding the target with what he knows of the proposed campaign and of his own capabilities, and estimate the chances of making the campaign a success. What has the enemy been telling the target? What does the target population know and think about the topic of the proposed campaign? If the campaign is launched at moment X, is it likely to get a fresh hearing; to interest people by touching some of their needs and wants; to gain the propaganda initiative (for in psychological as in military warfare the advantage lies with attack)? Has the enemy succeeded in building up a resistance to this particular argument or this kind of campaign? Has the psywar operator the tools it will take to gain acceptance for the message? For example, has he a spokesman who will be accepted by the target, and evidence that will be believed? And, finally, is the prognosis favorable for the attitude change he wants to bring about? In view of the present beliefs and attitudes of the target, will the desired change be a small one (ordinarily, the smaller the easier) or a great one? Will the change require a short or a long campaign? (Panic, for example, can be brought about, if at all, in a relatively short time, but habits of cooperation can be instilled only by a sustained effort over a long period. Is the psywar operator in a position to reinforce the desired change with events? Is the desired change merely a matter of canalizing existing attitudes (in which case it may be accomplished easily), or will it require a fundamental reversal of stoutly held beliefs and attitudes? (In the latter case it will be extremely difficult, perhaps too difficult to be worth trying.) Will it be reinforceable by group attitudes, or require deviance from group norms and role patterns? (In which case, again, it will be extremely difficult.) Does the desired response lie within the limits set by the culture of the target audience? Is it inhibited by surveillance?

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONRisks

In the case of possible and desirable campaigns, what is there to lose (a) in future credibility, (b) in risk to our friends, and (c) in terms of giving the enemy an opening? These are the crucial negative questions. Credibility is a valuable asset in any propaganda operation and one that is to be bartered away only when there are extremely convincing reasons for thinking that the pay-off will be big. Concretely, the operator must be sure that the advantage to be gained by fooling the enemy will overbalance the loss involved in depriving the audience of grounds for trusting our propaganda in the future. Similarly, if a campaign makes it necessary for agents, friends, or potential friends in the target population to reveal themselves, or exposes them to the risk of retaliatory action by the enemy (imprisonment, confiscation of property, execution), then the planner must think a second or third time about whether it is worth undertaking. The presumption, of course, is always against such a campaign, although here, as with credibility, we must not think, as some current writing on psywar urges us to do, in terms of absolute prohibitions: never misrepresent the truth; never expose a friend to retaliatory action. The most we can say is this: Calculate carefully the probable costs and the probable gains and be mighty sure the latter are big enough to justify the former; if they are, go ahead and do it. This applies equally to the supposed rule of never giving the enemy an opening for his counterpropaganda. If by the time his counterpropaganda can be got under way this country can pick up the blue chips, the psywar operator needn't worry about the counterpropaganda.

The selection of a campaign is rarely so systematic as the preceding questions perhaps make it appear. Yet the questions to which we have directed attention do have to be raised and answered if psywar planning is to make sense. The planner is informed that campaigns A through J enjoy the highest priority in the minds of the nation's policy makers. Of these he knows that all except J will lend themselves to psywar treatment. At the same time he feels that he can maintain no more than four campaigns, say one major and three minor ones, at this time. Somehow, therefore, he must reduce his nine campaigns to four. He eliminates campaign I because the indicated target is not readily exposed to the kind of channels and facilities he has available. He then estimates the remaining campaigns in order of the likelihood of their succeeding. Campaign H he eliminates because it would lose him the credibility of the target audience, which he expects to need in later and more

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

important campaigns. Finally he selects campaigns A, B, C, and D as the most promising among the survivors.

The difficulty of this decision, as you will readily see, is that it must be based (a) on intelligence that is always less than a complete picture of the audience, (b) on a body of communication theory that is far from complete, and (c) on a balancing of elements that are not always strictly comparable. The last is especially bothersome. The planner must decide whether the fact that he has better channels and facilities for campaign X does or does not overbalance the fact that the target audience for campaign Y is likely to be more receptive. He must decide whether the somewhat greater ultimate importance of campaign M overbalances the considerably greater likelihood of success in campaign N. He must decide whether success in campaign R is worth losing the trust of the target audience, to which he might later want to direct campaigns S and T.

It is here that the experience and art of the planner tend to come to the fore. When the decision is close he will have to make the same kind of leadership decision that Dwight D. Eisenhower faced on June 4, 1944, when he sat alone on the coast of England with an invasion army ready and a weather forecast that was unpropitious for a seaborne invasion, and had to decide whether to postpone D-Day for a month or risk possible disaster.

DECIDING ON THE PURPOSE

The process of planning psywar is a matter of a progressive sharpening of a plan in terms of given goals and objectives. High-priority national policies tend to have very broad objectives, such as the military defeat of country A or the counteracting of Communist influence the world over. Within such a policy, existing military plans may call for the capture of island B, for example, so that a highly desirable psywar campaign might be aimed at reducing the will to resist of enemy soldiers on island B. Within that campaign, addressed to a subordinate objective, there may well arise a number of objectives subordinate to the subordinate objective. One such objective might be the privatization of enemy soldiers. The psywar operator might try, that is to say, to turn their thoughts to their own hardships and problems, by way of softening them up for attack or invitations to surrender. Or he might try to encourage subversion, and to that end he might try to turn the soldiers against their immediate officers. Late in

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

the game, but only late in the game, he would presumably invite them to surrender. Further sharpening occurs as messages bearing upon these objectives are tailored to particular targets within the target. Let us suppose that once the invasion is under way a large group of the enemy is isolated in a strong defensive position. They can't hope to fight out of it, but they can hold up the US advance a long time and cause many casualties. The momentary goal of psywar planning must be to secure the submission of these men, with, of course, minimum losses for this country. But let us suppose further that discipline in the surrounded enemy unit is strict and group morale high. There is reason to think that only the commander has the power to surrender his garrison; at least for the present, then, it will be useless to appeal to the men individually. The message, therefore, must be addressed to the commander, although if this is not successful the psywar operator may have to try to bring about subversion among the men. He assigns a loudspeaker—perhaps a "talking tank"—to speak to the isolated enemy unit. And as he prepares the series of messages for the talking tank, he has in hand a problem that has assumed very sharp outlines indeed. For the objective of the messages he is preparing is now to stimulate target C within the target (the enemy commander) to make response D (surrender of such and such men) for enemy unit E on island B at specific time T.

When we speak of purpose in psywar, therefore, we usually mean the specific objective, that is, the actual response we want from the particular individuals who are to receive a given message or related series of messages. The message, be it noted, cannot be constructed without a clear definition of purpose, and purpose, on this level, is dictated in large part by the peculiarities, situational and/or cultural and/or psychological, of the particular target. And there is further sharpening as regards the medium or media that will carry the message to the target. Thus, operational planning for psywar is a fourfold operation, in which none of the four elements—purpose, target, media, message—is completely master. It may be helpful to look at some of the interrelations of these elements. Let us, for example, consider the matter from the standpoint of purpose.

To begin with, purpose is restricted by certain limits set by the response that may be expected of the target. It would be futile to expect a grass-roots revolution from a people whose culture has taught them only submissiveness, and whose power elite ruthlessly eliminates every potential counterelite as soon as it

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

appears. Or the response may be a possible one, but the time may not yet have come for it. Surrender responses can hardly be expected from, for example, a victorious army, even if it is known its individual members are capable of surrendering when the going is tough. For the moment, all the psywar operator can do is plant the seeds of surrender, in anticipation of the day when his country shall have turned the tables on them militarily.

Similarly, purpose is limited by what may be said to a given target in a given message or series of messages. This limitation may be physical and have to do with length (for example, an airborne loudspeaker can hope to get across a sentence but not a paragraph or, for that matter, even a very long sentence), or it may be a limitation on subject matter imposed by policy makers topside. For instance, during World War II the policy restrictions on what might be said about the Japanese Emperor made it impossible to implement any purpose that had to do with destroying the Japanese people's faith in their highest leadership. Or the limitation may have to do with the ability of the target to receive a given kind of message; for example, a primitive people could hardly be expected to respond to complicated ideological conversion propaganda.

Purpose is also limited by the media available for reaching a projected target with a given message. For example, during the last war the inhabitants of certain concentration camps and forced labor groups would often have been ideal targets for psywar with a revolutionary purpose. But often also there was no way to reach those prisoners by mass communications.

Similar intereffects may be observed in connection with the other elements as well. Thus, choice of target is obviously governed by purpose. If the purpose is to foment dissatisfaction with leadership, the psywar message is aimed at those followers who are most likely to be receptive to such material and most likely to respond in the desired way; or to the leaders, with the intention of encouraging them to act in a way that will dissatisfy their followers. Choice of target is likewise governed by the availability of media to reach a given target: the moment may be ripe, according to psywar intelligence, to hit an enemy unit on such and such a hilltop, but if the psywar operator cannot, for whatever reason, get at it with his leaflets and loudspeakers, and leaflets and loudspeakers are all he has, then he must pass this target up in favor of some other one for which the moment is less ripe. Choice of target is restricted also by the possibility of constructing a suitable message to a given target, which is a

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

matter of its literacy level, customs, symbolism, and frame of attention.

Each message, in the same way, is put together with a constant eye to the fact that it is an arm of purpose. One of the commonest failings of inexperienced psywar practitioners is to permit themselves to be drawn away from their main purpose, into arguments with the opposition's psywar. Thus, early in World War II some Allied broadcasters boasted gleefully that they had made Goebbels "furious," although if pressed they would have had to admit that their real purpose was not with Goebbels at all and that, as far as real accomplishment was concerned, most of their cleverness had been wasted. But if the message is constructed to fit the purpose, it is also tailored to fit the target. It must gain their attention, must be expressed in symbols they understand, and take advantage of their predispositions. And, finally, it must fit the medium or media to be used. Radio imposes restrictions on a message different from the restrictions imposed by print. A poster or a magazine can carry some messages that would be out of the question in a loudspeaker broadcast. Leaflets ordinarily cannot carry up-to-the-moment news, but radio can.

And as the availability of media influences purpose, target, and message, so do purpose, target, and message influence choice of media. For example, the decision to use medium A rather than B or C should reflect a judgment that A is better adapted to the purpose in hand than B or C. If, for example, the purpose is to persuade a surrounded enemy unit to surrender, loudspeakers or leaflets or both will ordinarily be used, not books, magazines, or motion pictures. And there are, of course, medium choices much more subtle than that, as, for instance, the choices between the explanatory power of a picture or a diagram, the analytical power of straight printed prose, or the emotional and suggestive power of speech, and the reinforcement these can give each other when used in various combinations. Media are chosen, furthermore, with a view to getting the fullest and most economical coverage of the immediate target. An illiterate populace calls for pictures and the spoken media, not print. A submissive populace must be reached, in the main, through channels that lead first of all to an elite. A given group of leaders like any other audience will have a frame of attention that some media will be more likely than others to penetrate. The problem is to find the right channel or right combination of channels. Finally, media are chosen so as most effectively to carry the desired message. As the nature and requirements of the medium affect the way the message is

SECURITY **RESTRICTED** INFORMATION

The problem is to find the right channel or right combination of channels. Finally, media are chosen so as most effectively to carry the desired message. As the nature and requirements of the medium affect the way the message is

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

constructed, so the intended nature of the message affects the choice of medium. If the message is to be long, it can't be put on a leaflet or spoken over a loudspeaker. If it attempts to explicate a tactical situation, it will probably require a map and therefore have to be in print. The more timely and urgent the message, the more likely it is to be communicated by radio or speaker.

The interrelations the operator has to consider have merely been suggested in the preceding paragraphs. The points to grasp about them are that they are highly complex and yet derived from a single basic idea: the psywar planner must drive a four-horse team, every horse of which must pull its weight. In psywar it cannot be supposed that a message will necessarily be effective with target A because it has worked on target B, or effective via medium C because it has been communicated effectively via medium D. Target E, though ready to explode, is not the right target, for the moment anyhow, unless channel F is available for igniting the explosion. Message G would go best by ground loudspeaker but must be printed because no skilled loudspeaker team is available. Purpose H, though laudable, may be inappropriate, untimely, and even dangerous when viewed in the light of target, message, and media possibilities.

CHOOSING THE TARGET

Purpose, then, derives from objective and objective from policy, but it should also be thought of as inseparable from target. The question that should always be in the back of our minds when making decisions about both purpose and target is this: What process of attitude formation or action within the target society would have to occur in order for us to accomplish the desired objective? This is the crux of the whole process of planning psywar. From his available intelligence, from his basic knowledge of the political and social structure of the target state, the planner must construct the best possible working model of how decisions are made and how change takes place within the given society. If, for example, his objective is to bring about surrenders by enemy troops (as in the previous example), he must decide whether discipline in the enemy army is so tight, and the particular unit of the enemy army so cohesive, that surrender can be accomplished only by the opposing commander. If the target is a whole society, and thus made up primarily of civilians, the psywar officer must

ORO-T-214

231

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

decide what segment or group of the populace has it in its power to make the desired change, or cause it to be made. In a totalitarian state, for instance, the chances are that only the top elite can do either: a dictator can formulate policy, even on life-and-death matters like peace and war, even if he has only a small part of the population really behind him. In Hitler's Germany, according to the estimate of H. V. Dicks,² which is given in detail later in this section, a bare 10 percent of the population were real Nazis, and only about 35 percent were even so much as actively sympathetic with the Nazi cause. The same percentage figure, or even a smaller one, turns up repeatedly in analyses of Soviet satellite states (Gromyko once boasted to a US diplomat that only 6 percent of the population of Romania were supporters of the people's democracy, and that that was enough—in the twofold sense that the Soviet Union neither needed nor desired more extensive popular support). The reason is, of course, that in a totalitarian state it is almost impossible for a counterelite to come into being, and much more nearly impossible for one to come into power. Where the target is a genuine police state, the psywar operator must face clearly the question whether anything at all can be accomplished by psywar addressed to the general population, or even to potential counterelites. He must, that is to say, arrive at a hard-headed calculation as to what groups are in position to receive psywar messages and to do something about it. Where, in the given state, does the power of change lie—not necessarily right now but at least within the foreseeable future? What are the groups whose interests most noticeably diverge from the interests of the party in power? Within leadership itself, what are the interests and divergences that are most likely to lead to change in the desired direction? Where, within the groups that have some power of response and action, can the rewards of a desired change be convincingly presented? There will be found the targets.

Targets may be enemies, friends, or neutrals, according to what kind of psywar is being planned. The purpose may be to make the target population better friends or weaker enemies, or to direct their action in a way advantageous to us.

Targets may be the entire populations of countries; more often they are groups within those populations. In selecting targets within targets, the psywar planner deals with societies that are capable of being "broken down" in several ways. Any society will have its formal and institutional groups, some of which have been mentioned in an earlier section. These are the power groups (for example, the political elite, military officers), the economic-interest groups

SECURITY **RESTRICTED** INFORMATION

(for example, farmers, air force), and the common-value groups (for example, religious groups), many of which are institutionalized into churches, unions, associations, etc. This is the breakdown most often used in psywar, whose operators have long since learned the value of the most detailed breakdown that can be had. For some purposes, to be sure, it is sufficient to distinguish the elite from the mass, or the farmers from the city people. But psywar has some missions that begin to be feasible only when we have separated out minority religious and ethnic groups and divided up the population in terms of its skills and responsibilities. In a modern war, specially skilled groups such as engineers and technicians may, as we have noted above, prove highly rewarding targets. In Korea, for example, the invading Communists paid special attention to, among others, communications workers, social science teachers, and physicians.

Another important kind of grouping, as we indicated in Chap. 4, is into classificatory and functional groups (for example, farmers as a classification, the National Grange as a functional grouping).

The psywar operator must think of his target population as also organized into a complex system of interpersonal relations. Among these the relation of opinion leaders to the rest of the population is especially important. When a communications specialist studies a community he always asks, "What are the authority points?" by which he means, Where do the people go for leadership in making up their minds on key issues? What newspapers do they trust? More important, what individuals do they seek opinions from? In consolidation psywar especially it is important to identify these opinion leaders; theoretically the primary target of such an operation might well be a single individual, who, once he was convinced or persuaded, would bring the rest of the target over as a matter of course.

The most obvious of the various breakdowns of target audiences that psywar can use is that into local communities, or, in military psywar, into units. Psywar may address a message to a single city that is in the path of an advancing army or a bombing run, or to a single military unit that is defending a desired objective. The population of a local community, of course, has a common interest stemming from the mere fact of living in the same spot; if one of them is bombed the chances are all of them will be bombed; if the local high school is totalitarianized, it means impoverishment of an educational institution to which all of them send their youngsters. A local community can, of course, be broken down into the formal and informal groupings mentioned

SECURITY **RESTRICTED** INFORMATION

above. It has its power groups, its interest groups, its value groups, and its functional groups. It has its opinion leaders. Any given individual in the community may belong to any number of these groups. Perhaps he belongs to an economic-interest group, to a value group, and to two functional groups, whereas his next-door neighbor's memberships fall into an entirely different pattern. He will have certain persons with whom he usually talks over political problems, and there are identifiable persons or institutions on whom he relies for guidance in making up his mind. For example, one receiver of psywar might be an individual who belongs to no identifiable elite, is a member of the unskilled laborers group, is a staunch Roman Catholic, confines his talking about politics to his place of work and the neighborhood tavern, and depends chiefly on his parish priest and his union newspaper to guide his political decisions.

The fact that communities are so organized is highly important to the psywar operator, since it means that several channels lead to every individual in the target audience. The hypothetical man we have been talking about may be reached first of all through general propaganda directed to the community, then through propaganda directed to the special attention of the laboring group, then through his church group, then through the religious leaders and labor leaders, and perhaps through yet other channels that we have not mentioned. This means, among other things, that propaganda messages sent through these various channels must be planned in recognition of the fact that two messages intended for different groups may well reach the same individual, who if he hears very different things from the same source will quickly learn to distrust it. It also means that there are endless possibilities of reinforcing psywar effect by repeating and timing messages through different media to different though related targets. It means, finally, that a skillful psywar operator can supplement his generalized mass propaganda with specific propaganda addressed to key groups and opinion leaders and thus achieve an effect far beyond that to be expected from a shotgun approach.

In tactical psywar the choice of target may be somewhat simpler than the above example suggests. Military targets, as noted above, are often defined by sheer geographical location. The desired response may be simple and common to all members of the target, as is the case in surrender-mission psywar. There may, that is to say, be no need to take into account groupings and relations within the military unit. But even in tactical psywar to a single unit, such breakdowns as will permit directing messages that will

SECURITY RESTRICTED INFORMATION

exploit tensions and jealousies between officers and men, or between groups which feel themselves unequally treated, or between groups with different ethnic or religious or regional backgrounds often prove useful.

Wise selection of a target for a particular message, then, is always a matter of the operator's coming to an understanding with himself as to what grouping within the audience can and should be reached with it. This group's members will have certain common characteristics, and it is in terms of these that the psywar addressed to it will appeal, and seem important, to all of them. And it will have been selected, in part, because of their common ability to respond, if the psywar is successful, in the way designated by the purpose. Hence in order to be as sure as possible that the psywar will succeed, the psywar operator will try, at the planning stage, to delineate his target clearly and fully.

Careful delineation of the target is more necessary in psywar than in, say, domestic propaganda, because of the target's very remoteness. To take the other extreme, in face-to-face communication the operator can watch every reaction of the target and constantly readjust his aim to it. In communication mediated through newspapers, magazines, or radio in the operator's own country, the sender has numerous opportunities to establish actual contact with his audience, and has, at least in the United States, Britain, and a few other countries, a highly developed system of audience research. The latter's function is precisely that of spanning the gap between the sender and his listeners or readers (which, we repeat, is much narrower than that which confronts the psychological warrior); it tells the editor or program director who are in his audience, what they select from the material he gives them, and what they think of what they select. In psywar, however, such machinery or indeed anything remotely like it is seldom available. The communication is to a foreign culture, to which the communicator is, in many cases, denied access of any kind, and with which he is likely to be less than fully familiar. If the target is an enemy country, every effort is made by its government to keep the psywar communication from reaching the intended recipients to begin with and, in any case, to conceal or even misrepresent the reactions of those who do receive it.

Thus every slightest bit of information about the target is precious to the psywar operator, which is why both knowledge of the target culture and adequate day-by-day intelligence from within the target are indispensable to a sound psywar operation.

SECURITY **RESTRICTED** INFORMATION

In the course of choosing his target, constructing a message, and selecting media to carry it, the psywar planner will therefore make every effort to piece together a "profile" of his target, or what Linebarger³ calls a picture of the "propaganda man." Here are some questions the profile must answer: What kind of person is the psywar message going to? Who is the man at the other end of the circuit? What does he want out of the message he listens to? What are his reasons for listening? What are his attitudes on the topic under discussion? What does he believe in? Whom or what does he trust? What in general are his motivations for doing what he does? In what ways do his needs and wishes diverge from the pattern his government has set for him? What symbols are emotionally meaningful and moving to him? What are his group relations? What roles has he learned to play? What is he capable of by way of response? Can he be expected to take action against his leaders or even to develop negative attitudes toward them? (It was the general consensus of informed persons in World War II that the German people could not be expected to develop negative attitudes toward Hitler, or the Japanese against Hirohito.) What response, then, can he be expected to make (for example, suspicion, malingering, complaint, defection, surrender) that will be to the advantage of the communicator? Information like this is, of course, the result of continuous gathering and interpreting of intelligence. The psywar operator will therefore comb the intelligence available to him and make every effort to fill out his picture of his audience, to assess the strengths and weaknesses of his targets, and to discover ways and means of exploiting them.

Here, for example, is a section of the standing directive for psywar against members of the German armed forces, prepared in June 1944 by Richard H. S. Crossman,⁴ then deputy chief of the psywar division of SHAEF. Crossman, of course, had had the assistance and advice of General Robert McClure and other key men in Allied psywar. The document is of great interest to us at this point not only because it is an excellent example of sound psywar staff work, but also because it is essentially a delineation of the propaganda or target man. The directive reads:

Note: Except where specifically stated, the following generalizations apply to the German Army, not to the Air Force or Navy. (Note: A distinction is made between the targets within the target.)

12. Strong points

- (1) *The Habit of Discipline.* The habit (Note: "Habit" as clearly a cultural and not situational peculiarity of target.) of uncritical obedience to authority, rather than any ruth-

SECURITY **RESTRICTED** INFORMATION

less enforcement of discipline from above, remains the strongest factor in German morale today. This factor may not decrease sharply until the German Army as a whole is broken on the battlefield (*Note: Prediction of future target reaction*), since the retreats and defensive battles to which the Wehrmacht is now committed automatically place greater reliance on higher authority than offensive campaigns of the 1940 type.

- (II) *Comradeship*. The ideal of comradeship has been keenly cultivated in the German Army, particularly since 1933. The German NCO forms a transitional stage between soldier status and officer status, a fact which strengthens this sense of comradeship. It has furthermore been immensely deepened by the Russian campaign. (*Note: Data evidently obtained from current intelligence, not previous knowledge of culture.*)
- (III) *Professional Pride*. The average German's conviction that the best life is the soldier's life, plus the social fact that the highest calling in Germany is the soldier's calling, constitutes a great source of strength. (*Note: A further cultural datum.*)

Added to this (*Note: Further drafts on current intelligence*) the German soldier, and often the non-German soldier serving in the Wehrmacht, is convinced:

- (a) that he is privileged to be serving in the finest army in the world, permeated with a code of soldierly honor which rules him and his officers alike;
 - (b) that the Wehrmacht is the embodiment of the highest physical and spiritual attainments of German culture;
 - (c) that the Wehrmacht is therefore the *nonpolitical* guardian of the future of the German race;
 - (d) that, as a fighting machine, German "quality" can probably succeed in throwing back both Anglo-American and Russian "quantity." (*Note: Emphasis on axioms characteristic of mentality at which psywar messages must be directed are emphasized.*)
- (IV) *Material Interests*. The German Army represents, for the reasons stated in subparagraph. (III) above, an honored career with considerable material benefits. (*Note: More current intelligence.*) (Pay allowances and especially food are good compared with civilian standards in Germany.) Thousands of officers (especially those of junior and field rank) and tens of thousands of NCO's (particularly in specialist trades) have signed on not simply for the duration, but for periods varying from 7-14 years, or longer, and are fighting not only to preserve the German Army as a war machine, but as a means of livelihood.
- (V) *The Bolshevik Bogey*. The guilty fear of Russian vengeance, linked with the Teuton dislike of the Slav and general fear of Bolshevism, has convinced the average German soldier that "anything is better than the defeat in the East." (*Note: Emphasis on guilt feelings, as mechanism relevant to psywar's task, and on a high-priority need of target audience.*)

German propaganda has deliberately enlarged and intensified this fear, in the following ways:

- (a) It has largely succeeded in persuading the soldier that the Anglo-Americans are so dominated by the

SECURITY **RESTRICTED** INFORMATION

Bolshevik Colossus that they would be powerless to save Germany. (Note: Current intelligence again, with further clarification of propaganda men's attitudes.)

- (b) It has filled the gap created by the absence of specific United Nations policy on Germany with atrocity stories of forced labor in Russia, castration, deportation, etc.
- (VI) *The Rewards of Victory in the West.* Learning from Mr. Churchill in 1940, the High Command has deliberately capitalized the threat of invasion from the West. It has:
 - (a) argued that, if the Anglo-American threat can be frustrated or confined, the German Armies can be switched to the East. This argument has been used to justify the retreats in the East.
 - (b) argued that a defensive victory in the West will form the basis for the speedy conclusion of a "compromise peace" either with the West or with the East, which would in fact be a German victory. (Note: Sketching in of domestic propaganda context into which messages will be sent and further delineation of profile are sketched in.)
 - (c) exploited the bombing of Germany to persuade the soldier that his only hope of regaining what he has lost lies in a German victory in the West.
 - (d) succeeded in convincing the German soldier that for these reasons one last tremendous effort must and can be made.

(VII) *Summary*

- (a) Taken by and large, it must be accepted that the German High Command has rendered the Army largely immune to the two Psychological Warfare campaigns which proved effective in 1918, i.e., Bolshevik propaganda, leading to soldiers' and workers' councils; and democratic propaganda, leading to a revolt of the civilian under arms against the professional soldier. (Note: Emphasis is on attitudes sure to be highly resistant to change.)

We should assume that the German Army in the West will, like von Arnim's Army in Tunisia, fight on as a whole until it collapses as a whole. (Note: Emphasis is on difference in attitude between the elite and the rank and file.) Indeed defeatism is more widespread at the top than at the bottom.

- (b) The High Command has succeeded in actually raising fighting morale during the winter. (Note: More current intelligence.)
- (c) For the reason outlined in subparagraph. (I) above, no propaganda directed at the frontline German soldier is likely to be effective unless it sounds and looks more positive and authoritative than his own Army Order forbidding him to listen to it. (Note: Recognition that special effort is needed to overcome strongly held attitude backed up by group sanctions and leadership.)
- (d) For the reasons outlined in subparagraphs. (II) and (III) above, there is little prospect of dividing the German Army internally—i.e., setting men against

SECURITY **RESTRICTED** INFORMATION

officers. (Note: Emphasis on attitudes likely to resist change altogether.) Furthermore, no propaganda aiming at inducing the surrender of German troops is likely to succeed unless it meets the fundamental objection that by surrender the individual is letting down his comrades.

13. Weak Points

- (1) *The Shaken Myth of Invincibility.* The long series of defeats suffered by the Wehrmacht in the Mediterranean and in Russia have shaken—but by no means shattered—the German soldier's faith in the mystic invincibility of German arms which carried his fighting morale up to a high tide of fanaticism in June 1940. (Note: Emphasis here, and in following sections, is on anxieties of target audience.) Within this general uneasiness are other specific doubts:

- (a) *Doubt about the Führer.* Allied propaganda that disasters such as Stalingrad, Tunisia, the Ukraine battle, and the Crimea were largely due to the prestige policy of hanging on too long to too much, has gone home. Many German soldiers today feel that military operations are being dictated by political and often party considerations. The permeation of the OKW, and of the General Staff with party generals (notably the C. of S. Zeltzer) is largely blamed for this. (Note: Use of scapegoat mechanism.)

Note: At present, the average soldier, despite an awareness that he has made serious mistakes, is not inclined to blame Hitler, as the generals and other informed persons already do. (Note: Implied warning that propaganda attacking Hitler is unlikely to be effective.) Hitler is still his lucky talisman. Goering is also to some extent shielded. Of the German leaders, Himmler, Goebbels, and Ley are the most unpopular. Generally speaking, "The System" or the "Party bosses" are the commonest scapegoat.

- (b) *Doubts about Equipment.* German Army equipment is good and the German soldier knows it. But his battle experience since 1941 has given him painful proof that, in some respects at least, Allied equipment is not only more plentiful, but better. (Allied MT in Africa, Russian PAK, Russian medium tanks in the East and Allied fighter planes on all fronts are examples.) (Note: Anxiety.)

The present "Wanderwaffe" vogue is in part a wishful-thinking reaction to this.

- (c) *Doubts about the News.* Despite intense efforts by the High Command, it has not succeeded in making the German soldier accept unquestioningly its interpretation of events. Most German soldiers, when they get the opportunity, read or listen to Anglo-American propaganda and try to find a truth half-way between their own communiques and ours. They assume that "everything is propaganda" and that they, as intelligent people, can read between the lines. Without knowing it, they are of course steeped in Nazi propaganda. They regard as "propaganda lies" such facts as that Germany invaded Poland, or that England has some highly developed social services. They have the useful faculty of forgetting any facts inconvenient to their superiors, and believing they were invented by Anglo-American propaganda. Their outlook is formed,

SECURITY **RESTRICTED** INFORMATION

however, not by the direct output of the Propaganda Ministry, but by the educational and propaganda activities of the Wehrmacht. Nevertheless they are open to any propaganda which does not sound or read like "propaganda," and does not offend their sense of "soldierly honor." Unconsciously still, but actively, the German soldier craves for an excuse to stop the useless slaughter which leaves his honor as a German soldier unscathed, and puts the blame on someone or something outside the Wehrmacht. (Note: Emphasis on search for rationalization and for a new scapegoat.) He needs, in brief: (I) facts which seem to him to be objective showing that, despite the courage of the Wehrmacht, someone at home has lost the war for Germany; (II) a picture of the future which portrays death and destruction for "the betrayers of Germany" and survival for the German people.

Evidence for the above analysis is provided by the growing success of: (a) Free German Committee broadcasts from Moscow, headed by General Seydlitz, and (b) Radio Calais. Both these transmissions seem to assume an analysis of German fighting morale similar to that above.

- (d) *Doubts about the Luftwaffe.* Moreover, the Air War brings with it a cause of friction between the Air Force and the Army. German soldiers are beginning to talk like many British soldiers in 1940. This friction, and the resulting blame on "the authorities" is a real if minor chink in German fighting morale. (Note: Emphasis on potential dissension among German armed forces as psywar vulnerability.)

All these factors are important, in that they provide the soldier with scapegoats for his decline in fortune, and when things go wrong the German's natural reaction is: "I have been betrayed."

- (II) *Manpower.* This is perhaps the main operational worry of the German soldier. He is disturbed by the enormous losses in men and material which he knows the battles in Russia have cost the Wehrmacht. (Note: More anxieties.) This uneasiness is heightened by the Allied propaganda barrage on this theme, contrasted with the silence of his own authorities, a silence all the more significant when it persists even under the new OKW policy of simulating complete frankness on operational matters. This general manpower worry breaks down into other specific ones:

- (a) The worry that, because of manpower troubles, the ranks of the Wehrmacht are being increasingly filled with foreigners of some twenty nationalities, and that the quality of the army is therefore in danger of "pollution."
- (b) The worry that, with almost every one of its field divisions committed already to actual or potential battle-fields, the German Army has no effective central reserve to sustain it.

Both (a) and (b) above apply with particular force to the target of this paper--the German forces in the West. (Note: Sharpening of target.) These troops have in their own formations large numbers

SECURITY **RESTRICTED** INFORMATION

of foreigners; and most of these divisions have had proof, by their own experience of being switched from West to East and back, that no uncommitted central reserve exists. The great volume of German counterpropaganda on this point is further evidence of its importance.

- (III) *A War Gone Wrong.* In building up the picture of the chivalrous Wehrmacht in deadly battle against Bolshevism, the High Command inevitably raises in the German soldier's mind the question why Germany is fighting Britain and America, especially since Hitler denounced in *Mein Kampf* the fatal mistake of the two-front war. The High Command seeks to answer this question by denouncing Anglo-American impotence and arguing that the Jews of Wall Street and the City of London are in conspiracy with the Kremlin. But this argument does not quell a deep uneasiness.

There is also a feeling in the German soldier's mind that the defensive battles which he is now forced to fight are not the battles for which he was trained, nor the battles for which his equipment was designed. There is evidence that the OKW had great trouble, during 1943, in converting officers and men to the technique of the defensive battle which their previous training had largely neglected.

The fear of isolation, a feature of what the Germans used to ridicule as "Magenot-mindedness," is likely to be at its strongest among coastal formations in the West. They are particularly liable to the anxiety lest they be sacrificed as "human landmines." (Note: Further sharpening of the target.)

- (IV) *Loss of Honor.* An increasing number of soldiers are aware of, and uncomfortable about:

- (a) atrocities, especially in Russia. They naturally want to push the blame onto the SS, or simply "those in authority."
- (b) the hostility of the occupied territories, including "Nordic" countries like Norway. The German wants to be liked, and the German soldier is puzzled why, despite the correctness of the Wehrmacht, he is so coldly received. He wants to have an explanation which blames someone outside the Army for this failure of the "New Order." (Note: More emphasis on scapegoat mechanism.)

- (V) *Respect for Western Powers.* The German has a sense of inferiority to both Britain and America. (Note: More cultural data.) Many Nazis, for instance, regard National Socialism as the method of making Germany a ruling race "like the British." The German feelings for Britain are a confused mixture of envy, respect, and contempt for the old-fashioned. Their feeling for America is different, since they do not feel toward it a racial unity like Britain or Germany, and are suspicious of its "capitalist imperialism." They profoundly respect its riches, production capacity and "smartness," and regard it as the continent of unlimited possibilities.

Intensive propaganda has failed to modify these traditional feelings. (Note: More current intelligence.) In particular, nearly all German soldiers are confident that

SECURITY **RESTRICTED** INFORMATION

they will be treated well as prisoners of war and hope for (if they do not expect) an Anglo-American occupation if the worst comes to the worst. Furthermore, they are feverishly anxious for Anglo-American appreciation of "the chivalry" of the Wehrmacht.

- (VI) *The Shadow of the Two-Front War.* It is improbable that German fighting morale in the West will be seriously undermined before a successful Anglo-American landing, provided there is no great German disaster in the East. But the moment we can announce a decisive breakthrough will be a moment of profound psychological crisis, greater even than the shock of Mussolini's collapse last year.

Meanwhile, the advance of the Russian troops into Europe must reduce the persuasiveness of the argument that Hitler is deliberately yielding space in the East to ensure victory in the West. Gradually the German soldier begins to ask whether Hitler's strategy is not precisely what United Nations strategy desires, and whether the Second Front is not having its effects even before it starts.

The Allied psywar officers were able also to make use of a penetrating analysis of German political attitudes, made on the basis of POW interviews and related sources by the British psychiatrist H. V. Dicks.² This analysis dealt with German males of military age, but from it the Allied officers could make a fairly confident extrapolation to the older people and to the female population. Here is Dicks's breakdown, as revised and developed by the authors of this volume:

Hard-core Nazis (about 10 percent of the population of this age group)

Idealistic zealots—the Rudolf Hesses and Alfred Rosenbergs of the Party

Party toughs—the gangster types such as Julius Streicher and Robert Ley, devoted more to the excitement of gangster activities than to Party ideas

Concealed fanatics—the Heinrich Himmlers, who found in Nazi ideas and brutalities a release for their own private frustrations and fantasies

Modified Nazis (about 25 percent)

Pseudo doubters—who take the authoritarian pattern for granted, defend the regime as a whole, but condemn certain acts such as atrocities and anti-Semitism

Idealists—the Baldur von Schirachs of Germany, who thought of Hitler as a glorious leader, and of Naziism as a glorious vision which mortal men had not quite been able to carry out

Cynics—those who have profited by association with Naziism, and thus feel they must sink or swim with it.

SECURITY **RESTRICTED** INFORMATION

but are likely to become renegades when they see the prospects are hopeless

The Unpoliticals (about 40 percent)

Rural people—including most of the rural population of Germany, who were concerned with their own land and living

Village artisans—the old-world German, sticking to his work, largely unconcerned with politics

Minor officials—professional public servants, willing to work for any regime, playing it safe with the Nazis

Professional soldiers—who shared the concern of the minor officials for job and pension, and in many cases showed a far deeper loyalty to the Wehrmacht than to the Nazi state

Passive Anti-Nazis (about 15 percent)

Disillusioned idealists—attracted at first by the fine words and sentiments of the Nazis, later repelled by the violence, broken pledges, and losses

The middle-aged—who wanted peace and security more than anything else, and had turned hopefully to the Nazis after the difficulties of the Weimar Republic, but had found only unrest and war

The very young—who had missed the excitement of the first Nazi years, and had found Hitler Youth monotonous rather than romantic

The opportunists—who had accepted Nazism out of career-making motives, then found themselves in danger of losing all status, and acted thereafter out of self-interest and caste-loyalty

Active Anti-Nazis (about 10 percent)

Political Anti-Nazis—ranging from the National Conservatives to the Communists

Religious Anti-Nazis—some Roman Catholics and Evangelicals

Individuals—who for reason of family background, intellectual training, or foreign experience, could not accept the tenets or policies of the Nazis

On the basis of these and other analyses, the Allied psywar campaigns could be directed with some confidence at specific targets within the target (that is, the Reich). As the war drew to an end, the picture of the German public was constantly revised on the basis of changing intelligence and disillusionment, political

ORO-T-214

243

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

apathy, weariness, and fear on the part of the people at home began to loom ever larger in the target sights of the psywar officers. The Wehrmacht began to display the characteristic of most modern armies, that is, the lack of training for and inability to adjust to defeat. Thus a decline in morale presented better and better targets for psywar, and in each group the momentum of the decline could be accelerated by appropriate themes, themes to convince the modified Nazis that they were supporting a lost cause, themes appealing to the unpolitical's wish for renewed security and order, themes to convince the passive anti-Nazis that they had been betrayed, to give the active anti-Nazis hope and an outlet, to encourage in these ways the desired responses.

A study of Communist personality types in Czechoslovakia, made in 1948 by an anthropologist, is another illustration of the kind of target analysis that the practitioner of psywar will find useful. It was estimated that the active Communist groups represented less than 10 percent of the total Czech and Slovak adult population. In general the Communists had apparently joined the Party for reasons linked with their personal needs for security, status, and emotional satisfactions. Their unwillingness to merge themselves into the population as a whole and to identify themselves with their fellow human beings was impressive. They wanted not merely approval but adulation. It appeared that most of them disliked the so-called capitalist class, as represented to them by the Communists, only somewhat more than they did the Russians themselves. They were said to have had less self-confidence than most non-Communist Czechs and hence would find it easier to adjust to a Communist society in which they would have status than to a competitive one in which there would be little interest in them as individuals.

Most of them got a good deal of satisfaction out of their identification with the Party and, through it, with Russia and Communists all over the world. They felt, as Communists, a sense of importance, an identification with a numerically large group, a feeling of riding the waves of human destiny, and of having a body of answers as to what is wrong with the world.

The Czech Communists inevitably became strongly hostile to the United States. Because the Communists could enjoy a feeling of well-being only so long as their hopes of Communist world domination were going smoothly, the constant frustration of these hopes brought about by US foreign policy, Marshall Plan, and military actions induced powerful resentment against the cause of these frustrations. This resentment was expressed in unceasing exaggeration of American faults and belittling of American virtues.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

The Communists identified themselves so completely with totalitarian aims that every hindrance to the "legitimate aspirations of progressive mankind" became for them a personal humiliation.

Even within the 10 percent of the population who were Communists, five distinct groups could be identified. These were:

The "fanatics," the ultra-loyal core.

The "idealists," who remained loyal despite misgivings, hoping that Communism would build a better world.

The "pan-Slavists," who tended to subordinate Party policy to pan-Slavic solidarity.

The "economists," who had little interest in Communist ideology and little patience with the class hostilities encouraged by Communist leadership, but were loyal because they believed Communism could raise the general living standard.

The "intellectuals," who were willing to serve as propagandists because of the importance it gave them.

Target delineation may, of course, be carried much farther than this. Given adequate intelligence, it would be perfectly possible to delineate the pertinent characteristics of Christians in North Korea, or of a specific union of communications workers, or of the students at a given university. Let us conclude here with one caution: the intended target audience for any given psywar message is rarely coterminous with the actual audience for that message. Psywar channels are rarely so sharp and well defined that they will cut off at the borders of the intended target. A radio signal will not pick out the receivers owned by Christians in North Korea. Leaflets cannot be made to fall only on the homes of trade unionists. A loudspeaker broadcasting to an isolated enemy unit will not be heard only by the commander of that unit; his men will hear it too. Indeed, only in person-to-person communication can one be fairly sure of the limits of his audience, and even then he cannot control the secondary audience. Thus the psywar planner needs to consider the extra audiences listening or looking over the shoulders of his intended audience. Will his message contradict what other messages have told this "extra" audience? Will it expose his intended audience to suspicion or risk? On the other hand, can he so design the message that the extra audience will be a "bonus" audience; that is, can he take advantage of the curiosity of the eavesdroppers to plant some useful facts and ideas?

SECURITY **RESTRICTED** INFORMATION**SELECTING THE CHANNEL**

The layman tends to think of psywar in terms of short-wave radio, or of radio and leaflets. Actually, of course, any channel by which man communicates to man may be a medium for psywar. The number of media available to a psywar planning officer are likely to be limited as much by his ingenuity as by his facilities.

Three Neglected Channels

Three kinds of channels are especially likely to be neglected by the psywar operator who thinks of channels mostly as mass-media channels. One of these is the face-to-face channel. The Communists have developed to a very high point the technique of the mass meeting (for example, peace congresses) with vast preparations, parades of distinguished men and women from many lands, and a dramatic backdrop of publicity. They have also used face-to-face methods extensively in their consolidation operations within their satellite states. By far the most numerous of all psywar employees of the Communist states is the agitator, who works individually as an evangelist for the cause, as an organizer, and as a channel for information both to and from Party headquarters. In a state like North Korea before the current war hardly a person got through a day without going to at least one political meeting, which might have been in his place of business, his trade or professional association, his school, or his neighborhood. The variety of meetings was almost endless. There were lectures, readings, discussions of current events, confessionals, political dramas, and parades. The largest parade in the history of Seoul was one organized by the occupying Communists in September 1950 as a final attempt to boost morale in the face of the Inchon invasion. The parade was supposed to celebrate the fact that the invaders had been thrown back into the sea, although a few days later the US Marines came in over the route of the parade. So far we have been speaking about face-to-face psywar in Communist-controlled territory. When Communist psywar is operating in countries that are still free, there are sharp limits on the number of meetings and parades that can be held, so that more emphasis goes on other face-to-face methods. Their covert agents, for example, over and above collecting information to send back from the place where they are stationed, plant rumors, make contact with dissident elements in the target population, and help plan and support subversion. Whether, or on what scale, the United States is using covert

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

agents abroad in this way, we shall probably not know until many years hence.

Another kind of psywar channel sometimes neglected is the use of events to communicate a message. We have already said that events have symbolic meaning beyond the immediate frame of reference, and it is apparent that military commanders and statesmen alike should think of the implications of their actions before they freeze their plans. But the psywar planner has it within his power to plan and use events with this purpose in mind. For example, no one would maintain that the success of the German blitz required, speaking in physical terms, the large-scale use of divebombers that accompanied it. Rather, they were intended to spread panic and disorganize resistance, and did serve admirably as a psywar weapon.

In South Korea at the time when large portions of it were occupied by the invading Communists, the appearance of an American plane in the sky, even at the low ebb of UN fortunes, was regarded by the South Korean people as a message of hope and encouragement from us, urging them to continue resistance. So, similarly, a bombing raid, an artillery barrage, a shipment of food to a neutral country, or the appointment of a certain person to a position of importance may be used as part of a well-conceived campaign of psywar and may serve to reinforce the part of the campaign that moves through mass-media channels.

A third kind of psywar channel often used during World War II was "gimmicks"—small articles that symbolize or carry with them a psywar message. For example, small bars of soap, tea bags, false ration cards, counterfeit money, and other useful items were dropped over occupied Europe, usually with wrappers carrying a printed message. A less formal version of the same technique was put into effect voluntarily and spontaneously by some of the Berlin airlift pilots, who often dropped small bags of candy where they would be picked up by German children. Gimmicks may either serve as a bait to get people to read or think about a psywar message or be a message themselves. They may arouse an emotional state or a series of memories that even the most skillful words could not be counted on to evoke. The actual effectiveness of gimmick operations is not well known as yet, and in the absence of good research evaluation the psywar planner will do well to pick his gimmicks carefully and think twice about where they are to be used. They are expensive, relatively slow, and are capable of backfiring if poorly adapted to the target, as, say, luxury items of dress would do if dropped on a population whose

SECURITY **RESTRICTED** INFORMATION

food supply was near exhaustion. But they offer a real challenge to the planner's imagination and ingenuity.

The mass media, for psywar purposes, may usefully be broken down into three distinct groupings or categories: We may think of motion pictures, books, magazines, pamphlets, etc., as slow media, of radio and loudspeakers as fast media, and of leaflets, posters and newsheets, and newspapers and news operations as in the middle category, neither slow nor fast. News evidently requires the fastest media available to reach the target; if radio and loud-speaker are not available, newspapers or leaflets are at least more satisfactory for the purpose than books or pamphlets. Sometimes, in other words, the character of the material to be communicated clearly dictates the category the operator must use. However, other considerations than speed enter into his choice. For example, is it possible to get news in a satisfactory form into the newspapers of a target country? If not, is it practicable to drop newspapers or news leaflets on the target population? What kind of defense has the target country against news broadcasts beamed in its direction? What special advantages does this or that medium offer as a carrier for this message? Studies by some investigators suggest, for example, that auditory media more easily arouse emotionally held attitudes, whereas printed media work better in the case of difficult material because the reader can set his own pace and repeat at will. This illustrates the kind of questions the psywar planner must answer in choosing his medium.

The following pages are given over to a few notes on defenses that may be erected against each of the media, the strength and weakness of each as psywar channels, and the chief uses of each in psywar.

Fast Media

Radio. (a) Defenses. The Communist countries have taken most of the actions against psywar radio (this country's and that of its Allies) that can be taken. They have confiscated radios. They have sealed radio receivers to the wave length of a Communist station or restricted radio listening to loudspeakers that can be fed only from a central and controlled source. They have decreed punishment for listening to the enemy (that is, capitalist-imperialist) radio. And they have struck at the enemy signal itself by jamming, that is, by interfering with it so that it becomes unintelligible. Russia is thought to have more than 100 transmitters used for jamming.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

(b) Strengths and Weaknesses. Despite the fact that such defenses can be set up against radio, it remains the quickest and most dependable way to get messages into any target country where there are receivers. It can jump border controls and iron curtains. It does not require mediation between communicator and receiver by any third party (for example, the man who drops leaflets from a plane, the man who tacks up posters, the secondary communicator who reads a leaflet aloud to illiterates). It is the swiftest of all media. Because of its speed, and because of the entertainment it furnishes at low cost, it is vastly popular with a wide variety of audiences, and psywar by radio can thus hope for access to many kinds of homes. As a matter of fact, one of radio's great strengths as a psywar medium is that it combines wide coverage and great speed. On the other hand, and for the same reason, it is not always an effective medium for reaching a select audience. It does not let the listener set his own pace, or stop to reread difficult material, or stop to think; it does not, therefore, lend itself to difficult or technical material, material that calls for reflection on the part of the recipient, or even material that depends upon accurate reception of names or statistics. The human voice, to be sure, gives a personal quality to the messages broadcast and lends itself to persuasion. Even so, a good part of radio listening is undoubtedly done at a relatively low level of attention. That is why American commercials use the formula of shock and repetition as they do.

(c) Uses. Radio has seldom been used in tactical psywar because the target audiences do not, except, for example, in the siege of a fortress city, have receivers. Along with leaflets, however, it has been the chief channel for strategic psywar. It has been used to good effect in consolidation operations and, as the development of the VOA illustrates, it is one of the main channels for political psywar. In actual psywar practice it is for the most part a news and news commentary medium. In the Far East theater, more than half of psywar radio time has been devoted to news, the usual formula being just enough entertainment to bait the hook, a relatively small amount of persuasive material, and the remainder news and other information important to the target audience. Psywar radio is therefore mostly "talk" radio. The more rigorous the controls on radio listening in the target country, the more the broadcasts must be in short segments, often repeated, so that listeners who are able to use the radio for only a short time will still be able to get the essential message.

SECURITY **RESTRICTED** INFORMATION

Loudspeakers. (a) Defenses. Defenses against loudspeakers are counternoise or attack at the source, that is, shooting down the airplane, blasting the tank, or otherwise putting the loudspeaker's carrier out of action.

(b) Strengths and Weaknesses. One strength of loudspeaker operations is obviously that defense against them is difficult. They have, moreover, the advantage of speed and immediacy, and that of being able to select a specific target and talk to it, which cannot be done by radio. But this strength is, from another point of view, a weakness. The coverage of loudspeakers is usually restricted to a radius of somewhere between a half mile and a mile. Where speakers are used in tactical psywar, moreover, the teams operating them must cope with all the dangers, inconveniences, and distractions that naturally arise in a combat zone, and the messages, besides being directed at men who have their hands full, can often hardly be heard over the noise of the battlefield. Loudspeakers, like radio, have the advantages that attach to communication via the human voice but even less than radio can count on accuracy of reception.

(c) Uses. Loudspeakers are chiefly useful in tactical situations where the target is specified and what is required is a timely message tailored to its peculiarities. An example of this would be psywar addressed to an isolated enemy unit in the hope of persuading it to surrender without further casualties. Another example would be directions broadcast to civilians from a "talking plane" in the hope of keeping them out of the way of advancing troops. In consolidation operations speakers are usually mounted on trucks and have proved extremely useful. Loudspeaker messages must be brief, simple, and often repeated. The greater the distractions against which they must compete, the more important this quality of the message.

Medium-speed Media

Leaflets. (a) Defenses. The chief defense against leaflets dropped from an airplane or delivered by artillery is to establish a penalty for picking them up and/or reading them. The defender may also attack the point of dissemination, that is, the airplane or the battery.

(b) Strengths and Weaknesses. Leaflets are usually small, the size of a page in the average book, or even smaller. This makes them relatively easy to conceal, and at the same time enables distribution in great quantities (in Korea, upward of 100

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

million per month). The small size, of course, restricts the amount of copy and supplementary maps, pictures, and diagrams they can carry. Leaflets, unlike radio and speaker broadcasts, can be retained and reread, studied, passed about, etc. For example, a large number of Communist troops who surrendered in Korea were carrying surrender-pass leaflets. Since, however, leaflets must be designed, printed, packaged, and delivered, they are much slower than radio and consequently not an effective medium for news except in situations where the recipients have no alternative source. In combat psywar, for example, leaflets with brief news summaries are fairly common. In general, leaflets are less useful against targets in which there is a high incidence of illiteracy, unless the message can be embodied in readily intelligible graphics.

(c) Uses. Leaflets are used mainly in tactical and strategic operations. They lend themselves much better than radio to tactical psywar because receivers are seldom available to combat troops, and in strategic psywar they offer the easiest means of communicating messages to regions where radios are scarce. They are restricted, however, to places where US airplanes can fly or US artillery can fire and therefore are normally unusable in political psywar. They are little used (except as handouts) in consolidation. Psywar operators in the past have employed them primarily for persuasive messages aimed at submission, subversion, privatization, or panic and capable of being expressed in a few words plus a drawing, photograph, or map.

Newspapers and Other News Operations. (a) Defenses. Censorship and control are the commonest defenses against enemy news. For example, the Communist countries have their own wire news service, Tass, which feeds their newspapers and is itself under constant surveillance by their censoring apparatus. The defense against newspapers or news sheets dropped on enemy territory is the same as that against leaflets, that is, punishment for picking them up and or reading them.

(b) Strengths and Weaknesses. Newspapers are slower than radio but have, so to speak, higher specific gravity. If the psywar operator can get his news into the customary news channels of the target country, so that it appears there without notable distortion, his messages can often get through free of some of the stigma that attaches to propaganda. In many countries, moreover, printed news has a certain prestige that radio news still lacks. Printed news can be effectively combined with illustrations and with entertainment (for example, cartoons), and can

SECURITY **RESTRICTED** INFORMATION

be read at the reader's own pace, reread if necessary, and filed away.

(c) Uses. Use and control of the news media is of course one of the basic procedures of consolidation psywar. The political psywar operator tries especially to get his news into the wire services and papers of target countries. This is next to impossible if America is at war with the target country, but in this case newspapers are sometimes printed in the target language and dropped from airplanes or otherwise smuggled in. Such publications are, of course, harder to deliver than news leaflets or radio news, although it was felt in World War II that German-language newspapers distributed by the Allies were quite effective. One variety of this technique is to print "black" newspapers, deliberately tear them up, and leave fragments around where the target population is likely to see and read them. A surprising amount of communication is sometimes accomplished by this method.

Posters and Newsheets. (a) Defenses. The defense against posters and newsheets is to police the bulletin boards and walls on which they can be posted. The rules and understandings of international relations for the most part discourage psywar use of this medium except in Allied countries, where the operators can count on cooperation from the authorities. In territory being consolidated, the chief defense against the consolidating power's posters is to deface them.

(b) Strengths and Weaknesses. Posters have the advantage of providing an ample space for display. They can carry illustrations and often present themselves very dramatically to the viewers. On the other hand they get rather brief reading and usually therefore must carry quite brief copy.

Even the newsheet type of poster must ordinarily be in large type, so as to be read by a number of people at the same time, and its news content is therefore scanty. On the other hand each poster can cover, as compared to a leaflet, a very large number of readers. Often, moreover, there is an advantage in encouraging the kind of discussion and group feeling that occurs among a cluster of persons reading the same poster.

(c) Uses. Posters are restricted mostly to consolidation operations and political operations in very friendly countries. The Russian Communists especially have used them with great effectiveness in their own and satellite territory. One of their favorite techniques is to present a great bank of identical posters, so that the passer-by is presented a dramatic invitation to read.

SECURITY **RESTRICTED** INFORMATIONSlow Media

Books, Magazines, Pamphlets. (a) Defenses. These media, for the most part, must pass through border controls and through commercial distribution systems. Thus a target country defends itself against them by controlling what passes the border and by owning or controlling the means of distribution. For example, no American books get into the Soviet Union except those that the Russians feel will not damage their own cause—for the most part, technical books and left-wing fiction. American magazines that reach the Soviet Union are similarly restricted.

(b) Strengths and Weaknesses. The slower media can, of course, treat their subject matter more fully than other types of printed matter. Their appeal is often to the intellectuals and idea men of a target. Their influence, therefore, is normally exerted over the long term; for example, Marx, Lenin, and the Communist Manifesto have operated as psywar in slow printed form for many years and continue to be effective. On the other hand it is easy to control the distribution of these media, and their use is restricted in any case by the literacy and educational level of the target population, as also by the fact that they cannot be absorbed in brief intervals as, for example, can radio and leaflets. One of their great advantages, especially evident in the case of magazines, is that color and illustration may be used, and fast color printing has recently made possible a new and highly promising printed medium, namely, cartoon books, which both the major contestants in the cold war have printed and distributed on a large scale. This gives psywar at least one slow printed medium that can be made to appeal to the lower educational groups and to the young, rather than to the educated and grownups alone. Not the least of its advantages is that it can be mass-produced and therefore costs relatively little.

(c) Uses. The slower printed media are used chiefly in political and consolidation operations. There is, however, a certain input of books into countries at war, and there have been several cases of clandestine distribution of cartoon books during 1950-1952.

Motion Pictures. (a) Defenses. Any target country can control the exhibition of motion pictures within its frontiers merely by restricting entry and requiring permits for the use of projectors. When the Communists took over North Korea, for example, they eliminated the showing of all motion pictures that originated in capitalist countries. In certain other controlled areas they

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

have kept out all American films except those they regarded as reflecting badly on American civilization.

(b) Strengths and Weaknesses. Motion pictures have the advantage of great popularity with their audiences. They can reproduce an event or scene with lifelike fidelity, explaining a process or action via the simultaneous use of words, pictures, and movement. They are ordinarily shown to groups, and therefore have the power to arouse crowd reactions and stimulate discussion. On the other hand, as noted above, they are exceedingly easy to control and therefore lend themselves almost exclusively to friendly psywar operations.

(c) Uses. Motion pictures as psywar tools are limited almost entirely to political and consolidation operations. There is very little likelihood that one of our pictures could penetrate the Iron Curtain, for example, unless the Communists believed that its exhibition would be to their advantage.

Media Questions

The planner typically asks a certain group of questions in selecting the media for his campaign. Among these are:

Which media are prominent in the target audience's focus of attention? The basic question is, Where do the people in the target audience go for their information and guidance on the subject matter with which the psywar message is to deal? In the absence of a full knowledge about this, the psywar planner can make useful deductions from statistics on literacy, newspaper circulation and distribution of radio receivers, reading and listening patterns, and, if the target covers up all these facts, the way its own propagandists use communication media for their own purposes.

To which of these media does the United States have access? Pravda is an excellent channel to the Russian people, but Americans haven't much chance of using it. It would doubtless be effective to drop leaflets on such and such a Russian province, but to send American airplanes over the Soviet Union would, within the present pattern of international practices, be regarded as a belligerent act. There may be relatively few short-wave radios in that same Russian province, but there are some, and Americans do have access to radio.

Which of the possible media are most suitable to the purpose and the message? A cartoon book would not likely be suitable for a dignified message signed by the Supreme Commander. A leaflet would furnish too little space for a refutation of Marxist doc-

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

trine; if the latter is the purpose in hand, what is indicated is a book. Explanation of a complicated process will probably require print, not radio. An announcement for which time is of the essence will usually require radio or loudspeaker.

Which media can be used with least danger to friends within the target country? Friends inside the country are as anxious to receive the psywar operator's communications as he is to send them. How can he minimize the risk they run in receiving his messages? Can he, for example, by dropping leaflets at night, make it easy for friends to pick them up unobserved? Can he make radio safer for them to listen to by repeating short segments of program again and again? In what situations should he use covert agents to make contacts with friends?

How can the United States use media so as to reach the largest percentage of the target? Coverage is only one consideration here, since secondary communication is, if anything, more important. In any tactical or strategic psywar except loudspeaker operations, the psywar operator is likely to reach only a tiny fraction of the target. Thus the question arises, how can America get its listeners or readers to pass the message on to others? It is known, for example, that the few anti-Communists who were able to retain radios in occupied Seoul formed little circles of known friends who acted as chains for relaying the news from Allied broadcasts around the city. In every society there are patterns by which such information circulates. The problem is to learn about and then stimulate those circulatory patterns—organizations, informal groupings, republication, rumor, gossip, etc.—and thus multiply the audience.

This brings us again to mention organizations, which are certainly one of the powerful media of psywar, although many people are not in the habit of thinking of them as such at all. It is the Russians, above all, who have shown Americans the importance of organizations in changing attitudes and affecting the exercise of power. Indeed, you can hardly think of a Russian campaign in which organizations have not played a significant part: the study groups in which intellectual converts are sought; the Party, which rewards and reinforces the converts; the unions, educational organizations, and social improvement groups into which Party members try to infiltrate in target countries; the political fronts, through which the Party works in trying to take over power; the mass organizations that regiment the life and thought of a people when the Communists have taken over. Organizations are useful psywar media to the Russians, and can

ORO-T-214

255

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

be to Americans, because (a) they will discuss and pass around any information planted in them, even by a single one of their members, (b) they can enforce conformity on their members, (c) they can reinforce the hesitant attitudes of their members, and (d) once convinced and won over, they have the power and numbers to act. In fact, it has been said that a map of the organizations of a target country is more important for propaganda purposes than any other single map intelligence can possibly obtain for psywar operators. Be that as it may, when the psywar operator chooses his media, he should always ask, how can I plant this message in the organizations that can do something about it?

DEVISING THE MESSAGE

The most important moment in psywar is the moment when the message is turned loose to seek its target. We have already spoken of that peculiar but characteristic quality of communication that divorces a message from the communicator the moment he has spoken the words or written them on paper. Thereafter he can do no more about the message because everything that happens will have to happen between the message and its recipients. Thus all psywar decisions—the specifying of purpose, selection of target, choice of channel, timing and relation of one transmission to others, and, of course, the devising of the message itself—lead up to the crucial second at which the message is turned loose.

Let us recall now what it is we expect of that message when we let it go. A message is expected to (a) attract the attention of the target we have specified, (b) get its meaning across to that target in about the way we understand its meaning, and (c) start a response in that target in the direction we want it to move in.

A message designed to accomplish these things may be words, spoken or printed. It may be pictorial—a drawing, a photograph, a chart, or lights and shadows on a screen. It may be an event. It may be nonverbal sound, such as the Chinese bugle calls early in the Korean war or the roars of the wild animals—that some ancient people used to take along to battle—a primitive but sometimes highly effective kind of psywar. It may be any combination of these. But whatever it is—whether a leaflet, a shout, a broadcast, a book, a motion picture, a plane overhead, an army maneuvering on the border, or a bugle call—

SECURITY **RESTRICTED** INFORMATION

it must still be so devised as to go out by itself and accomplish the three tasks we have named.

For example, here is a Communist leaflet dropped on American troops in Korea. It offers you a chance to look at a psywar message through the eyes of its target rather than its source. How effective do you think this leaflet would have been? How could it have been made more effective? Is there anything in the copy that does not sound like common American idiom? If so, does that detract from the potential effectiveness?

DO YOU NOT MISS YOUR PARENTS, WIVES AND CHILDREN AT HOME?

Surely you have aged mothers at home who spend their days and nights weeping and sighing for you, and dear wives who fondle the youngsters crying for their absent fathers!

To those dear ones awaiting your letters and your homecoming, a news informing of your dog's death must prove not only a shock but also an arrow of keen pang.

What an unworthy death it is that you should be sacrificed in a battlefield that has no personal interest whatsoever for you and in a war that has been staged by the Wall Street warmongers!

For what infernal cause are you wandering in this valley of death, when you have your flowering youth shining before you in all the ray of hope?

Cast aside all anxieties! Do not hesitate to surrender to the People's Army!

You will then be able to meet again your comrades who have come before you, and soon return to your sweet home.

Wave this handbill high in the air and come over to us! That is the only way of saving your precious lives and of enabling you to return to your families.

The Korean People's Army never shoot at those who surrender. Come over to us in full confidence!

Symbols

And let us remind ourselves of one other feature of a message. Whatever it accomplishes, it must do by means of symbols. We have said in Chap. 2 something about the symbolic nature of psywar, but let us expand this statement a bit here and apply it more directly to the preparation of a message. The making of a message really involves a series of steps in using shorthand. The pictures in our minds are shorthand for the world of reality around us. For example, we have in our minds the symbol "mountain," which is shorthand for all the mountains we have ever seen or heard about. This symbol is very useful to us because it makes the world of experience and imagination both maneuverable and systematic. To make this world of experience transferable between individuals we develop the word mountain, which stands

SECURITY **RESTRICTED** INFORMATION

for the picture of mountain we have in our heads. As we call the picture a "symbol," so we can call the word (which is another level of symbol) a "sign," and we recognize that it is shorthand one degree farther removed from reality. When we print the word "mountain" or speak it, we can call the sound waves or the ink marks a "sign-vehicle." We are then using shorthand three degrees removed from reality. And this is what a psywar message consists of. By themselves they mean nothing, these ink spots or sound waves. To a person who does not know English or to a person who has never seen or heard of a mountain, the ink spots or sound waves that make "mountain" will be meaningless. But we hope that the person who sees or hears our word "mountain" will have that word in his language and that it will stand for a picture in his mind not unlike the picture of a mountain in our minds. The question is, will it? On that, much of the success or failure of the message will depend.

Different individuals, different cultures, tend to use different shorthand systems. For a man who has lived all his life in New Hampshire the sign-vehicle "mountain" may call up a different picture than it calls up for a man who has lived all his life in the Colorado Rockies. In the case of different countries, and especially in the case of abstract words, the differences may be dramatic and striking. This poses great problems to the psywar operation.

An airplane flying over Korea at the present time symbolizes UN control of the air in the Korean war. This symbol is close to reality as ordinary Koreans experience it day in and day out, so that there is little chance of its being misinterpreted. Mountain is a symbol that is relatively close to reality for persons who have lived among mountains, or studied geography, or traveled. But take such a word as "democracy," which is as much a part of America's psywar as the airplanes this country flies over Korea. Whereas most Koreans grasp the meaning of the airplane, and the very meaning intended, do they get the American meaning of democracy when we speak of it to them? Does "democracy" symbolize to them the same system of values and pattern of behavior it symbolizes for Americans? American spokesmen in Korea very soon found that it does not.

The higher the level of abstraction, the greater the danger of the shorthand being misinterpreted. The farther apart the cultures, the greater the likelihood that the shorthand systems will not be the same.

We have been describing this relation in terms of cultures. We could also describe it in terms of personalities. Our target

SECURITY **RESTRICTED** INFORMATION

will consist of persons, moving within a framework of social heredity that we call a "culture." These persons will, however, have had different experiences and will have established different patterns of needs, values, and attitudes. The relation between psywar source and psywar target, hanging as it does on a tiny thread of symbols, is therefore even more tenuous than we have described it; even within the same culture different persons may interpret a given psywar symbol differently.

Now what does this tenuous relation mean to the psywar man who has to devise a message? It does not mean that he should address all his targets in baby talk. It does mean that the unit that builds the message should have within it the highest possible concentration of knowledge of the target culture and language that its country can supply. So much is axiomatic. But it means even more than that. It points to the one indispensable quality of good psywar.

Empathy

We call this quality "empathy," that is, the ability to arrive at a sympathetic understanding of other human beings. You can see this quality in some of your friends. They are understanding, whereas some others of your friends are not; they seem to know how you feel and how and when to talk to you, in a way that your other friends somehow do not. You yourself probably have great empathy for some persons and less or none at all for others, and greater empathy for any particular person at some time than at others. There are times, that is, when you feel that you can put yourself in that person's place and understand how he is feeling and why he is reacting as he is, and other times when you find him quite incomprehensible.

This is one quality above all others that the successful propagandist must have. It is learned rather than inherited at birth, and to some extent it may be learned consciously, through conscious effort at trying to think oneself into the position of someone else. The student of psywar can, for example, set himself the task of writing a propaganda leaflet as his target audience might write it, and confidently expect to grow and develop as a propagandist by repeating the experiment again and again. As has been suggested in Chap. 2, the American psywar student, for example, might make himself write the kind of paper a convinced Russian Communist might write on "Why I love Stalin," or "Why our system is better," or "Why I like the collective farm"—any-

ORO-T-214

259

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

thing, in other words, that would require him to imagine himself as knowing only what his target individuals know, feeling and thinking only the way they feel and think, about some of these key subjects.

The quality of empathy is so basic that it may be said to underlie everything we can say about how to write a message. Writing a message is not a matter of rigid rules, such as that psywar writing should be conversational, or that psywar writing should never be above ninth-grade difficulty, or that psywar writing should follow the rules of good advertising. The goal of psywar is to motivate a certain behavior; the test of psywar writing is therefore whether it will in fact do so. We are working here, in other words, with a practical, not an aesthetic, question. We know we have to gain the attention of our target, and in Chap. 3 we learned certain general ways of attracting attention. We know we have to get our meaning across, and we have learned some of the things we need to know about patterns of perception. We know what response we want to motivate and something about how that is done. But the specifics of the process—the application of this knowledge to a specific task and a specific target—require from the psywar operator the greatest possible empathy with the target he is trying to reach. The better he can think himself into the target individual's shoes, the better he will know what will attract attention, how to say it so that the meaning will be clear, and what devices and appeals will get the response he wants.

This is not intended to suggest that empathy is anything mysterious and mystical or that it can substitute for knowledge. It is not and cannot. Before the psywar operator decides on what level of difficulty he is to write, he must, for example, know something about the educational level of his target. He must know what the target is used to reading or listening to. Perhaps a conversational style will seem unduly familiar or a ninth-grade reading level too condescending. Whom would the target be likely to believe? The psywar operator, we are saying, has to know these things before he quotes authorities or attributes the message. Similarly he has to know whether the target has any particular color symbolisms or other symbol patterns that limit what can be said to its individual members. In short the communicator must know the culture and, preferably, also the language very well. The psywar process has one cylinder missing unless this kind of knowledge enters deeply into the preparation of the message.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATIONElements of an Effective Message

What happens in a message? We usually say that the writer of a psywar message is manipulating the symbols of propaganda. But what exactly does this mean in terms of what goes on in a message?

It means, in the first place, that the writer must arrange his symbols in a way he thinks will attract the target's attention to them. There is a simple rule for that which you can add to what was said in Chap. 3 about novelty, contrast, and figure-ground relation, namely, invite attention, early in the auditory message or at a conspicuous place in the visual message, to a personality need.

This is what the advertisers are doing when they lure you to an ad by indexing it with a picture of a bathing beauty. This is what the radio commentator is doing when he introduces an item with "Flash!" or "Bulletin!" That is what the poster does in virtue of its pungent headline. In other words, these devices really index a message for us by classifying it under the needs it might meet for us. Thus the wise psywar operator will put in a headline or picture or cue phrase to stimulate interest by pointing out a need to which the message relates, and will thereby attract attention to it.

In the second place the writer of a message will use his symbols in a way that, he has reason to believe, will lead the recipient to accept its contents. Here we may suggest two additional rules:

Try to establish an atmosphere of authenticity and authority.

The psywar operator uses prestige spokesmen. He names names and cites figures. He tries whenever he can to include some item by which the audience can easily check his veracity. He uses pictures that will be recognized (the Communists, for example, have made good use of pictures of their American POWs). Above all, he tries to find out what sources and evidence the target's mind regards as credible.

Try to establish an atmosphere of consistency.

This means simply that the writer tries to avoid real or seeming contradictions. He tries to be sure that neither little slips in words nor big slips in policy or reporting shall creep into what he writes. He does this usually by establishing central policy lines that he must follow and constantly checking content against them.

ORO-T-214

261

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

The tone of the usual psywar message is friendly. The writer tries to draw his listeners with him into an in-group (on some basis) as opposed to some out-group. The Communists talk to our soldiers as one fighting man to another—"none of us want to fight this war; you are being 'used' by Wall Street and your politicians; don't stand for it; join us for peace." Commander Norden talked to the German sailors as one navy man to another. Sometimes it is necessary to adopt other tones, but generally acceptance is sought via a friendly approach and a relatively informal style.

In the third place, and most important, the writer will so manipulate symbols as to—let us recall Chap. 3—(a) arouse personality needs of the target individual and contribute ways of meeting those needs that will be favorable to the operator's side, and do this when the person is in a group situation where the appropriate actions have some possibility of occurring, and (b) make the actions urged or implied in the message seem important from the standpoint of the target's important current background grouping, and do this while the action seems appropriate to personality needs.

This is the heart of a message because it is here that the writer must call on all his knowledge of and empathy for the target and work out a paradigm that will lead to the kind of attitude change and action he wants.

Suppose, for example, that the target is a North Korean Catholic who has obvious frustrations because he is not allowed to practice his religion, and yet is caught up in a Communist union and a series of Communist groups that are pouring their dogma into him. This man will have urgent personality needs that we need not try to describe here, and he will need above all to resolve the conflict between his religion and the political philosophy and practice of his state. We can guess that his religious attitudes will be emotionally involved and that his memory of his church will be warm and nostalgic, but we can guess also that it will be practically impossible for him to take overt action against the Communist government without running the risk of severe punishment, even loss of life. The psywar operator can guess also that a number of symbols of the church will be for this man highly charged with emotion.

Now the question before the psywar operator, chewing his pencil in Seoul or Tokyo, is, How can he devise a message that will begin with these personality needs and suggest some desirable ways of meeting them, some things that will help America and that

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

the man can nevertheless do without being shot by the security police or landing in the People's Jail, thereby eliminating himself as one of America's friends behind the Curtain? It is an intensely practical problem and a grim one since it involves life and death. The writing of a psywar leaflet or script is not merely "expressing oneself" or "selling Americanism."

The message writer might decide that for the time being his goal should be merely to keep up the hope of such a target individual, so that he will not entirely give up Christianity and, without doing anything about it for the moment, remain psychologically prepared for future messages from us. Or the writer might decide that he should encourage the target individual to get together with other Catholics, hold secret church meetings, and form together a little island of anti-Communism. Or he might give the target individual a means of resolving his conflict by passive resistance to Communism, or sabotage, or malingering. Whatever he decides on as a goal, his task in the message will be (a) to identify and stimulate certain personality needs in his target and (b) to suggest some means of satisfying those needs that will be desirable from our point of view and yet within the limits set by that individual's social relations and personal values. That, essentially, is what happens in a message.

But there are certain additional proved rules of propaganda that the writer may very well wish to follow. For example:

Manipulate the words of propaganda in a fashion that will make people remember them.

He will use hard-hitting easily remembered slogans ("Make the world safe for democracy") and labels ("Huns"). He will manipulate stigma. That is, he will try to build up the enemy and his leaders (recall our pictures of the Japanese and of Hitler in World War II) into symbols of hate and rejection. He will not hesitate to write in terms of the two-valued orientation that the followers of Korzybski so much deplore; that is, he will describe the choices before his target audience as bad (the enemy program) and good (America's program), black and white rather than shades of gray.

When possible, try to provide targets for aggression. He knows there will be some frustration in the target audience, and indeed he may try to build more (for example, by tantalizing enemy troops with reminders of the pleasures and comforts they are missing). His problem will then be to displace the resultant aggression against targets within the enemy structure, rather than against the opposite side. For example, he may try to

SECURITY **RESTRICTED** INFORMATION

turn the aggression against enemy officers for having led the troops into such a situation, or against more favored groups within the army or the civilian group, or against the government for not having spared the target this frustration, or against special minority groups.

When possible, try to provide targets for identification, emulation, and love. He will try to get his target audience to identify themselves with well-known persons who have done something like what it is desired that the target audience should do, such as surrendering or becoming defectors or opposing the government in power or having in previous eras been friendly with the propagandist's government. He will try to encourage the target to emulate these persons, admire them, and even love them.

Try to arouse emotion where it will be to your benefit. The writer will seek to appeal to emotionally and ego-involved attitudes, to use rich symbols, and to stimulate the kind of emotionality under which propaganda seems to work the fastest change.

Repeat—with variations. For this the writer has the time-tested example of the advertiser, and the precept of every propagandist who has discussed the subject. "Don't contradict," says one of them. "Just assert and assert and assert." "The measure of a propagandist or a politician," says another, "is how many ways he can say the same thing."

Let us hasten to say that there are many kinds of psywar messages. Some straight news, for example, will have less need for some of these devices than will, let us say, a persuasive leaflet or an appeal to an enemy unit by radio. Whatever the kind of message, however, ultimately it has the same kind of purpose and the same need to be attended to, understood, accepted, and acted on.

Hitler's Rules. Comparison of the suggestions we have made in this book with Hitler's propaganda rules should be of great value. The rules may be summarized as follows:

1. The proper objective of propaganda is to indoctrinate, that is, to inculcate convictions.
2. Political propaganda must be addressed to the broad masses of the people.
3. Propaganda, in order to move people to action, must be supported by organization.
4. The opponent's attention must be engaged before he can be convinced.
5. The level of propaganda must be adjusted to the mental capacity of the most limited among the intended recipients.
6. Propaganda must concentrate on a few crucial points and repeat them endlessly.
7. Propaganda creates convictions by emotional appeals.

SECURITY **RESTRICTED** INFORMATION

8. Propaganda must be cast in terms of simplified affirmation and negation.
9. Propaganda must have a flavor of aggressive strength.
10. Propaganda must not conflict with the actual needs and experiences of the recipients.
11. Propaganda must not be confined to words but must include corresponding action.
12. Propaganda must play on the powerful motives of hope, rooted aspirations, and fear of destruction.
13. The effectiveness of propaganda does not flow from the truth of its content.⁵

There is another respect in which all messages are alike. In one proportion or other, every message is a combination of entertainment, information, and persuasion. We speak here of entertainment in its widest sense, to include shock, surprise, and the aesthetic pleasure to be derived from appearance and sound over and above the entertainment come-on familiar to, for example, the American radio listener. Entertainment's function in psywar is usually to bait the hook and attract attention and interest for the message itself, as Tokyo Rose, for example, played popular tunes as a bribe to get Americans to listen to her propaganda. Entertainment may, however, also be used indirectly for persuasion. Tokyo Rose's music was calculated to make American soldiers homesick and warsick. And when the Communists broadcast music on their radio they try to make sure that if their listeners relax it is to a Red Army song, or an ode to Stalin, or a symphony by a solid Soviet composer; "purposeful relaxation" they call it. Likewise information may be used indirectly for persuasion—news, for example. And sometimes persuasion becomes merely instructions: how to do something the listener is assumed to have decided upon already. But this is the general pattern of all psywar messages: an eye-catching leaflet informs you that certain of your buddies have been captured and are receiving good treatment, and tries to persuade you that you too will be well treated if you join them; an impressive bomber in the sky over Korea in the summer of 1950 informs South Korean watchers that the United Nations is still in the war and still powerful, and tries to persuade them that if they stay loyal and hold out they will be rewarded.

Here are some questions that commonly come up in or just before the stage of devising the message:

Black or White?

The psywar with which the readers of this volume will be concerned for the most part will be "white," that is, overt

SECURITY **RESTRICTED** INFORMATION

propaganda. The choice as to when to use white and when to use black is nevertheless one of the fundamental decisions in the planning of psywar, and we pause now to consider some of the advantages and disadvantages of each form.

The strength and the weakness of white propaganda both derive from its essential characteristic, that is, the fact that its origin is openly avowed and that it acts as the official voice of the sender.

In some cases this is a notable advantage. In the psywar campaign built around Wilson's Fourteen Points, every effort was made to drive home the official nature of the messages. The Points, as you will remember, were a blueprint for a postwar world that offered the hope of peace and a better life to all Europe, to the vanquished nations as well as the victors. The psywar, in other words, was designed to exploit the full prestige and authority of the Allies. Wilson's own voice was recorded and used, as were the statements of other Allied leaders. The Points were released officially to news services and printed in official-looking leaflets. The intention, of course, was to assure the people of Central Powers that this attractive plan really represented Allied policy, and thus weaken their will to resist.

Likewise, surrender leaflets are so designed as to take full advantage of their whiteness. The Allied European surrender pass in World War II carried the flags of the Allies and the signature of their commander. The Korean surrender pass bears the symbol of the United Nations and the signature of the UN Supreme Commander. The purpose, of course, is to persuade the enemy soldier that the pass is a sure-enough official document, which will help him safely through the dangerous and distasteful process of surrender.

White propaganda also stresses its official character when it strikes back at the psywar output of the opposition. At the time of the landings at Anzio in World War II, the Allies attempted to arouse insecurity among certain German troops with a leaflet pointing out that the Allied armies were now in their rear. The leaflet, however, used at a crucial point the word "kesselschlacht," which means not landing in the rear but encirclement, another idea altogether (a reminder of the need for having leaflets written by experts in the language!). The German command at once seized on the mistake by printing a highly official-looking leaflet that carried a reproduction of the Allied leaflet and described the true position. This white counterpropaganda action did much to destroy the credibility of Allied propaganda in Italy.

SECURITY **RESTRICTED** INFORMATION

The limitation of white propaganda is, as intimated above, just what we would expect from its being avowedly the voice of the sender nation. The target audience regards it ipso facto as "propaganda" in the less pleasant sense of the word, and accordingly resists it. It is, in other words, distrusted for being what it proclaims itself to be, and the target government naturally tries to build up this distrust (as the preceding example from Anzio shows). It can be swamped by the magnitude of the propaganda resources available to the target government. Its radio signals can be jammed; it can be counteracted by laws forbidding the picking up of its leaflets and, in peacetime, by curbs on the importation of its printed material, on its information centers, and on its exchange of persons program; it can find itself up against blank-wall censorship. In short, white propaganda must always fight on its opponent's grounds and on its opponent's terms, and with the added disadvantage of having to conduct the fight from a distance.

We must bear in mind also that white propaganda, because of its official nature, is unable to employ many of the devices open to black propaganda. No government would be likely, for example, to place its imprimatur on some of the pornographic leaflets used in World War II, if for no other reason than because exception would be taken to them by its own supporters. (Also, of course, they would prove embarrassing if reproduced or even described in the press of neutral countries.)

Black propaganda, on the other hand, poses for the operator numerous thorny problems of its own. It must channel large amounts of energy into merely concealing its source. It is easy for an operation to start out black but extremely difficult for it to stay black. One slip, one piece of information that can be traced, one printed phrase that does not ring true, and black propaganda turns white as a sheet. Furthermore, its operators, in order to maintain secrecy, must cut communications with planners to a minimum; thus it is hard to coordinate with white but is useless or even self-defeating if it is not coordinated. Effective black operations require highly skilled and trained personnel, able to work effectively while under constant danger of being located and attacked by agents of the enemy.

On the other hand, black propaganda has the great advantage, if successful, that it sluices its material directly into the communication stream of the enemy. Gossip, rumors, planted jokes (which, incidentally, do not have the instability of rumors while being circulated), and planted slogans and visual symbols can all be started on their course by covert operators within the heart

ORO-T-214

267

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

of the enemy country. Occasionally, black leaflets can be used (as in the examples of black propaganda quoted in Part I of this book), and there have been excellent examples of black radio (Operation Annie and Gustav Siegfried Eins). Both leaflets and radio, of course, have to be sent from a distance, as does white propaganda, but often have a better chance of acceptance—at least until their origin is discovered. Becker,⁶ in his review of black propaganda in Europe, says that one of the most effective black printed operations consisted of printing black newspapers and then tearing them up and scattering them. This was done at relatively little risk for the distributor, and, Becker says, a surprising amount of the material thus disseminated got itself read.

In most black propaganda, no holds are barred. Pornography, scandal, rumor, gossip—all the devices of informal attack can be used. Black is also somewhat more difficult than white to strike back at with counterpropaganda. As a matter of fact, the enemy is constantly torn between the wish to answer and the fear that by answering he may spread the offending propaganda. Furthermore, black propaganda can spread the impression that dissatisfaction exists in the heart of the enemy's homeland and thus encourages dissidence and insecurity. This kind of attack is extremely difficult for the enemy (most black is what we have called throughout this book "hostile" psywar) to handle.

In general, black is a less formal kind of psywar than white. It can operate on a large scale with less red tape, less organization, and less equipment. Indeed, a rumor can be spread widely by a single agent in the enemy country. In World War II, Goebbels's own slogans were turned against him. "For this we have the Führer to thank" was scrawled, with damaging effect, on many a bombed German building between dusk and dawn. Such operations require no elaborate organization or equipment, and would, indeed, be less likely to succeed if they had them. Black radio, though it naturally requires a certain amount of formal organization, is more likely to be effective if it sounds informal. Gustav Siegfried Eins was supposed to be a station operated clandestinely by a dissatisfied German officer who represented the professional German military man's opposition to the Party. Gustav's voice was rasping, his humor was pornographic, his broadcasting technique was amateurish, and he pretended to move his transmitter around one jump ahead of the Gestapo. But he sounded real. And this is perhaps the greatest strength of black operations that depend on informality.

SECURITY **RESTRICTED** INFORMATION

One other generalization is perhaps in point here. It seems fairly certain, on the basis of experience up to this time, that black operations are more effective in strategic than in tactical psywar, because the communication channels that black requires tend to be unavailable in combat situations. It may also be true that black propaganda is more useful in political psywar conflict than in consolidation psywar. Convincing evidence on this point, however, is not yet available.

True or False?

A vast amount of unnecessary heat has been generated over the question of whether this country should always tell the truth in its psywar output. The question has been given emotional overtones by the argument that a democracy, founded as this form of government is on eighteenth century rationalism and dedicated to the discovery of truth by the self-righting process of public discussion, does not dare to stand before the world as a proponent of falsehood. And the "strategy of truth" in World War II is cited as an example of successful practice along this line.

Yet deception is an instrument that no nation can wholly dispense with if it wishes to affect attitudes and behavior in the outside world. It has, for example, been practiced by this country in every war it has fought. Furthermore the "strategy of truth" in World War II was paralleled by an extensive black propaganda operation, conducted by the Office of Strategic Services, dedicated to the strategy of victory rather than the strategy of truth.

Every country, to be sure, dictatorships as well as democracies, tries to keep its white propaganda as credible as possible. Goebbels insisted that the Nazis always told the truth in their propaganda, and even the Russians—in whose hands the Big Lie has become an omnipresent psywar weapon—pose virtuously as truth tellers.

No country, however, is above occasionally using its white propaganda media for deception when it can thus achieve a success that will not imperil other operations. It is simply a question of balancing the ledger. If white propaganda can be used for deception in a tactical situation and an important success won without impairing the credibility of subsequent output, then it had better be used. The success that can be gained must be balanced, in other words, against the dangers that must be skirted. Certainly no quality of white propaganda is so valuable as its reputation for credibility. If a given use of white propaganda will damage this

SECURITY **RESTRICTED** INFORMATION

reputation in the future, then the deceptive use of white propaganda must promise great gains in order to be worth attempting. That is why white propaganda, as a general proposition, is and must be kept reliable and credible. This principle does not, of course, apply to black operations at all, nor does it exclude white operations like the sonic deception plan that covered the Normandy invasion, given their enormous prospective gains.

The further generalization may perhaps be offered that the longer the time range of white propaganda the greater the need for credibility. In tactical situations, deceptive white propaganda is usually a mere feint; it is addressed chiefly to the opposing military command, is regarded as a normal act of war, either succeeds at once or fails at once, and has no aftereffects except on the military situation itself. Strategic and political psywar are another matter. Promises made during battle and not kept after victory will rebound against the promiser. Even the Big Lie is not wholly successful in a conquered territory, unless accompanied by a ruthless disregard of human rights, a communication monopoly, and large-scale surveillance and coercion. This is perhaps the chief difference between American use of deceptive white propaganda and the use of it made by opponents of America, and brings us to the greatest argument for a strategy of truth. If America's enemies make promises they do not expect to keep, and by so doing secure the downfall of a people, they can still maintain order by police-state methods and a monopoly of propaganda. The United States does not employ police-state methods or set up propaganda monopolies. Thus America must be very careful about the long-range implications of its day-to-day white propaganda.

Even the most vigorous proponents of the strategy of truth do not insist on a strategy of the whole truth, of course, and this is really where the two viewpoints come together. In World War II and in Korea the United States omitted some unflattering truth and emphasized some more favorable truth. American operators told the truth they thought would contradict some of their opponents' allegations and ignored other truth that might not. They felt then, as most psywar planners feel now, that they are under no obligation to help America's enemies win the propaganda battle. Moreover, the target sometimes won't believe the truth anyway, as is illustrated by the following:

What the Voice of America has to say about workers' housing conditions is no less phony and unconvincing . . . He (the commentator) wants to assure that Americans—all Americans!—live like princes. Here is the rosy picture he paints: "The American worker," he says, "lives either in a sep-

SECURITY RESTRICTED INFORMATION

write house or in a separate apartment with kitchen and bathroom. Very many married people prefer to live in the suburbs in a detached cottage with a garden." And he further asserts that the 25 percent of earnings paid in rent includes gas and telephone and even carpet-cleaning. Carpets, of course, are mentioned here not by chance. The Voice of America wants to insinuate that carpets are as common a thing in America as gas rings.

Although it was true that prisoners in American POW camps received eggs for breakfast, further testing showed us that this notion was so preposterous to the Germans on the other side of the firing line that they simply laughed at the idea. Since this discredited the balance of our message, it became another favorable truth which we learned to suppress. The same, incidentally, applied to an important strategic propaganda theme, that of war production. We had to refrain from telling the Germans that Henry Kaiser put ships together in five days. Although this spectacular fact was true, we had to stress the less spectacular and more general fact that we were building several times the tonnage sunk by the U-boats. Intelligence on what the Germans believed, and what they could be expected to believe, forced us to do this.

Eventually, as the result of extensive prisoner interrogations, a basic theme on POW treatment was worked out, which found its widest application on the Western Front. Instead of picturing captivity in the U.S. as the outrageous idyll which it really was, we used the slogan: "It's no fun being a prisoner-of-war!" and went on to show that it was a grim but tolerable fate for anyone who had fought hard but who nevertheless had been unable to evade capture. We did point out, however, that being a prisoner had certain redeeming features. The punch line to this type of appeal was: "Better Free Than a Prisoner-of-War, Better a Prisoner-of-War Than Dead." That line proved highly effective. Understatement, in this instance, was probably the only viable means of communicating with the enemy.⁵

Security

Security poses a major problem at the stage of constructing the message. The psywar officer must, as we know, have access to current intelligence, but if he is always forbidden to use the information he obtains from it, he cannot carry out his purpose effectively.

Linebarger⁹ gives a classic example of what happens to psywar when security gets too much in the way. The following are actual instructions given to US psywar officers in the Pacific during World War II:

"... Use the occasion of the Sacred Banyan Tree Festival to needle the Provisional President. Make a dramatic story of the President's life. Undermine his use of religion to bolster the dictatorship.

"Caution: do not mention religion. Do not engage in scurrilous personal attacks. Material concerning our information of the President's biography is highly classified and must not be used."

SECURITY **RESTRICTED** INFORMATION

Now obviously, in the face of such instructions, the assignment ought never to have been given at all. Yet this is not an isolated case or an atypical one. Any experienced psywar operator can recall times when security kept from him the information he needed to wage a successful campaign. The problem is worse because much actual propaganda writing is done on a fairly low echelon, from which much classified information is automatically withheld. The theory of psywar can only point out that whenever a psywar objective has been chosen, one of the first questions must be whether sufficient security-cleared information can be made available to construct an effective campaign.

TIMING THE CAMPAIGN

One of the greatest and most admired skills of the successful propagandist is his sense of when to speak and when to remain silent, when to answer and when not to answer, when to start and when to end a campaign in order to get maximum effect from it. This is partly a matter of his art, as described in earlier sections. But it is usually the result also of excellent intelligence concerning the target, plus experience in interpreting the intelligence so as to know when "the time is ripe," plus skill in exploiting the opportunity when he sees it.

We have referred several times to the Russian peace campaign of 1950 and 1951, which featured the Stockholm petition and numerous public utterances, including the talk by Malik that brought about armistice negotiations in Korea. This was a long campaign, carefully planned and spun out. Most important, it was timed with great skill. It began when some distraction was needed in order to turn the eyes of the world away from the Russians' own operations in Korea. It served both to displace the aggression of Russian and satellite subjects away from their own governments toward "capitalist-imperialist warmongers," and also to capitalize on the nationalistic anxieties of the people of Asia. Furthermore it seized the initiative from the Western Powers and threw them off balance. What more brilliant and audacious maneuver could Russia make than to cover up its own aggressive behavior with a peace movement that pulled all the stops of world anxiety about war? Operations like the North Atlantic Treaty Organization had begun as defenses against potential Soviet aggression, but by a single, well-timed stroke these defenses against Russia were themselves made to appear aggressive and

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

threatening. The Western Powers never fully recovered the initiative during this campaign.

Another example of excellent Russian timing was their proposal for a united Germany. This came at the time when it was best calculated to disrupt European rearmament and drive a wedge between France and the other Western Powers and between Western Germany and the other Western Powers. It so rocked the Western Powers back on their heels that they made no answer to the proposition for a number of days and then spoke only cautiously and defensively. In the propaganda battle for Germany this one move completely transferred the initiative and the favorable position to Russia.

Still another example of good timing, in this case in tactical psywar, occurred in Korea in the winter of 1950. Primitive psywar though it was, and reminiscent of Gideon's victory over the Midianites, still it was effective. The UN forces knew, of course, that Chinese armies were present in North Korea, but the numbers and intention of these armies were unknown. The Chinese maintained a complete nocturnal blackout until the night before the scheduled attack. At that time our reconnaissance planes returned with the report that all Communist-held Korea was afire. "The country is full of Chinese," said the troops. Next morning came the attack.

What are the decisive questions a psywar planner asks when he studies his intelligence and decides on the optimum moment to begin a campaign? Usually he asks such questions as these:

Is the iron hot? Does intelligence show that the target audience is ready for such a campaign? A campaign that reaches an audience predisposed toward the desired change will have easy going. Propaganda that can canalize and direct existing tendencies in an audience will always work faster than propaganda that must completely change and convert an audience. Therefore the "optimum time" is the time when the audience promises to be most receptive, and when the proposed messages are most likely to be successful.

Will striking now beat the enemy to the punch? In the symbol war as in the bullet war, the advantage lies with attack. "Whoever speaks the first word to the world is always right," Goebbels said. This, of course, is not always true, but the characteristics of mass communication are such that a denial or rebuttal never completely catches up with the original message. Furthermore the facts learned first in a new situation are apt to be better

273

ORO-T-214

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

remembered. Therefore many psywar strategists often prefer to launch a new attack rather than to defend themselves against the enemy's. And the experienced propagandist always tries to get there first; for example, he tells the world about a new move before the enemy has had time to report, distract, and discredit it.

Is the way open? In this respect the optimum time is whenever the campaign is likely to get adequate attention from the target audience. Is the audience distracted by other campaigns or events? Are the channels, for one reason or other, closed or clogged?

Is help coming up? The time is optimum when the first statements of the campaign themes can be reinforced in the near future, by events, by varied repetition, by related propaganda.

How much will a campaign at this time contribute to the master timetable? Whether or not the present is the optimum time will, of course, depend in part on political and military plans to which psywar is to contribute. The timetable of the responses to be expected from a campaign at this time must therefore be anticipated, and the campaign undertaken only if it fits into the timetable for the American master plan. If you will remember some of the occasions on which an advertisement has played an important part in your purchase of a new automobile or some similar article, you will probably recall that you saw the ad at a time when you were ready to consider the purchase of a new car, and probably several weeks or months before you actually made the purchase. That time interval was an important one, for it gave you a chance to absorb what you had learned, gather together a related group of attitudes, and prepare action responses for the time when you and the dealer would actually stand before a demonstration car. Similarly, Goebbels began in 1939 to soften up France and Belgium for the blitz of 1940. Tactical psywar officers feel that it is worth while to plant the seed of surrender in enemy troops even when they are far in the rear and there is no immediate likelihood of their surrendering.

An often-used trick of timing is to release a psywar communication at the precise moment that the target audience can best check its authenticity against an event that will be readily observable within the target and thus will be widely known among the target audience. The purpose, of course, is to establish the target's faith in the operator's psywar. If the audience consciously checks even a single communication and finds it to be true, then they are more likely to believe future communications.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

One of the classic questions in psywar, then, is this: When is it wise to answer or refute enemy propaganda? Some of the most interesting passages in Goebbels's diary deal with his reasons for speaking or keeping silent in the face of an enemy propaganda campaign. He tried continuously to estimate the effectiveness and the purpose of the enemy propaganda. If he felt the enemy output on a given issue was relatively ineffective, he kept silent. Likewise, if he felt that the enemy was fishing for information, he did not answer. And he did not answer if he felt he had no really effective answer, or if he felt that his reply might give greater circulation or credence to enemy claims. On the other hand he did regard it as necessary to deflate any prestige the enemy gained from claims of military successes, and to expose "blatant falsehoods" (such, he said, as the claim that the Germans had bombed Rome). Though bothered by enemy propaganda and by his inability to insulate his people from it, he still preferred, as a general proposition, to initiate his own attacks rather than defend himself against the enemy's. In this, most successful propagandists would agree with him.

How long should a campaign continue? Here intelligence about the target is really essential, for the only possible answer is, of course, that it should go on as long as it continues to be effective. In practice, several campaigns are usually in progress at the same time. As soon as one campaign begins, the psywar planner studies his intelligence from the target and begins to estimate how long he can continue to vary his campaign (in themes, messages, and media), maintain interest, and extend his effective audience. At the same time he is making plans as to what campaign should follow the one just begun. He spins out his existing campaign, gets his new campaign ready to go, and keeps a careful eye on intelligence reports concerning target response. Usually he starts the new campaign before the old one ends. In any case the time comes when the intelligence reports say to him pretty clearly that any further extension of the campaign will bring insufficient return for the effort required. Even if it would still reach a few more people, change a few more attitudes, it would do so at the cost of losing the attention of others, and taking time and energy that would now better be devoted to a new psywar purpose. There he ends his campaign.

Study of the campaigns to be described in another manual consisting of cases studied will yield some valuable suggestions on timing.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION**EVALUATING THE PRODUCT**

No psywar campaign can be considered really well planned unless it includes provisions for evaluating the content and the effect of the product.

Evaluation of the content is fairly simple. At the least, informed critical judgments should be secured on the messages in their various stages. They should be criticized for their thematic and propaganda quality, for their applicability to the target culture, and for their use (in translation or production) of the target language. In addition to this, it will be helpful if analysis of the output can be made week by week, using quantitative methods, in order to measure the proportion of time or space given to different themes, different subjects, and different devices, and to compare the output with the intention of the policy planners.

Evaluation of the effect is not at all simple. The only really satisfactory way to test the effect of psywar is to go into the target audience and find out, by interviews and observations, exactly what attitude change took place and what action was motivated. Even then, it is sometimes hard to determine just what was the "cause" of a given "effect." As was indicated in Chap. 4, attitude change is a complex process, and action may have many sources. Thus it is not always possible to estimate exactly how much credit should be given to a specific psywar operation even when the target audience is accessible.

In consolidation operations the target audience is accessible, and opinion surveys and other community studies will give the psywar operator a running record of what his material is accomplishing. In political operations it is occasionally possible to go into the target audience and make such studies, and it is sometimes possible to get opinion data that have been assembled in the target country itself, perhaps even by the target government. But the more delicate the relations between countries, and the more important it consequently becomes to evaluate the effect of a country's propaganda, the less likely the operator is to have access either to the target audience or to data obtained by others concerning it. For example, America should now have very little chance of getting such access to the Soviet Union or such data on the Russian audience. And in tactical and strategic operations the psywar operator is of course cut off even more sharply from the target he should like to study.

Thus the problem, in all types of psywar operations, is to predict or estimate the effect of a psywar operation without being able to measure freely the actual responses of the target audience.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

There are, in general, three ways to evaluate the effect of a psywar product in this difficult situation. Admittedly each one is only an approximation. None of them is as satisfactory as an uninhibited study of the target audience itself would be. Yet an evaluation of what psywar is accomplishing is so enormously important to planning and practice that any psywar operation stands to gain tremendously from whatever it can learn from these methods.

Experts

The simplest of these methods is the jury of experts. These should be persons who are thoroughly acquainted with the target country, its culture, and its people. They should preferably have lived in the target country for a long time and should have left it only very recently. Ideally they should be natives of the target country. Their absolute loyalty to the country that wants to use them as jury members must, however, be beyond question.

The procedure is for this jury to be asked to read or listen to the psywar material being directed at the target in question and predict what its effect will be within the target. Will it attract attention? Will it be understood? What reaction will it produce? Will it be accepted and believed? Will it change any minds or lead anyone to take the action desired? How could it be made more effective?

The jury, of course, can be asked to pretest as well as to posttest the psywar output. That is, a leaflet designed for the target can be shown to the jury before it has been disseminated, and the criticisms and predictions of the experts can be used either in revising it or in deciding when and where to disseminate it. This is also possible, though less convenient, in the case of radio broadcasts.

The report of the jury will be valid only to the extent that the jury is truly expert, that is, to the extent to which it can put itself in the place of the target audience and anticipate the processes by which the audience will respond to the psywar material.

Sample of Persons

A second method of evaluation is the use of a sample of persons as similar as possible to the target audience. These can be refugees, defectors, POWs, or other natives available to the psywar planners. Continuous effort should be made to match the sample as closely as possible to the actual target audience. For

ORO-T-214

277

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

example, if there is any reason to think that different groups within the target might react in different ways to the propaganda, then representatives of each of these groups should be included in the sample. Thus if three-fifths of the target population is illiterate, a sizable proportion (ideally, three-fifths) of the sample should be illiterate, so that their reactions will be reflected more prominently in the results than the reactions of literates. If there is a powerful trade union group in the target, with opinions and probable reactions of their own, then trade unionists should be represented in some such proportion in the sample.

Ideally, then, the sample should be a perfect miniature of the target audience. The picture as regards sex distribution, age distribution, geographical distribution, occupation distribution, economic status, educational levels, political viewpoints, etc., should be the same, in other words, as within the target. Practically, this is very hard if not impossible to achieve. It is considerably harder to put together a reliable miniature sample than to put together a panel of experts, for the miniature sample is only as good as it is really representative.

But if a representative sample can be obtained, then very useful results can be expected. The procedure is simply to expose the panel to the psywar material, and find out, from responses to before-and-after questions, what happens to the readers or listeners. Did they read or listen to all of it? What did they think of it? Did they understand it? Did they change any opinions as a result of it? What made them believe it, or kept them from believing it?

There are some real dangers involved in both methods, even when the experts using them are really expert and the sample is really representative. One of these dangers is that the members of the jury or the sample may give the opinions they think the questioner wants to hear. This is especially likely when the respondents are impoverished and insecure (for example, refugees, defectors, and prisoners highly dependent on the income or preferment promised them for their cooperation and perhaps reluctant to criticize the questioners' propaganda unfavorably). It is still more likely when prisoners of war are used for the jury or the sample, since they may give deliberately false answers in the hope of making the propaganda ineffective. The evaluators must therefore investigate potential jury or sample members as carefully as possible before retaining them, and subsequently test them from time to time with, for example, deliberately planted propaganda that is known to be poor or to differ in some important

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

way from the material previously given them, so as to find out whether their answers change with the changing material.

Enemy Sources

The third kind of evaluation consists of a number of techniques all of which in one way or other belong under the rubric of intelligence. The psywar unit should use every available avenue of intelligence in its attempt to find out about the effects of its propaganda on the target. Here are some of the ways in which intelligence sources can be used:

Undercover Agents. These can be used as participant observers to report on the way psywar material is being received in their areas, and on the effects it produces. This is perhaps the most reliable single device, since the agent can discuss the psywar with members of the target audience, listen in on conversations about it, and observe any actions that appear to result from it. All this calls, of course, both for an able agent and a good channel through which he can report.

Prisoners of War. These can be interviewed soon after capture, and they can be asked what psywar material has come to their attention, what their own reactions are to it, what are the reactions of their fellow soldiers and superior officers, and what is the general state of opinion and morale in their military units.

Routine Intelligence. News, intercepted letters, captured documents, statistical reports, and information from defectors and other persons interviewed can and should be screened for information bearing upon the effectiveness of our psywar.

The Enemy's Actions. These often tell us something about the effects of our psywar messages. For example, variations in the number of surrenders are often revealing. So are the enemy's countermeasures. His counterpropaganda, monitored and analyzed, sometimes tells us which of our campaigns are proving especially bothersome. In the case of broadcasting, the programs he joins may tell us what we are accomplishing with what messages.

No psywar unit will rely on any one of these methods exclusively. Not to use all possible evaluative information out of available intelligence is inexcusable. Any operation will be able, without too much trouble, to set up a small jury of expert observers; a representative sample is not beyond the resources of most field operations. But the information obtained from any

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

one of these methods ought to be checked against what comes from the others; for example, what the jury says about a leaflet ought to be checked as often as possible with POWs who are being interviewed, and also with the information that comes out of the target country. When the judgments from the various methods tally, the presumption in favor of their validity is greatly increased.

SUMMARY

You are aware by now that the large number of variables affecting psywar make psywar decisions immensely difficult. Although what are required above all by the operator in making psywar decisions are the skill and judgment that come with experience, the beginning or student psywar operator can acquire a framework in which to organize any experience he may acquire in this phase of the work by keeping clearly in mind the major variables that must be weighed and considered. If necessity requires it, this knowledge may even permit him to make the decisions for any operation he may be performing. These variables are choice of campaign, purpose, target, channel, message, timing, and means of evaluation.

Affecting the choice of campaign are priority of points of policy, applicability or inapplicability of psywar to particular policy points, the number of campaigns possible, the availability of tools and channels, the probable effectiveness of the various possible campaigns, and the risks that any campaign will bring to friends in the target country or to future credibility in the target country.

Affecting the choice of purpose are the situational, cultural, or psychological peculiarities of the target and also the interrelations between purpose, target, media, and message. Purpose derives from objective, and objective derives from policy, but purpose is also inseparable from the target.

Affecting the choice of target are determination of the specific attitude formation (or change) and action desired and determination of the individuals or groups within the target capable of bringing about the desired response. The latter may require vast and detailed knowledge of the target's social structure.

From this information the psywar operator will construct a complete statement of the characteristics—a target analysis—of the "propaganda man" he is trying to reach.

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

Affecting the choice of the channel for the message is, first, a knowledge of all the various media that might be used, that is, face-to-face public speaking or private conversation, use of events to communicate a message, gimmicks, fast media (radio and public-address loudspeakers), medium-speed media (leaflets, newspapers, and posters and newsheets), and slow media (books, magazines, pamphlets, and movies). Given the message, the target, and a complete knowledge of the media, the operator usually need only answer the media questions (Medium prominent in target's focus of attention? Accessible to operator? Suitable to purpose and message? Dangerous to friends in the target country? Able to reach largest percentage of target?) to make obvious the appropriate medium.

Affecting composition of the actual message are an understanding of the nature of symbols, an empathic approach, choice of black or white, true or false, and security considerations. You have seen that an effective message invites attention early to a personality need; establishes an atmosphere of authenticity, authority, and consistency; stays in people's minds; provides targets for aggression or identification, emulation, or love; arouses emotions beneficial to the objective of the message; and repeats, with variations.

Affecting the timing of the campaign are answers to such questions as: Is the iron hot? Will striking now beat the enemy to the punch? Is the way open? Is help coming? What will the campaign contribute to the master timetable?

And, finally, evaluation of the product is effected by a jury of persons expert in the target country, culture, and people; by samples of persons similar to the target audience; and by such enemy sources as undercover agents, POWs, routine intelligence, and the enemy's actions.

Clearly, this is one of the crucial chapters of this book, one that will bear not only study and restudy but also numerous practical exercises on the points it covers.

SECURITY **RESTRICTED** INFORMATION

TRENDS IN PROPAGANDA, 1914-1945

1. Propaganda during World War II exhibited, on the whole, a higher degree of sobriety than propaganda during World War I; the incidence of highly emotionalized terms was probably lower.
2. Propaganda during World War II was, on the whole, less moralistic than propaganda during World War I; the incidence of preference statements as against fact statements was probably lower.
3. Propaganda during World War II tended to put a moderate ceiling on grosser divergences from presently or subsequently ascertainable facts, divergences that were more frequent in propaganda during World War I. Also, propaganda during World War II tended to give fuller information about relevant events than propaganda during World War I. . . .

The use of emotionalized language was, at the outset of World War II, almost completely absent in British propaganda. When, in the autumn of 1939, Mr. Churchill, then First Lord of the Admiralty, referred to the Nazis as "Huns," thus using the stereotype current during World War I, he was publicly rebuked. Basically, that attitude persisted throughout the war in Britain and the United States. "We don't want to be driven into hate" was the tenor of opinion. There were modifications of this attitude: in the United States in regard to Japan, in Britain after the severe onslaught of bombing. However, hate campaigns remained largely unacceptable. In Germany, a similar attitude persisted: attempts of German propaganda to brand the bombing of German cities by British and later by American planes as barbarism, to speak of the crews of these planes as "night pirates" and of German raids against Britain as retaliatory largely failed to arouse indignant hate.

The waning power of moral argumentation in propaganda is best illustrated by the fact that one of the predominant themes of propaganda during World War I played no comparable part in World War II. The theme "Our cause is right; theirs is wrong" was secondary in the propaganda of the Western powers; its part in German propaganda was limited; only in Russian propaganda was its role presumably comparable to that it had played in World War I propaganda. In the democratic countries and in Germany, the moral argumentation was replaced by one in terms of indulgence and deprivation (profit or loss): "We are winning; they are losing;" and "These will be the blessings of victory; these the calamities of defeat." There is evidence indicating that both in the democracies and in Germany this type of appeal was eminently successful. In other words: success of propaganda was dependent on the transformation of super ego appeals into appeals to the ego.

The third area of difference, the increased concern for some agreement between the content of propaganda and ascertainable facts, and the increased concern for detailed information was to some considerable extent related to technological change. Thus, during World War I, the German people were never explicitly (and implicitly only much later) informed about the German defeat in the battle of the Marne in September 1914. A similar reticence during World War II would not have proved expedient, since in spite of coercive measures, allied radio transmissions were widely listened to by Germans. However, technological progress was not the only reason for the change. The concern with credibility had increased, independently of the technology of communication. The tendency to check statements of one's own against those of enemy governments existed both in Germany and in the democracies; while it was limited in Germany, it was widely spread in Britain and the United States.¹⁰

Chapter 8

A FINAL WORD

You have by now noticed that the type of decision we have been talking about in these pages is not unique to psywar. In greater or less degree such decisions lie behind all communication and in particular all communication that seeks to change attitudes or bring about action. The advertiser trying to control buying habits, the football coach trying to bring his team "up" for a big game, the revivalist trying to sway religious attitudes, the public relations counsel trying to bring about a favorable situation for his client, the political campaigner trying to sway votes, and even the teacher trying to create favorable attitudes toward learning and discrimination may each use many of the devices we have talked about, face many of the same decisions, and may even have his own type of policy direction, operational capabilities, and intelligence sources with which he must coordinate his messages if they are to accomplish as much as possible.

Yet in our political system, psywar is something distinct and different from all these activities which it resembles in so many ways. Perhaps the difference can most easily be made clear by pointing out that in a Communist state such as the Soviet Union, for example, such a distinction does not exist, or at least is much less definite. In the Soviet Union psywar outside the state merges with hardly a noticeable break into psywar within the state. The Communist educational system is merely an arm of the Party's over-all program of propaganda and agitation. In the Soviet Union the state readily uses psywar techniques to control buying habits, voting, attitudes toward the central government, and interest in sports. This merging of uses is hard for Americans to understand. For Americans, education is in large part the responsibility of the state, but it is used not to change attitudes in a state-determined direction but rather to give practice in solving problems and to impart facts and discriminative skills

ORO-T-214

287

SECURITY **RESTRICTED** INFORMATION

SECURITY **RESTRICTED** INFORMATION

which will enable the student to decide for himself what his value patterns should be. Advertising, public relations, political campaigning, and football pep talks are, except in rare instances, not the province of the US Government at all. They are private programs within the framework of commerce, politics, or play. Psywar is in a different category altogether. It represents to Americans a state imposing its will on another state. And this is why psywar has been so foreign to us, why we have been vaguely ashamed to talk about it and slow to train people to use it, and why we consider it in general a messy business, the sooner gotten over with, the better.

It is a messy business, in the same sense that war is, or economic sanctions, or any of the other weapons of international power. It is something we Americans do not practice on our own people. It is something we do not confuse with education. It is something we should prefer not to use even internationally, and indeed we look forward to the time when the nations of the earth can elevate their conflicts to the level of discussion and when it will be unnecessary to use the power weapons. But meanwhile we are caught up in a tense world situation in which a ruthless and powerful aggressor threatens peace and security. Like Nazi Germany, Communist Russia and her allies use psywar with skill and put very large resources in money and manpower into it. Even in "cold" war we are placed in the position of having to defend ourselves against psychological attack in many parts of the world. Whenever the cold war has turned hot, psywar has been used by both sides as one weapon in the power arsenal.

Therefore, no matter what our wishes and feelings about psywar may be, we are in the position of having to use it. If we Americans use such a weapon, it behooves us to know how it works and how to use it as well as possible. The purpose of this volume is to help us along toward such knowledge.

FOREWORD

The history of armed conflict amply demonstrates the efficacy and value of psychological operations (PSYOP) across the range of military activity. Performing the critical tasks of preparing and influencing the battlespace psychologically, PSYOP are an integral part of today's aerospace strategy, especially in relation to broader information operations (IO).

Air Force PSYOP forces support US national and military objectives through planned operations to convey information to target audiences. PSYOP provide a low-cost, high-impact method to deter adversaries and obtain the support of friendly or neutral target audiences. The effective use of PSYOP can provide asymmetrical advantages by exposing and exploiting adversaries' resistance and psychological weaknesses to create uncertainty and ambiguity, thereby lowering their morale and will to fight and win. In combination with military operations, PSYOP can encourage popular discontent with the adversary's leadership and degrade the enemy's ability to conduct military operations.

Psychological operations are an effective and integral component of information warfare and provide a vital contribution to the Air Force core competency of information superiority. When integrated with other activities, PSYOP maximize effects on the enemy and on their ability to make decisions.

INTRODUCTION

A wise man learns from his experience; A wiser man learns from the experience of others.

Confucius

PURPOSE

Air Force Doctrine Document (AFDD) 2-5.3 provides Air Force doctrine for psychological operations (PSYOP). It supports basic aerospace doctrine and basic information operations (IO) doctrine contained in AFDD 2-5, *Information Operations*. It replaces Air Force PSYOP doctrine outlined in AFDD 2-5.5, dated 22 February 1997. This AFDD implements Air Force Policy Directive (AFPD) 10-13, *Air and Space Doctrine*. This document is consistent with and complements Joint Publication (JP) 3-53, *Doctrine for Joint Psychological Operations*, but its purpose is to promulgate the Air Force perspective on psychological operations. As such, it focuses on how Air Force assets can be organized, trained, equipped, and operated to conduct and support PSYOP.

APPLICATION

This AFDD applies to all Air Force military and civilian personnel (includes AFRC and ANG units and members). The doctrine in this document is authoritative but not directive; as such, this doctrine will be followed except when, in the judgment of the commander, exceptional circumstances dictate otherwise. Therefore, commanders need to consider not only the contents of this AFDD, but also the particular situation when accomplishing their missions.

SCOPE

This document discusses PSYOP organizations, command and control relationships, air campaign planning, and support considerations. It also covers how aerospace assets can support and conduct joint PSYOP across the range of military operations.

CHAPTER ONE

GENERAL

PSYOP are an integral part of military operations and, as such, are an inherent responsibility of all military commanders.

JP 3-53, Doctrine for Joint Psychological Operations

BASIS

A 1983 National Security Decision Directive began the revitalization of a US military PSYOP capability, as well as directing the development of a PSYOP Master Plan. The 1985 PSYOP Master Plan, in turn, required the Armed Forces to develop both joint and Service PSYOP doctrine. The updated 1990 PSYOP Master Plan directs each Service to evaluate and, if necessary, amend its PSYOP doctrine to ensure it supports and is compatible with joint PSYOP doctrine. In 1993 (updated in 1996), the Joint Staff published JP 3-53, *Doctrine for Joint Psychological Operations*, which requires each Service to develop PSYOP doctrine for assigned primary functions. Since then, numerous documents including joint and Service doctrine manuals, Universal and Joint Mission Essential Task Lists, Chairman of the Joint Chiefs of Staff (CJCS) Instructions and Department of Defense (DOD) Directives were released directing each Service to develop, train, equip and employ PSYOP as a mission essential task.

PSYCHOLOGICAL OPERATIONS

JP 1-02, *DOD Dictionary of Military and Associated Terms*, defines psychological operations (PSYOP) as

Planned operations to convey selected information and indicators to foreign audiences to influence their emotions, motives, objective reasoning, and ultimately the behavior of foreign governments, organizations, groups, and individuals. The purpose of psychological operations is to induce or reinforce foreign attitudes and behavior favorable to the originator's objectives.

The Air Force may attain United States (US) national and military objectives through PSYOP designed to convey selected information to targeted audiences. *PSYOP are systematically employed to induce or reinforce foreign attitudes and behavior favorable to US objectives.* While the Air Intelligence Agency (AIA) and Air Force Special Operations Command (AFSOC) are assigned primary PSYOP responsibilities within the Air Force, almost all aerospace forces have the inherent capability to support PSYOP. Because PSYOP are an integral part of US military operations, US Air Force forces must be prepared to support PSYOP objectives in support of global engagement across the range of military operations.

PSYOP APPROVAL PROCESS

PSYOP campaigns are initiated and conducted under strict guidelines. Policy approval authority for peacetime PSYOP rests with the National Command Authorities (NCA) or the Office of the Undersecretary of Defense for Policy and is delegated to the Assistant Secretary of Defense for Special Operations and Low Intensity Conflict. *During war, this approval authority may be delegated to the warfighters;* e.g., theater commanders in chief (CINCs) or joint task force (JTF) commanders. *This authority may not be further delegated* and must be followed by all forces employing or conducting PSYOP.

FUNCTIONS OF PSYOP

JP 3-53, *Doctrine for Joint Psychological Operations*, indicates each Service has the following functions for PSYOP:

- ✳ Provide civilian and military personnel with appropriate PSYOP training and planning skills, as needed.
- ✳ Provide organic capabilities to execute PSYOP actions to include forces and equipment.
- ✳ Develop Service PSYOP doctrine relating to the primary functions assigned to that Service.
- ✳ Provide PSYOP forces or detachments (not assigned to Commander in Chief, United States Special Operations Command [USCINCSOC]) to combatant commanders.
- ✳ Request additional PSYOP support from the CJCS PSYOP executive agent (USCINCSOC).

- ✧ Provide departmental intelligence and counterintelligence assets who are trained, equipped and organized to support planning and conduct PSYOP.
- ✧ Train and educate departmental personnel to counter and neutralize the effects of hostile foreign PSYOP.

Air Force PSYOP support national and military objectives by conveying specially tailored information to target audiences. PSYOP provide aerospace forces a considerable advantage by exploiting the adversary's psychological weaknesses to create uncertainty, fear, and confusion, thereby lowering the opposition's morale and the will to fight.

PSYOP provide a low-cost, high-impact tool to deter adversaries and obtain the support of friendly or neutral target audiences. Air Force doctrine also recognizes that PSYOP are integral to information operations—and, indeed, can have a synergistic effect on the battlespace when used in combination with other information operations. PSYOP can encourage popular discontent with the opposition's leadership and, by combining persuasion with a credible threat, degrade an adversary's abil-

Aerospace assets are versatile. They can quickly spread information over large areas and through many channels.

ity to conduct or sustain military operations. They can also disrupt, confuse, and protract the adversary's decision-making process, undermining command and control.

PSYOP RELATIONSHIP TO INFORMATION OPERATIONS

Information plays a vital role in warfare, particularly in relation to command and control. Successful commanders understand the critical need to maintain the flow of information up and down the chain of command while at the same time influencing the perceptions, attitudes, and reasoning of the adversary. IO strategy includes both lethal and non-lethal means of enabling friendly aerospace forces to operate more quickly and effectively than their adversary. *A basic objective of IO is to lessen the ability of the opposing force to assess and respond to a battlespace situation while preserving, and perhaps enhancing, the ability of friendly forces to do so.* The object, generally, is to interrupt or protract the adversary's decision cycle (defined by Colonel Boyd, Air Force officer and military theorist, as the observe, orient, decide, and act, or OODA, loop). *By using IO effectively, in a manner that influences or even controls the adversary's perceptions, commanders can shape the battlespace.* A strategy of fully integrating IO operationally can result not only in information dominance but can maximize combat power and deter hostilities as well.

The Air Force believes that dominating the information spectrum is as critical to conflict now as controlling air and space or occupying land was in the past and is seen as an indispensable and synergistic component of aerospace power. Information superiority—the degree of dominance that allows friendly forces the ability to collect, control, exploit, and defend information without effective opposition—is an Air Force core competency upon which all the other core competencies rely. In order to gain and maintain information superiority, the Air Force conducts robust IO and executes its two major aspects: information-in-warfare (IIW) and information warfare (IW). IO comprise those actions taken to gain, exploit, defend, or attack information and information systems. IIW involves the Air Force's extensive capabilities to provide global awareness throughout the range of military operations based on its integrated intelligence, surveillance, and reconnaissance (ISR) assets; its information collection and dissemination activities; and its global navigation and positioning, weather, and communications capabilities. IW consists of the function of counterinformation (CI) and its two subsets, offen-

sive counterinformation (OCI) and defensive counterinformation (DCI). As figure 1.1 depicts, PSYOP issues fall within both OCI and DCI.

Figure 1.1 PSYOP are part of Information Warfare

Although PSYOP is a component of offensive counterinformation, it is important to understand that its purpose may be offensive or defensive. Choosing to strike targets that demoralize an opponent and shorten a conflict is an offensive use of PSYOP. Informing a foreign populace that US military forces are removing old land mines to build support for those forces and aid force protection is a defensive use.

PSYOP are one type of military action that supports IO goals. Employed independently, PSYOP can have a measurable effect on the adversary. If their military potential is to be maximized, however, *PSYOP cannot be conducted in a vacuum; rather, they must be woven into the strategies and operations of joint and multinational forces.*

CHAPTER TWO

AIR FORCE PSYCHOLOGICAL OPERATIONS FRAMEWORK

The supreme excellence is not to win a hundred victories in a hundred battles. The supreme excellence is to subdue the armies of your enemies without even having to fight them.

Sun Tzu

GENERAL

PSYOP are a vital part of the broad range of US political, military, economic, and informational activities. Psychological operations are guided by certain enduring principles and objectives. This chapter provides the framework which guides Air Force participation in PSYOP.

CATEGORIES OF PSYOP

As an integral part of US military response options, PSYOP are effective at all levels of warfare. Air Force aerospace forces can support and conduct PSYOP activities across the range of military operations. *Just as it is important to understand the differences between the PSYOP categories (strategic, operational, tactical, and consolidation), it is also important to understand that they may overlap.* There are no clear divisions between the start and end of a particular category of PSYOP. Actions in each category may start, stop, and restart during a campaign. These categories are intended to convey capabilities rather than outline employment guidelines. *Determination of the appropriate category, type, and method of PSYOP is the responsibility of the PSYOP planner.* With the narrowing of space and time due to technological advances, one cannot simply state that an action is strategic or tactical. For example, a target selected in part for its psychological impact on a tactical situation could have a more strategic effect on the adversary's will to fight; if a "tactical" leaflet is picked up and broadcast by an international news agency, the message may take on strategic significance.

Strategic

Strategic PSYOP are conducted on a global or regional basis in support of US goals and objectives. PSYOP may take many forms, to

include diplomatic positions, announcements, or communiqués. An increase in US military presence provides a powerful psychological message. Accordingly, the US may send an aerospace expeditionary task force (ASETF) to convey a message of US resolve and act as a powerful deterrent to foreign aggression. Strategic PSYOP are conducted predominantly outside the military arena but can utilize DOD assets and be supported by military PSYOP and other air operations (e.g., bombers were deployed to Guam and Diego Garcia to influence Iraqi leadership to allow on-site inspections.)

Operational

Operational PSYOP in Operation DESERT STORM

During Operation DESERT STORM, Air Force C-130s dropped leaflets and broadcast radio messages warning Iraqi soldiers that they would be bombed by the world's largest conventional bomb. The next day, the joint force commander (JFC) employed a series of BLU-82 airdrops. Shortly thereafter, the C-130s dropped leaflets announcing additional BLU-82 airdrops. The combination of the leaflets, radio broadcasts, and bombs were subsequently credited with directly causing a significant number of Iraqi desertions

Operational PSYOP are conducted in a defined geographic area to promote the effectiveness of a theater commander's objectives as well as theater campaigns and strategies. These operations

are designed to strengthen US, allied, or coalition capabilities to conduct military operations in the theater and accomplish particular missions during crises and open hostilities. *They are conducted prior to and during war or conflict, and at the conclusion of open hostilities.* At the operational level, aerospace PSYOP can identify targets or centers of

gravity with the greatest potential for psychological impact. Additionally, aerospace efforts may include leaflet drops, loudspeaker broadcasts, and airborne radio or television transmissions designed to encourage enemy forces to defect, desert, flee, or surrender, or undertake any other activity supportive of US objectives. *Additionally, if potential adversaries can be favorably influenced by PSYOP, confrontations may be avoided.* These efforts may also enhance force protection by influencing the local populace to report terrorist, sabotage, or other plans to attack US or friendly forces, thereby enabling the US to counter those plans. Persistent offensive attacks can have a synergistic effect with PSYOP accelerating the degradation of morale and encouraging desertion.

Tactical

Tactical PSYOP are normally conducted in conjunction with other tactical operations against opposing forces or audiences. *At this level, PSYOP are normally targeted for individual engagements.* Planners tailor persuasive communications, in a variety of media formats, for the foreign target audience. During Operation JUST CAUSE, Air Force aircraft supported tactical ground forces by broadcasting radio and television messages urging the Panamanian populace to remain in their homes—and out of harm's way. In similar situations, Air Force assets can be employed to broadcast radio, TV, and loudspeaker messages which may influence a wider audience.

Consolidation

Consolidation PSYOP aim to strengthen, or consolidate, US efforts in a given region. *Conducted in foreign areas where United States forces are operating and where an enemy or potentially hostile populace is also present,* consolidation PSYOP help influence the foreign populace to support US local objectives and allow the supported commanders operational freedom. Consolidation PSYOP may be particularly effective during foreign internal defense operations. For example, if US forces are helping a foreign government to remove land mines, PSYOP could publicize the effort to gain support from the local populace, hence

Air Force assets conduct and support all four categories of PSYOP.

creating a safer working environment for US personnel. Additionally, this would gain support for the foreign government as they are seen working to benefit their people.

PSYOP PRINCIPLES

Certain principles should be adhered to for effective employment of Air Force forces in support of either long- or short-term PSYOP. While the methods may vary with the target audience, the basic considerations are the same.

Figure 2.1. PSYOP Principles

- ✧ **Define clear PSYOP objectives** corresponding to the supported commander's vision of how the campaign should proceed. The objectives should be consistent with concurrent diplomatic, economic, political, informational, or multinational efforts. *A key PSYOP objective is to decrease the enemy's will to resist.* The psychological dimension of warfare affects those fighting the battle, their political and military leaders and staffs, and the civilian population. During military operations, US personnel prefer facing enemies who are unsure and confused about their cause and capabilities and certain of an impending defeat. Even if the enemy is unwilling to surrender, they may be influenced not to engage in combat. This goal may be difficult but, if possible, pays high dividends for US forces.
- ✧ **Base PSYOP themes, activities, and symbols on a thorough analysis of targets**, including friendly and adversary PSYOP capabilities, strengths, and weaknesses.
- ✧ **Use transmission medium or media which are reliable and readily accessible by target audiences.** US forces must ensure message media are tailored for the local populace. Media can range from leaflets, to posters, to radio, television, and digital broadcasts. E-mail, mass e-mail, and web page postings take advantage of newer technologies and may also be used to influence an audience. *Planners should ensure transmission media can reach and be understood by the target audience.*

- ✧ **Evaluate results for their relevance to the overall campaign objectives.** The commander's decision to terminate or revise PSYOP programs should be linked to the analysis of all-source intelligence. All friendly actions should be thoroughly evaluated for psychological implications, and where necessary, should be supported by deliberate PSYOP actions to offset potentially negative effects or to reinforce positive effects. To the extent possible, PSYOP should be tested in advance of use to determine possible outcomes.

PSYOP OBJECTIVES

Effective PSYOP provide the NCA and joint force commander (JFC) unique leverage by influencing targeted foreign groups, key political and military leaders, and governments to act in a manner compatible with US goals and objectives. *PSYOP are low-cost, high-impact tools which allow the JFC to directly communicate with and influence an adversary or selected foreign audience.* By implanting the correct message in an enemy's mind, PSYOP may preclude the need to employ additional combat forces. When combat is unavoidable, effective PSYOP can reduce the period of conflict. PSYOP, a nonkinetic weapon within the IO arsenal, can magnify the political, military, and economic instruments of national power. PSYOP objectives can be categorized into three main areas: general, military operations other than war (MOOTW), and war.

General

- ✧ Reduce the efficiency of opposing forces.
- ✧ Advance US or multinational efforts by modifying or influencing attitudes and behaviors of selected audiences.
- ✧ Obtain the cooperation of multinational partners and neutrals.

Military Operations Other Than War

- ✧ Support the elements of US national policy objectives, national security strategy, and national military strategy.
- ✧ Modify the behavior of selected target audiences toward US and multinational capabilities.
- ✧ Support the theater CINC's regional security strategy objectives.
- ✧ Support the objectives of the country team.

- ★ Promote the ability of the host nation to defend itself against internal and external threats.
- ★ Gain and sustain foreign popular belief in, and support for, US and multinational goals and objectives.
- ★ Deter adversary powers or groups from interfering with friendly operations or initiating actions detrimental to the interests of the US or its multinational partners.
- ★ Increase foreign popular support for US and multinational military operations.
- ★ Support other IO elements.
- ★ Diminish the legitimacy and credibility of the adversary political system.
- ★ Shift the loyalty of adversary forces and their supporters to friendly powers.
- ★ Diminish support and increase reporting of terrorist, sabotage, or other attack plans against US activities and resources outside the continental United States.
- ★ Publicize beneficial reforms and programs to be implemented after defeat of the adversary power.
- ★ Support and enhance foreign humanitarian assistance, foreign internal defense, and foreign nation assistance military operations.
- ★ Facilitate reorganization and control of occupied or liberated areas in conjunction with civil-military operations.

War

- ★ Project the image of a strong, technologically superior, well-prepared US military force that will win on the battlefield and protect the US, its friends, and multinational partners whenever necessary.
- ★ Foster an understanding of US political policies, aims, and objectives.
- ★ Foster support for multinational operations.
- ★ Arouse foreign public opinion or political pressures for (or against) a military operation.
- ★ Undermine confidence in adversary leadership.

- ★ Lower the morale and combat efficiency of adversary forces.
- ★ Increase the psychological impact of US and multinational combat power.
- ★ Support other elements of IO.
- ★ Counter hostile foreign psychological operations and propaganda efforts.
- ★ Influence the development of adversary strategy and tactics.

Powerful Effects of PSYOP

...incessant aerial pounding can break a unit without destroying all, or even a majority, of its parts. The real limit is the ability of the troops to absorb the pounding, since individual decisions to cease fire will eventually render the unit useless tactically. Soldiers may desert (leave their unit and go home), defect (present themselves as prisoners), or, if unable to leave the killing ground, desert in place, that is, consciously or unconsciously cease to be a functioning member of the unit. Backing up the aerial bombardment by specific suggestions through psychological operations radio, leaflets, and loudspeakers can speed up the process if the bombardment is perceived as personally threatening by the members of the unit. ...Iraqi prisoners were very specific about the effect the bombing of other units within earshot had on their combat capability and morale. ...They also confirmed the importance of random bombing in inducing helplessness and surrender among enemy troops before launching a ground assault.

Gulf War Air Power Survey, 1993

- ★ Amplify economic and other nonviolent forms of sanctions against an adversary.

COMMANDER'S RESPONSIBILITIES

As an integral part of the joint team, air commanders should be aware of the unique contributions aerospace power makes to PSYOP. *Commanders need to recognize that although they may not command dedicated PSYOP units, they possess aerospace, communications, and computer equipment that may prove extremely valuable in achieving PSYOP objectives.* Commanders need to evaluate the potential psychological effects and implications of all contemplated courses of action, addressing both intended and unintended consequences of military operations. Commanders should also ensure their staffs understand how PSYOP support can be

obtained from national and theater resources, and how they are applied to Air Force mission objectives. Finally, commanders should realize that PSYOP are most effective when planning is done early and in conjunction with broader information operations planning and the overall air campaign planning process. *Early planning and employment of PSYOP is essential.*

CHAPTER THREE

COMMAND AND CONTROL, AND ORGANIZATION

The courage and morale of an army have always increased its physical strength, and always will.

Carl von Clausewitz

GENERAL

Air Force PSYOP command and control arrangements should be flexible to adapt to different requirements. Because of its strategic and operational importance, PSYOP planning is normally centralized at the combatant command level. Similarly, when the combatant commander activates a subordinate joint force (subordinate unified command or JTF), PSYOP planning is normally centralized within a joint psychological operations task force (JPOTF) at that level. Air Force PSYOP planners on the theater PSYOP staff should coordinate closely with the theater joint force air component commander (JFACC) staff to enhance effectiveness, ensure compliance with NCA direction, and to coordinate and deconflict PSYOP messages.

COMMAND

JFCs delegate the appropriate level of authority in accordance with guidelines in JP 0-2, Unified Action Armed Forces. JP 0-2 details the assignment and purposes of the different types of command authority, including combatant command (command authority) (COCOM), operational control (OPCON), tactical control (TACON), support, and coordinating authority.

OPERATIONAL CONTROL CONSIDERATIONS

Joint force commanders normally exercise OPCON of assigned and attached PSYOP forces through the subunified or component commander best suited for successful mission support and execution. *US Air Force conventional air assets are normally under the OPCON of the Commander, Air Force Forces (COMAFFOR), who should normally be designated the JFACC. Special operations forces (SOF) aviation assets, including PSYOP-dedicated assets, normally remain under the OPCON of the joint force special operations component commander (JFSOCC) or the commander of the joint spe-*

cial operations task force (JSOTF). OPCON of SOF aviation is exercised through the joint special operations air component commander (JSOACC). The commander of the JPOTF normally exercises TACON of US Air Force assets when performing the PSYOP mission.

ORGANIZATION OF PSYOP FORCES

The organization of PSYOP forces is generally dictated by the nature and scale of the joint PSYOP mission. The organization may vary depending on the nature of the mission, the availability and qualification of assets and personnel, and the supported commander's assess-

Figure 3.1. Typical command relationship for a JPOTF

ment of the PSYOP requirement. To assess the situation, the supported commander may request a PSYOP assessment team. This team confers with the commander, develops the PSYOP objectives, and recommends the appropriate component mix of personnel and equipment to accomplish the mission.

If the team determines that additional PSYOP forces are required to accomplish the JFC objectives, a JPOTF may be required. *The JPOTF normally remains under the control of the JFC to provide a centralized PSYOP focus* (see figure 3.1). If a JPOTF is established, Air Force planners should be prepared to advise JPOTF personnel on Air Force PSYOP capabilities to ensure smooth planning, coordination, and mission execution. Targeting and the application of aerospace forces to achieve PSYOP objectives are key aspects of Air Force PSYOP.

AIR RESERVE COMPONENT FORCES

The majority of US PSYOP capability is maintained in the reserve components. *When mobilized (selective, partial or full mobilization), a significant portion of the Air Force's PSYOP capability becomes available for employment by the supported combatant commander.* Early identification and activation of Air Reserve Component (ARC) PSYOP forces is essential to ensure forces arrive on time, fully prepared to conduct required PSYOP. Both active and reserve forces which provide PSYOP capability should be identified in the theater time-phased force and deployment data (TPFDD) to ensure theater PSYOP objectives and operations are not delayed.

Air Intelligence Agency

The Air Intelligence Agency is the “functional manager” for psychological operations in the Air Force. Headquarters (HQ), AIA has responsibility for PSYOP activities not already assigned to HQ USAF/Director of Intelligence, Surveillance, and Reconnaissance (XOI) and HQ Air Force Special Operations Command (AFSOC). AIA will assign PSYOP-trained IO specialists to the information operations flights at selected numbered air forces (NAFs), theater air component commands, or standing AOC organizations. AIA will also make available a PSYOP reach-back capability.

USAF MAJCOMs/Theater Air Components/NAFs

Selected MAJCOMs with in-garrison or active AOC organizations, selected theater air components, and selected NAFs will have a

PSYOP-trained IO specialist, normally assigned to an information operations flight. In times of conflict, the PSYOP-trained personnel should be assigned to the information warfare specialty team in the AOC. PSYOP officers ensure PSYOP targets supporting the CINC's theater PSYOP campaign and recommended by the JPOTF are integrated and sourced as part of the daily air tasking order.

CHAPTER FOUR

AIR FORCE PSYCHOLOGICAL OPERATIONS PLANNING AND EXECUTION

PSYOP contributed significantly to the collapse and defeat of the Iraqi army.

*Conduct of the Persian Gulf War
Final Report to Congress
April 1992*

GENERAL

The Air Force has unique characteristics that allow application of aerospace power in a broad range of mission areas. Although PSYOP messages have traditionally been associated with written and verbal communications, aerospace power can support theater PSYOP efforts in three primary ways. First, *psychosocial criteria can be part of the target development process*, ensuring that aerospace power achieves maximum psychological effect. Second, *specially equipped Air Force aircraft can transmit messages* over communications media such as radio and television or can airdrop leaflets. Third, *US aircraft, by their dynamic presence and actions, transmit an unmistakable psychological message* to most adversaries. The mere threat or presence of superior Air Force aircraft can ground an enemy's air force and demoralize their army and civilian population or promote stability. Air Force satellites and aerial reconnaissance photos can also be used to support PSYOP targeting and discredit adversary claims or intentions. Finally, *aerospace power can be used to "bomb for effect."* Examples include: use of massive and persistent bombing of military targets; use of the BLU-82, precision-guided munitions to destroy specific targets; as well as use of unopposed high-speed, low-level ingress or egress flights for noise and shock value. Aerospace power is versatile—using it to further theater PSYOP objectives is one valuable application of that power.

CENTRALIZED PLANNING

PSYOP, like other information operations, rely on a synergistic application of all tools to gain the desired effect. **Planning joint air support for PSYOP should be conducted by the information warfare specialty team integrated into the joint air operations center (JAOC).**

*This is accomplished through extensive coordination by Air Force PSYOP planners working with the JPOTF, if established. PSYOP messages must be coordinated with other elements of IO (such as public affairs, counterintelligence, deception, and operations security [OPSEC]) and with information warfare planners to ensure consistency to achieve the desired effects. When developing strategies and long-range plans, air campaign planners should consider PSYOP when employing aerospace power to achieve theater objectives. Lethal use of airpower may have a resulting significant psychological impact, but this by-product of air operations should not automatically be considered PSYOP. PSYOP are approved operations with the express purpose to influence the attitudes, emotions, motives, reasoning, and ultimately the behavior of a targeted audience. **Anything we do to an opponent, intended or unintended, may have a psychological effect, but—PSYOP are planned applications of action to achieve or exploit a desired effect.***

PSYOP AND THE AIR CAMPAIGN PLANNING PROCESS

The JFC should consider conducting PSYOP using aerospace power to achieve theater objectives. Theater PSYOP will be planned by the JPOTF and integrated into the air campaign by air planners. PSYOP planners must be aware of deception operations, electronic warfare, and other information operations that could negatively affect PSYOP (or vice versa) on the same target, target area, or target population. *As with other Air Force capabilities, air campaign planners should consider and integrate PSYOP throughout planning and execution of the air campaign.*

Air campaign planners employ Air Force PSYOP capabilities to exploit culturally-based values, symbols, and behaviors; historical themes; past war experiences; military doctrines; and the personal idiosyncrasies of leaders to target an adversary's political, economic, and military systems. Ultimately, campaign planners employ PSYOP to defeat the enemy's strategy. Part of the air campaign planning process involves determining the centers of gravity (COG). *Enemy COGs can be attacked directly or indirectly.* Direct attacks physically attack a COG and engage it in decisive combat. Indirect attacks cause the downfall of the COG by attacking its supporting elements until the COG collapses of its own weight or is rendered ineffective. *Because PSYOP target adversary's attitudes, emotions, reasoning, and behavior, and are not necessarily intended to destroy the enemy, these operations are normally considered indirect operations.*

COMMANDO SOLO is dedicated to PSYOP and civil affairs broadcasting.

The ultimate goal of the air campaign planning process is an effective air campaign which achieves theater objectives. The air campaign plan harmonizes and integrates joint air operations in support of joint force objectives. The planners identify COG targets, prioritize them, indicate the level of effort, and phase required missions in relation to the JFC's plan (and in relation to each other). The plan typically contains traditional Air Force missions such as strategic attack, counterair operations, interdiction, close air support, and maritime support operations. However, *this is also an opportunity to integrate Air Force assets fully in support of other uses of airpower, such as PSYOP. Trained PSYOP planners ensure psychological factors and objectives are considered when developing the air campaign plan.*

INTEGRATING AIR FORCE PSYOP INTO THE JOINT PSYOP CAMPAIGN

Air Force PSYOP must be closely coordinated with the joint PSYOP planning staff. The JPOTF, if activated, is responsible for managing and integrating theater PSYOP and for ensuring component operations are consistent with theater PSYOP objectives. If a JPOTF is not formed, a clearly identifiable and empowered PSYOP representative should be present and active in all planning activities. *Independent operations could*

undermine theater PSYOP objectives, and degrade overall JFC objectives. Once JFC objectives are known, Air Force PSYOP opportunities and options will be identified and recommended to the JPOTF or the joint PSYOP staff. *Air Force or air component planners may develop PSYOP products, but the JTF commander or the commander, joint psychological task force (COMJPOTF) must approve the products prior to use.*

Air Force PSYOP planning is conducted within the information warfare (IW) specialty team assigned to the JFACC staff. The team has expertise from all major IO disciplines and is responsible for integrating IW, including PSYOP, into an overall JFACC air campaign. The IW team is the JFACC's conduit to both the special operations liaison element (SOLE) for EC-130 COMMANDO SOLO expertise, and to the Air Force liaison officer to the JPOTF.

The Psychological Impact of Airpower

Coalition strategy also benefited immensely from psychological operations, the success of which is evidenced primarily by the large number of Iraqi soldiers who deserted Iraqi ranks or surrendered without putting up any resistance during the ground offensive. Our efforts built on, among other factors, the disheartening effect on Iraqi troops of the unanswered and intensive Coalition aerial bombardment, the privations they suffered due to the degradation of the Iraqi logistic system, and the threat of the impending ground campaign. Radio transmissions and leaflets exploited this demoralization by explaining to the Iraqi troops how to surrender and assuring them of humane treatment if they did. More specific messages reduced Iraqi readiness by warning troops to stay away from their equipment (which was vulnerable to attack by precision munitions) and induced desertions by warning troops that their positions were about to be attacked by B-52s.

*Conduct of the Persian Gulf War
Final Report to Congress
April 1992*

PSYOP FORCES IN MILITARY OPERATIONS OTHER THAN WAR

Aircrew members and support personnel trained to conduct or support PSYOP for combat operations normally do not require additional training to conduct PSYOP for MOOTW. *However, there may be requirements for unique support capabilities, such as intelligence personnel, political military affairs personnel, and other area specialists.* Through humanitarian operations, PSYOP can align foreign governments with the US, thus averting possible future confrontations.

Employment of PSYOP is not only a wartime option. Aircrew members and support personnel hone their wartime skills through training, exercises, and other “peacetime” activities. PSYOP may be employed, either overtly or covertly to gain support, prevent hostility or support long term national objectives. *To be most effective, PSYOP must be exercised and employed frequently in all environments.* It should become almost an unconscious act to employ PSYOP in all activities involving any sized military force.

Specialized training allows PSYOP personnel to understand a potential adversary’s thought process and to predict possible enemy and friendly actions to manipulate favorable outcomes. As during war, personnel participating in MOOTW must have a thorough understanding of the rules of engagement (ROE). Tightened ROE further challenge military support during peacetime engagement. Rules may be so constrained that use of conventional forces and means are not possible. Judge advocates advise personnel on legal issues, including rules of engagement—PSYOP participants should seek advice from assigned judge advocates regarding applicable ROE. AFDD 2-3, *Military Operations Other Than War*, provides detailed guidance on employing aerospace assets during MOOTW.

CHAPTER FIVE

AIR FORCE PSYOP SUPPORT AND PLANNING CONSIDERATIONS

True economy of force is using the indirect approach to effect a psychological defeat without engaging in actual combat.

Liddell Hart

INTELLIGENCE

Effective PSYOP actions depend upon timely and accurate intelligence information. Although intelligence personnel may be assigned to and deploy with dedicated PSYOP units, they rely heavily on external intelligence sources and systems. Air Force units which may be tasked to support PSYOP objectives should be cognizant of the intelligence required and available to achieve those objectives. *Because the threat situation and PSYOP requirements are constantly changing, intelligence personnel need access to near-real-time, all-source intelligence* from Service (Air Intelligence Agency), theater (joint intelligence centers), and national (Defense Intelligence Agency and National Air Intelligence Center) intelligence components. Forward deployed expeditionary forces must have sufficient communications connectivity with these supporting agencies to ensure responsive reachback and timely information exchange. *More importantly, intelligence participation in PSYOP requires an extensive peacetime or precrisis/conflict commitment to intelligence preparation of the battlespace.*

Air Force human intelligence (HUMINT) personnel with target country language capability may be available to assist in the planning, deployment, and execution of a PSYOP mission. HUMINT personnel provide cultural understanding, foreign area expertise, and language skills which are necessary to work with coalition forces and foreign nation government and civilian entities.

Simply put, PSYOP require a broad array of military, political, social, and economic intelligence on potential adversaries. The rapid nature of warfare presents a significant challenge for collecting, analyzing, and displaying this intelligence during the crisis or conflict phase of an operation. In addition, “damage assessment” presents an equal or greater challenge to intelligence personnel in the PSYOP arena than to those en-

gaged in strategic attack, interdiction, or close air support operations. Intelligence personnel should identify in advance the sources of information they can call upon to help assess the effectiveness of PSYOP. Collection, analysis, and reporting procedures should be developed, coordinated, and practiced until they are institutionalized and personnel are proficient. For additional intelligence information, see AFDD 2-5.2, *Intelligence, Surveillance, and Reconnaissance Operations*.

COMMAND, CONTROL, COMMUNICATIONS, AND COMPUTERS

Command, control, communications, and computers (C4) systems facilitate the execution of command and control (C2) and its supporting functions. C4 systems are essential for planning, mounting, and sustaining successful joint PSYOP. Rapid, reliable, redundant, and secure communications between staffs and components are required for planning and conducting successful joint PSYOP. PSYOP communications should be structured to support centralized control and decentralized execution. *Air Force PSYOP communications should be integrated with the joint PSYOP secure voice, data, and satellite networks.* Communica-

Space-based capabilities make our PSYOP forces more effective. Voice communications and data transfer provided by this MILSTAR satellite are only one example.

tions and computer resources (information technology including visual information technology) must be designed to support electronic generation, distribution, and dissemination of PSYOP information against selected targets as an extension of information warfare.

By their nature, PSYOP demand high capacity, secure command, control, communications, computers, and intelligence (C4I) systems to gather, analyze, prepare, staff, and distribute PSYOP products. Although they possess sophisticated PSYOP support and communications systems, *PSYOP forces rely on other agencies and systems for essential information and intelligence.*

LOGISTICS

Air Force PSYOP planners should provide sustainment requirements to Air Force logisticians during both deliberate and crisis action planning. Before any PSYOP plan is executed, planners need to coordinate all aspects of logistics supportability. *Logistics planners work closely with joint operations planners to bring operating supplies, repair parts, and major end-items for PSYOP-peculiar equipment into the theater.* This should ensure continuous sustainment and support of the PSYOP plan; it also will ensure requirements are included in the operation plan or operation order TPFDD.

Since most PSYOP involve operating from deployed locations, **dedicated Air Force PSYOP units develop mobility packages by establishing unit type codes (UTCs)** consisting of operations, intelligence, maintenance, and other support personnel required to manage deployed Air Force PSYOP. These UTCs should be built to respond to requirements across the range of military operations.

To ensure timely notification of Air Force PSYOP units and assets, MAJCOMs with dedicated PSYOP assets should ensure resources are identified in the appropriate TPFDD. While UTCs are normally placed in regional TPFDDs, forces should be ready to respond to all requirements. Air Force PSYOP forces should be able to execute time-sensitive deployments. Dedicated PSYOP units can deploy with minimal organic logistics support, contributing to their mobility, flexibility, and responsiveness. Additional maintenance and support personnel, as well as associated equipment, normally require airlift support or surface transportation for deployment. Air Force PSYOP assets should also be adequately supported by readiness spares packages for extended deployments.

OPERATIONS SECURITY

Air Force PSYOP forces should be prepared to respond to sensitive taskings and to maintain the strictest OPSEC requirements. *Security of information is vitally important to PSYOP forces from initial deployment through the recovery phase.* OPSEC denies the enemy valuable information about friendly capabilities and intentions, including advance notice of mission unique training, joint preparations, deployment, and employment. Air Force personnel do this by identifying, controlling, and protecting indicators and actions associated with planning and conducting military operations and activities. *Failure to implement an effective OPSEC program could result in mission compromise and loss of personnel and resources.*

MILITARY DECEPTION

All warfare is based on deception.

Sun Tzu

In a sophisticated battle environment, the JFC will use the necessary tools to accomplish the mission. One effective means of gaining an advantage over the enemy is to build military deception into battle plans and individual missions. **Air Force PSYOP forces must ensure military deception does not adversely affect the credibility of PSYOP.** PSYOP and deception both can create significant holes in the enemy's morale and fighting capability. PSYOP and military deception can be employed separately; however, military deception plans can take advantage of PSYOP themes to enhance planning opportunities. *Therefore, coordination is imperative between military deception and PSYOP planners.* Imaginative application of deception principles, coupled with aggressive training and execution, can result in improved combat effectiveness at all levels, particularly when employed synergistically with PSYOP.

LEGAL

PSYOP personnel will seek the advice of the assigned judge advocate in connection with the political and legal implications of their operations. Commanders at all levels must consult their legal advisors on the legal aspects of specific operations. *Commanders must keep*

their legal advisors informed on all aspects of plans, policies, directives, and doctrine.

TECHNOLOGICAL CONSIDERATIONS

As potential enemies become increasingly sophisticated, their levels of technology, communications, and mass media will mature. **The Air Force dedicated PSYOP capability needs to keep pace with future threat environments** by ensuring its forces are equipped with state-of-the-art acquisitions and upgrades. These new technologies should enhance the joint PSYOP capability, ultimately degrading the enemy's fighting capability. *Effective integration of new Air Force PSYOP technologies will reduce the number and severity of future lethal engagements.*

PSYOP forces need to defend their critical information and support systems. Alternate production and delivery methods must be identified. PSYOP personnel should be capable of switching quickly from sophisticated (high technology based) to unsophisticated (manually produced) products if required.

METEOROLOGICAL AND OCEANOGRAPHIC CONSIDERATIONS

Timely and accurate meteorological and oceanographic (METOC) information is important for success of PSYOP missions and must be considered and implemented during all phases of planning and execution. *METOC conditions can degrade or enhance PSYOP* depending upon the extent of effects and how well they are considered in the planning process. Air Force units participating in PSYOP should have ready access to METOC information required to plan and conduct PSYOP and to achieve theater PSYOP objectives. PSYOP should be supported by a single coordinated mission forecast produced by a centralized METOC unit that is tailored to the specific mission needs by METOC personnel at the mission execution level. Timely and accurate launch, recovery, and target area forecasts will enhance the decision-making process by allowing PSYOP personnel to use the weather to minimize exposure to threats. *Key forecast elements include (but are not limited to) weather hazards to air operations, target wind profiles, atmospheric and space environment effects on electromagnetic propagation, atmospheric effects on acoustic propagation, and target area precipitation.* Rapid, reliable communications for conveying information between METOC units and PSYOP forces are essential.

TARGETING

PSYOP planners should understand how campaign plans are implemented through targeting and the daily ATO process. Since Doolittle's raid on the Japanese homeland, it has been clear that the targets of aerospace power should be considered for psychological impact as well as destructive effect. Otherwise, attacks upon an adversary are not optimized. Access to the targeting planning process allows PSYOP planners to analyze all targets and determine possible PSYOP impacts and effects. PSYOP must be quick to respond to changes on targets and to develop tailored products to exploit opportunities. When possible, combining lethal and nonlethal targets will greatly improve effectiveness.

To be effective, PSYOP must reach their intended audience. Although some means involve indirect contact, many other PSYOP actions or products require direct contact. To this end, PSYOP planners must be familiar with the various means of tailoring and delivering the PSYOP message. Chief among these are standoff broadcasts and hardcopy products that have traditionally represented the art of persuasive communication in the battlespace. Air Force assets are essential to deliver these PSYOP products. With the explosion of electronic media, however, new and perhaps more efficient applications will emerge.

Each Air Force PSYOP planner must understand the requirements for PSYOP targeting. Knowledge of leaflets and leaflet delivery containers as well as the delivery characteristics of bombs is important; all are part of normal target planning. Weather planning is another important consideration. As new methods and systems are developed, PSYOP planners, along with other Air Force targeting personnel, must practice planning and procedures.

Reaching an Audience

Leaflets and other forms of printed PSYOP proved especially effective in terms of audience penetration. Of the targeted audience—300,000-plus Iraqi troops—calculations based on enemy prisoner of war (EPW) interviews suggest that approximately 98 percent read or were otherwise exposed to the 29 million leaflets dropped in theater. Most EPWs were found clutching leaflets in their hands or hiding them somewhere in their uniforms.

Gulf War Air Power Survey, 1993

NUCLEAR, BIOLOGICAL, AND CHEMICAL CONSIDERATIONS

PSYOP assets are not equipped to conduct sustained operations in nuclear, biological, and chemical (NBC) environments. Planners must consider the effects of NBC environments and plan for limited operations, or select alternate locations for PSYOP product production and delivery.

CHAPTER SIX

PREPARATION FOR PSYOP

If we should have to fight, we should be prepared to do so from the neck up instead of from the neck down.

Jimmy Doolittle

COMMANDER'S RESPONSIBILITIES

Commanders of units that routinely conduct or support PSYOP should ensure their personnel are familiar with the principles, objectives, and responsibilities outlined in this document. Airmen and support personnel need to understand how their operations contribute to the JFC's overall PSYOP campaign. Additionally, commanders should continually evaluate their training programs to ensure realistic aircrew training meets known operational taskings and supports joint PSYOP interoperability concepts. AFDD 2-4.3, *Education and Training*, provides guidance on training and educating aerospace forces.

TRAINING

Air Force units should participate in joint training which emphasizes command and control arrangements and joint interoperability, as well as joint tactics, techniques, and procedures required to conduct the PSYOP mission. As an example, Air Force units tasked to conduct leaflet operations should be familiar with joint coordination procedures, ballistic information (provided by requester), computer procedures, and dispersion characteristics for leaflets they may airdrop. In addition, these units should conduct training airdrops to evaluate their capability.

It is important to point out that PSYOP training is not only for PSYOP units. All mission planners should understand PSYOP objectives and consider how their missions can best support those objectives. This does not imply that PSYOP are all-important, but rather that all effects must be weighed when selecting courses of action.

EXERCISES

Air Force PSYOP personnel and assets should be scheduled to participate regularly in Joint Chiefs of Staff (JCS) and other PSYOP-related exercises. *The top priority should be to participate in exercises providing realistic training for aircrew, staff, and support personnel.* Participation in exercises with insufficient PSYOP participation or without realistic training wastes valuable time and resources and may unnecessarily limit the availability of scarce PSYOP resources for real-world requirements. Exercise planners need to consider participation in command post exercises to train PSYOP staff and liaison personnel. Liaison personnel should be employed not only for individual training but to advise other staffs of Air Force PSYOP capabilities and limitations.

WARGAMING, MODELING, AND SIMULATION

Wargaming, modeling, and simulation can be used to examine and demonstrate the utility of dedicated PSYOP forces and conventional forces supporting PSYOP objectives to affect the outcome of joint operations. These useful tools save thousands of dollars in deployment costs and are also valuable for training staff and liaison personnel.

As with other indirect effects, PSYOP are difficult to assess in wargames.

Accurately modeling the effects of PSYOP is difficult. Cross-cultural, personalities, and other human factors must be considered. Continued development of these models is needed to predict effectiveness of specific PSYOP measures on differing individuals under varied conditions.

EDUCATION

Air Force personnel who plan, coordinate, or conduct PSYOP should attend specially developed PSYOP courses. Responsibility for joint PSYOP training belongs to the Joint Staff and United States Special Operations Command (USSOCOM) as the executive agent. Certain MAJCOMs conduct courses specifically aimed at meeting these training requirements. Personnel who may be involved in PSYOP support should receive a general orientation on PSYOP execution and capabilities.

USSOCOM	United States Special Operations Command
UTC	unit type code

Definitions

battlespace. The commander's conceptual view of the area and factors that he must understand to successfully apply combat power, protect the force, and complete the mission. It encompasses all applicable aspects of air, sea, space, and land operations that the commander must consider in planning and executing military operations. The battlespace dimensions

can change over time as the mission expands or contracts according to operational objectives and force composition. Battlespace provides the commander a mental forum for analyzing and selecting courses of action for employing military forces in relationship to time, tempo, and depth. (AFDD 1)

centers of gravity. Those characteristics, capabilities, or localities from which a military force derives its freedom of action, physical strength, or will to fight. (JP 1-02) [*They exist at the strategic, operational, and tactical levels of war.*] {Italicized portion in brackets applies only to the Air Force and is offered for clarity.}

combatant command (command authority). Nontransferable command authority established by title 10 ("Armed Forces"), United States Code, section 164, exercised only by commanders of unified or specified combatant commands unless otherwise directed by the President or the Secretary of Defense. Combatant command (command authority) cannot be delegated and is the authority of a combatant commander to perform those functions of command over assigned forces involving organizing and employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction over all aspects of military operations, joint training, and logistics necessary to accomplish the missions assigned to the command. Combatant command (command authority) should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through subordinate joint force commanders and Service and/or functional component commanders. Combatant command (command authority) provides full authority to organize and employ commands and forces as the combatant commander considers necessary to accomplish assigned missions. Operational control is inherent in combatant command (command authority). Also called **COCOM**. See also operational control; tactical control. (JP 1-02)

consolidation psychological operations. Psychological operations conducted in foreign areas inhabited by an enemy or potentially hostile populace and occupied by United States forces, or in which United States forces are based, designed to produce behaviors by the foreign populace that support United States objectives in the area. (JP 1-02)

doctrine. Fundamental principles by which the military forces or elements thereof guide their actions in support of national objectives. It is authoritative but requires judgment in application. (JP 1-02)

EC-130 COMMANDO SOLO. An airborne electronic broadcasting system utilizing the EC-130E aircraft. COMMANDO SOLO conducts PSYOP and civil affairs broadcasts in the standard AM, FM, HF, TV, and military communications bands. (Special Operations Forces Reference Manual)

information-in-warfare. Involves the Air Force's extensive capabilities to provide global awareness throughout the range of military operations based on integrated intelligence, surveillance and reconnaissance (ISR) assets; its information collection/dissemination activities; and its global navigation and positioning, weather, and communications capabilities. Also called **IIW**. (AFDD 2-5)

information operations. Actions taken to affect adversary information and information systems while defending one's own information and information systems. Also called **IO**. (JP 1-02) The Air Force believes that in practice a more useful working definition is: *[Those actions taken to gain, exploit, defend or attack information and information systems and include both information-in-warfare and information warfare.]* {Italicized definition in brackets applies only to the Air Force and is offered for clarity}. (AFDD 2-5)

information superiority. The capability to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same. Also called **IS**. (JP 1-02) The Air Force prefers to cast 'superiority' as a state of relative advantage, not a capability, and views IS as: *[That degree of dominance in the information domain which allows friendly forces the ability to collect, control, exploit, and defend information without effective opposition.]* {Italicized definition in brackets applies only to the Air Force and is offered for clarity.} (AFDD 2-5)

information warfare. Information operations conducted during time of crises or conflict to achieve or promote specific objectives over a specific adversary or adversaries. Also called **IW**. (JP 1-02). The Air Force believes that, because the defensive component of IW is always engaged, a better definition is: *[Information operations conducted to defend one's own information and information systems, or to attack and affect an adversary's information and information systems.]* {Italicized definition in brackets applies only to the Air Force and is offered for clarity}. (AFDD 2-5)

joint air operations center. A jointly staffed facility established for planning, directing, and executing joint air operations in support of the joint

force commander's operation or campaign objectives. Also called **JAOC**. (JP 1-02)

joint force special operations component commander. The commander within a unified command, subordinate unified command, or joint task force responsible to the establishing commander for making recommendations on the proper employment of special operations forces and assets, planning and coordinating special operations, or accomplishing such operational missions as may be assigned. The joint force special operations component commander is given the authority necessary to accomplish missions and tasks assigned by the establishing commander. The joint force special operations component commander will normally be the commander with the preponderance of special operations forces and the requisite command and control capabilities. Also called **JFSOCC**. (JP 1-02)

joint psychological operations task force. A joint special operations task force composed of headquarters and operational assets. The joint psychological operation task force assists the joint force commander in developing strategic, operational, and tactical psychological operation plans for a theater campaign or other operations. The joint psychological operations task force may have conventional or special operations psychological units assigned or attached to support the joint task force commander. Also called **JPOTF**. (JP 1-02)

joint special operations task force. A joint task force composed of special operations units from more than one Service, formed to carry out a specific special operation or prosecute special operations in support of a theater campaign or other operations. The joint special operations task force may have conventional nonspecial operations units assigned or attached to support the conduct of specific missions. Also called **JSOTF**. (JP 1-02)

military deception. Actions executed to deliberately mislead adversary military decision makers as to friendly military capabilities, intentions, and operations, thereby causing the adversary to take specific actions (or inactions) that will contribute to the accomplishment of the friendly mission. The five categories of military deception are: 1. strategic military deception—Military deception planned and executed by and in support of senior military commanders to result in adversary military policies and actions that support the originator's strategic military objectives, poli-

cies, and operations. 2. Operational military deception—Military deception planned and executed by and in support of operational-level commanders to result in adversary actions that are favorable to the originator's objectives and operations. Operational military deception is planned and conducted in a theater of war to support campaigns and major operations. 3. Tactical military deception— Military deception planned and executed by and in support of tactical commanders to result in adversary actions that are favorable to the originator's objectives and operations. Tactical military deception is planned and conducted to support battles and engagements. 4. Service military deception—Military deception planned and executed by the Services that pertain to Service support to joint operations. Service military deception is designed to protect and enhance the combat capabilities of Service forces and systems. 5. Military deception in support of operations security (OPSEC)— Military deception planned and executed by and in support of all levels of command to support the prevention of the inadvertent compromise of sensitive or classified activities, capabilities, or intentions. Deceptive OPSEC measures are designed to distract foreign intelligence away from, or provide cover for, military operations and activities. (JP 1-02)

operational control. Transferable command authority that may be exercised by commanders at any echelon at or below the level of combatant command. Operational control is inherent in combatant command (command authority). Operational control may be delegated and is the authority to perform those functions of command over subordinate forces involving organizing and employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction necessary to accomplish the mission. Operational control includes authoritative direction over all aspects of military operations and joint training necessary to accomplish missions assigned to the command. Operational control should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through subordinate joint force commanders and Service and/or functional component commanders. Operational control normally provides full authority to organize commands and forces and to employ those forces as the commander in operational control considers necessary to accomplish assigned missions. Operational control does not, in and of itself, include authoritative direction for logistics or matters of administration, discipline, internal organization, or unit training. Also called **OPCON**. See also **combatant command (command authority)**; **tactical control**. (JP 1-02)

psychological operations. Planned operations to convey selected information and indicators to foreign audiences to influence their emotions, motives, objective reasoning, and ultimately the behavior of foreign governments, organizations, groups, and individuals. The purpose of psychological operations is to induce or reinforce foreign attitudes and behavior favorable to the originator's objectives. Also called **PSYOP**. (JP 1-02)

public affairs. Those public information, command information, and community relations activities directed toward both the external and internal publics with interest in the Department of Defense. Also called **PA**. (JP 1-02)

special operations forces. Those active and reserve component forces of the military Services designated by the Secretary of Defense and specifically organized, trained, and equipped to conduct and support special operations. Also called **SO**. (JP 1-02)

special operations liaison element. A special operations liaison team provided by the joint force special operations component commander to the joint force air component commander (if designated) to coordinate, deconflict, and integrate special operations air and surface operations with conventional air operations. Also called **SOLE**. (JP 1-02)

tactical control. Command authority over assigned or attached forces or commands, or military capability or forces made available for tasking, that is limited to the detailed and, usually, local direction and control of movements or maneuvers necessary to accomplish missions or tasks assigned. Tactical control is inherent in operational control. Tactical control may be delegated to, and exercised at any level at or below the level of combatant command. Also called **TACON**. See also **combatant command (command authority); operational control**. (JP 1-02)

FOREWORD

Psychological factors are an integral part of all battlefields. Each unit movement and every conquest of terrain psychologically affect the battlefield participants and an audience of friendly, neutral, or hostile groups. The psychological effect of combat actions can be seen in the heightened morale of a successful unit or in the discouragement and fear of a defeated unit. Properly manipulated attitudes can modify the behavior and the combat effectiveness of the soldier and the unit.

This manual provides information and guidance for the conduct of psychological operations (PSYOP) in general, limited, and cold war. The doctrine, techniques, and procedures found herein are applicable to conventional warfare, unconventional warfare (UW), and foreign internal defense (FID) operations. This manual should be used in conjunction with other official manuals and publications that provide staff organization procedures and guidance for doctrine, field operations, and maintenance of equipment.

This manual is divided into two parts:

Part One is an easy-to-read, ready reference for the combat commander and tells what psychological operations can do and how they can be used to achieve a quicker victory, conserve valuable resources, and save the lives of US and friendly personnel.

Part Two is for the PSYOP commander, unit, and staff personnel and others with an interest in or need for the details of psychological operations.

Definitions of PSYOP basic terms are in appendix H.

Users of this manual are encouraged to submit comments and to recommend changes for its improvement. Comments/recommendations should be keyed to the specific page and line of text and be fully explained. Forward your comments to the **Commandant, US Army Institute for Military Assistance, ATTN: ATSU-TD-TS, Fort Bragg, NC 28307.**

The use of the pronouns "he," "his," "himself," etc., in this manual includes both masculine and feminine genders. Any exception to this will be so noted.

1

BACKGROUND

MAJOR PSYOP EFFORTS SINCE WORLD WAR II

Since World War II, the major PSYOP effort of the United States has been by the Department of State (STATE); subsequently, the United States Information Agency (USIA) which included the Voice of America (VOA); and now the International Communication Agency (ICA) which replaced USIA.

During the Korean conflict, organization and techniques for tactical PSYOP improved. In the Vietnam action, much PSYOP activity was initiated, emphasized, and refined.

The Joint United States Public Affairs Office (JUSPAO) was created by the National Security Council (NSC) in 1965 to centralize PSYOP policy and insure control of PSYOP activities in Vietnam. Formed at the counselor level in the Embassy, this joint office included representatives from civilian and military US Government agencies. In addition to carrying out the normal mission of the United States Information Service (USIS), the JUSPAO provided PSYOP policy and direction to the US and Free World Assistance Forces in the Republic of Vietnam (RVN).

To insure unity of effort, PSYOP plans of the United States and Vietnam were coordinated at the national level (US Embassy and Government of Vietnam). Coordinating committees were also formed at the region and province level.

As the result of the adoption of a central manager concept (centralized guidance and decentralized execution), all policy stemmed from one source--JUSPAO at the Embassy--with operational discretion permitted at lower levels of command.

Technical advances which increased the PSYOP potential included:

Standardized propaganda developed by JUSPAO was available to tactical units by air delivery to major distribution points.

Printing facilities out of country produced mass printings of leaflets and newspapers.

Master catalogs of themes were distributed. (Upon request, these themes were made into leaflets.)

Television was first used as an instrument of strategic propaganda.

A small adapter named "Early Word" made it possible for airborne transmission of PSYOP appeals directly through an aircraft-mounted loudspeaker system. A radio signal received by the aircraft could be simultaneously taped in the aircraft for further replay.

Tactical limitations depended only on the range of the ground transmitter and the enemy air defense system.

Support to tactical operations was modernized. Loudspeaker support was readily available to ground commanders who could easily adapt themes to their particular situation (i.e., search and destroy operations, among others).

PSYOP TODAY

Today US Army Reserve (USAR) PSYOP units furnish PSYOP support and expertise to the active army. Several Army commands have established mutual support agreements with specific USAR units to augment active army units for combat.

PSYOP RESPONSIBILITIES

THE ARMED SERVICES

Each of the military services provides forces to accomplish its assigned PSYOP mission. Although the US Army has the principal US military PSYOP capability, other services can support the PSYOP efforts. Coordination among all military services and government agencies is required to insure unity of effort, uniformity of policy, and adequacy of coverage.

JOINT CHIEFS OF STAFF (JCS)

The Joint Chiefs of Staff serve as advisers and military staff in the operational chain of command for unified and specified commands. They provide a channel of communications for the President and Secretary of Defense to unified and specified commands, and coordinate all communications in matters of joint interest addressed to these commands. Under this authority, US Army PSYOP forces assigned to theater army or corps in times of crises or during a state of hostilities are placed under operational control or in support of the commander of the unified command. Through the JCS or the unified command, US Army PSYOP units may be tasked to assist other US military or civilian agencies.

DEPARTMENT OF THE ARMY

Department of the Army develops PSYOP resources to support general, limited, cold war, and foreign internal defense. In DA, the Deputy Chief of Staff for Military Operations

(DCSOPS) has staff responsibility for PSYOP. US Army PSYOP resources include command and staff personnel, units, advisers, and equipment. The flow of PSYOP policy from the Chief Executive to the US Army elements is depicted in figure 1-1.

DEPARTMENT OF THE NAVY

Although the Department of the Navy does not have forces dedicated to PSYOP, it can support psychological operations with conventional forces and equipment.

OTHER SUPPORT

Other government and private agencies can assist and cooperate in PSYOP activities, particularly during foreign internal defense operations. Private organizations engaged in education, health, disaster relief, cultural, and missionary work can be of great assistance.

FIGURE 1-1
PSYCHOLOGICAL OPERATIONS POLICY FLOW

UNITED STATES INFORMATION AGENCY (USIA)

In 1953 the USIA was established as an independent arm of the Government's Executive Branch, and most of the functions previously vested in the Secretary of State were transferred to the Director, USIA. Later acts expanded the duties and responsibilities of USIA. Title V, Section 501, Public Law 402, designated the USIA as the agency responsible for the preparation and dissemination abroad of information about the United States, its people and its policies, through press, publications, radio, motion pictures, and other information centers and instructors abroad. Thus, the USIA was the foreign information arm of the US Government, particularly in time of peace. As a part of its mission, the USIA aimed to:

Promote understanding, acceptance, and respect among foreign audiences for the United States and its policies.

Advise the President, his representatives abroad, and the various departments and agencies of government on public attitudes in other countries and their implications on the formulation and execution of foreign policy.

INTERNATIONAL COMMUNICATIONS AGENCY (ICA)

On 1 April 1978, the International Communications Agency was established. It consolidates the functions of the United States Information Agency and the State Department's Bureau of Education and Cultural Affairs. The core management of ICA consists of a Director, a Deputy Director, and four Associate Directors, with designated responsibilities for broadcasting (VOA), programs (PGM), educational and cultural affairs (ECA), and management (MGT).

The internal structure of the Voice of America remains essentially unchanged, but the elevation of the VOA Director gives recognition to the importance of the broadcasting service and is intended to preserve the integrity of its news operation.

The operations of the two other media elements--Press and Publications, and Motion Pictures and Television--come under the direction of the Associate Director of Programs. International exhibits, which have been shown principally in the Soviet Union and Eastern Europe, are a separate element in the same division.

In the new structure for educational and cultural exchange, a major objective is to provide clear lines of responsibility for enhancing, on the one hand, foreign access to American experiences and, on the other hand, American access to foreign experiences and culture.

Aside from the White House, ICA's relationships are primarily with the Departments of State and Defense and the Agency for International Development:

It acts in an advisory capacity toward STATE, and in turn, receives foreign policy guidance.

It works closely with DOD, particularly with the Offices of the Secretary for Public Affairs and of International Security Affairs. By agreement, ICA and DOD exchange liaison personnel at the national level and at joint commands. ICA advises on the impact of overseas public statement and actions in the defense field and cooperates directly with DOD in Washington and major commands abroad to increase support for US policies.

The Agency for International Development, under the supervision and guidance of STATE, administers economic aid abroad. ICA supports the AID mission by publicizing AID programs and accomplishments. Conversely, AID accomplishments reinforce ICA efforts.

Chapter Two

PSYOP RESPONSIBILITIES OF THE ARMY

Psychological operations derive their major effectiveness from being an integral part of a total operation. **They are neither a substitute for power nor a panacea.** When skillfully and closely integrated with actions and other instruments of power, PSYOP act as a catalyst and can often make the difference between success and failure in military operations. Psychological operations can be effectively employed throughout the entire spectrum of conflict.

THE ARMY PSYOP ROLE

Within DOD, the Army--because of its established psychological operations training base, assigned missions, and land-based operations--has the primary military role in PSYOP. As the service with the principal assets, the Army has the major role in assisting commanders of joint task forces and unified, specified, and combined commands to achieve PSYOP objectives.

The Army develops PSYOP resources to operate in general, limited, and cold war. In the field PSYOP elements are responsible for:

Planning and conducting PSYOP in support of military operations.

Developing in all Army personnel an appreciation of the role and value of PSYOP and an understanding of the psychological implications of military operations.

Planning and conducting PSYOP to support US national objectives abroad.

Interallied PSYOP policy is determined at the highest levels of government and command. At combined levels, PSYOP may be guided by standardization agreements; e.g., NATO. Where operational control of designated US Army PSYOP forces is transferred to allied commanders, directives governing the use of US PSYOP forces and equipment will be provided to the appropriate commanders.

Psychological operations are conducted by military forces under the operational control of the theater or unified command. The Army PSYOP element is commanded by the theater Army commander. PSYOP support may be initiated by PSYOP units in either CONUS or at an in-theater site, normally outside of the combat zone. Operations may be conducted concurrently from both areas. When initiated in CONUS, the theater commander provides input for the development of appropriate programs.

THE ARMY PSYOP MISSION

The Army PSYOP mission is to support US national policy; to conduct PSYOP in support of military operations; to be prepared to conduct PSYOP unilaterally in support of, or in coordination with, other military services and US Government agencies; and to give PSYOP training, advice, and assistance to US forces and friendly nations.

Specifically, Army PSYOP forces:

Assist in formulating PSYOP doctrine, tactics, techniques, and operations of Army forces, other US military services, unified commands, and other US Government agencies.

Develop Active Army and Reserve Component (RC) forces to support plans and operations of Army forces, other US military services, unified commands, and other US Government agencies.

Undertake research and development programs to further the Army's capabilities for PSYOP.

Furnish PSYOP-qualified personnel for liaison and military training teams (MTTs).

Must be prepared to conduct these operations unilaterally in support of, or in coordination with, other military services and US Government agencies.

Must be prepared to provide equipment and area-oriented, language-qualified PSYOP personnel to train, advise, and assist allied/friendly nations in developing their PSYOP capabilities; and must be prepared to provide PSYOP assistance in support of the operations of a host country.

Provide information and generate intelligence for PSYOP.

Develop, procure, issue, and stockpile PSYOP materiel and equipment; must be prepared to provide logistical support to US Government agencies and allied/friendly nations.

Conduct PSYOP training for members of all branches of the US Armed Forces and personnel from friendly/allied nations on a mission basis.

LIMITED WAR

Limited war, with its complex and unwritten national policy objectives, is merely an active continuum of cold war. PSYOP, therefore, require a continuation of policy and execution with a broadening of psychological objectives.

The International Communication Agency (ICA) country plan and theater military plans must be coordinated under the guidance of the US Ambassador; and the psychological operator, the policy advisor, planner, and executor, must have an "up-to-the-minute" knowledge of these plans.

GENERAL WAR

If cold or limited war progresses to general war, the US Army PSYOP elements may be required to increase their PSYOP activities. This may include use of organic equipment and facilities to replace damaged or destroyed civilian mass communications equipment and facilities.

The role of US Army PSYOP in general war is established by National Security Council (NSC) directives channeled through the Department of Defense to the Department of the Army. The role is further defined and coordinated by interagency agreements.

PURPOSE OF PSYOP

The purpose of all psychological operations is to create in foreign groups the emotions, attitudes, or behavior to support the achievement of national objectives. In this endeavor, PSYOP influence policy, decisions, the ability to govern, the ability to command, the will to fight, the will to obey, and the will to support.

Psychological operations can increase the relative combat power of friendly forces and adversely affect the combat power of the enemy. This is accomplished, basically, by attacking the identified weaknesses of the opposing forces through a planned and coordinated PSYOP campaign.

PSYOP field teams are placed in direct support (DS) of the maneuver elements and travel with them to exploit opportunities as they arise. The forward teams provide a constant flow of information to the PSYOP command element at the higher headquarters. The PSYOP unit constantly updates the PSYOP estimate, keeps the commander informed of the psychological impact of the operation, and makes recommendations for the conduct of combat operations.

As the attack progresses, the bypassed, isolated enemy elements are targeted by the field teams. The field teams use all available media to induce their surrender, thereby conserving the combat resources of the attacking force.

Tactical deception plans are supported by using misleading sound effects and by disseminating misinformation. During this time PSYOP support can enable the maneuver commander to concentrate his maneuver units while giving the appearance of maintaining normal dispersion. Operations, such as the feint or ruse, are primarily psychological since the intent is to confuse the enemy and have him react in a desired manner.

Planners, operators, and intelligence personnel require access to all available intelligence that pertains to their mission and area of operations. Effective reporting channels are necessary to insure that the flow of information reaches the PSYOP unit on a timely, uninterrupted basis.

PRINCIPLES OF EMPLOYMENT

Offensive Operations

The mission, enemy, terrain, weather, populace, and availability of troops influence PSYOP support.

PSYOP effectively support combat power.

Under certain conditions, offensive operations are conducted for their psychological impact.

PSYOP exploit the effects of friendly nuclear fires.

PSYOP increase the psychological impact of conventional operations.

PSYOP support subordinate units by facilitating exploitation of targets of opportunity.

PSYOP are coordinated with higher and adjacent units when the effects are expected to influence enemy actions outside of the unit's boundaries.

PSYOP are coordinated with the tactical fire support elements in the operational area to enhance the effectiveness of both systems.

PSYOP support tactical deception operations and other facets of the OPSEC program.

Defensive Operations

PSYOP units supporting combat units in the defense continue to maintain a PSYOP offensive. The defensive situation provides an excellent opportunity to establish credibility by factual news reporting. PSYOP missions in support of the defense include those required to:

- Prepare to resume the offense.
- Discourage an enemy offensive.
- Support forces delaying an enemy advance.
- Support the planning and conduct of counterattacks.
- Support rear area protection operations.
- Conduct PSYOP against bypassed and isolated enemy units in rear areas.
- Support tactical deception operations and other facets of the OPSEC program.

Retrograde Operations

Retrograde operations are characterized by limited offensive, defensive, and delaying tactics. PSYOP teams with heavy printing, broadcasting, and other relatively immobile equipment positioned well to the rear are able to provide uninterrupted support. PSYOP are able to support retrograde operations by:

- Publicizing civilian control measures.
- Supporting tactical deception operations and other facets of the OPSEC program.
- Exploiting the psychological effects of nuclear and nonnuclear firepower.
- Supporting counterattacks by placing emphasis on the large number of enemy casualties.

Relief Operations

PSYOP will:

- Support tactical operations and other facets of the OPSEC program.
- Remain in place to support the incoming unit.
- During a forward passage of the lines, support the attacking unit.
- During a rearward passage of the lines, remain with the covering forces.

Support of Other Types of Tactical Operations

When supporting other types of tactical operations, the basic PSYOP principles apply; however, the techniques and manner of application may vary.

Civil Affairs

PSYOP support civil affairs in offensive, defensive, retrograde, relief, and consolidation operations.

FIGURE 2-1
PSYOP SUPPORT OF A THEATER

TYPES OF PSYOP SUPPORT

Psychological operations support is type-classified according to the level of employment, location, and the physical scope of the operation. The classifications overlap. There are no clear-cut lines as to where support stops for one type operation and begins for another. A PSYOP unit may support all types of operations simultaneously. The three major classifications are:

STRATEGIC SUPPORT

Psychological operations in support of strategic operations are designed to exploit vulnerabilities in foreign military forces and populations. They are designed to **advance broad or long-term objectives**. General support (GS) forces are generally used in this role.

TACTICAL SUPPORT

Psychological operations in support of tactical operations are planned and conducted in the combat area to **achieve immediate and short-term objectives**. Normally, direct support (DS) PSYOP units are used.

CONSOLIDATION SUPPORT

PSYOP supporting consolidation operations assist in the reorientation and education of the civilian population in liberated or occupied areas. The purpose is to **facilitate military operations and obtain maximum cooperation of the inhabitants**.

PSYOP IN SUPPORT OF STRATEGIC OPERATIONS

Psychological operations in support of strategic operations are directed at large segments of the target nation's population. These psychological operations exploit economic, military, sociological, psychological, and political vulnerabilities. They are an integral part of the overall strategic scheme.

PSYOP policies and objectives are approved at the national level. Effective interagency coordination is established at all levels of government and command to insure that no conflicts exist between military PSYOP and other government activities.

Guidance for the support of strategic operations usually emanates from the National Command Authority (NCA). Psychological operations are coordinated with general strategic plans and are directed against forces, people, or areas in their entirety.

Psychological operations supporting strategic operations are normally conducted in support of the unified or specified commands. The unified command issues directives to implement the national policy and establish command policy. These operations are not limited to the area of influence of individual subordinate commanders.

Planning is a continuing process. PSYOP personnel continually evaluate the results of current operations, update current plans, and continue long-range planning to insure adequate support for future operations. Contingency plans and supporting pretested propaganda are prepared and held ready for implementation on order. It is during the planning phase that the psychological impact of a contemplated course of action must be considered. (See chapter 12, Psychological Operations Planning, for more detailed information.)

MAJOR OBJECTIVES

- Deter enemy forces from initiating hostilities or intervening in existing conflicts.
- Create concern in the enemy concerning the futility of war.
- Arouse public concern, political, and economic pressures for or against a military operation.
- Stimulate dissension among enemy rival power groups.

OTHER OBJECTIVES

- Project a favorable image of the United States.
- Foster understanding and gain acceptance of US goals and operations.
- Convince the target that the United States can fulfill its aspirations.
- Explain US policies and objectives to allied, friendly, and neutral nations.
- Strengthen determination of friends and allies.
- Build confidence of allies in the objectives of the alliance.
- Gain support of neutrals.
- Support resistance personnel.
- Gain support in liberated areas.
- Strengthen friendly leaders; weaken enemy leaders.
- Influence enemy strategy and tactics:
 - Identify and exploit enemy weaknesses.
 - Develop modifications in the character and policies of the enemy to favor the United States.
- Stress enemy racial and religious intolerance.
- Publicize and exploit enemy, racial, ethnic, and religious prejudices and intolerance.
- Build or create enemy political disunity.
- ☛ Stimulate support of opposition elements of the enemy.
- * Undermine confidence in enemy leadership and war aims.
- ☛ Interfere with control systems and communications.
- Support and foster economic and other nonviolent sanctions against the enemy military forces and civilians.
- Encourage disaffection in enemy nations among religious, ethnic, social, political, economic, and other elements.
- Support tactical operations.

CONDITIONS THAT MAY BE EXPLOITED

Military successes of friendly forces.

Shortages of food, housing, clothing, or other necessities in enemy territory or enemy-occupied areas.

Enemy manpower shortages.

Enemy country inflation.

Unequal and exorbitant taxation by the enemy government.

Lack of resources to support the enemy economy and war programs.

Enemy police state practices to include terrorism, midnight arrests, travel restrictions, and censorship.

MEDIA

The most desirable media for strategic operations are radio, television, and leaflets.

PSYOP IN SUPPORT OF TACTICAL OPERATIONS

Psychological operations are an integral and coordinated part of the overall tactical plan. They provide the tactical commander with an additional weapons system, a system that can weaken the enemy soldier's will to fight, thereby reducing his combat effectiveness, and that can prevent civilian interference with military operations. They are designed to exploit individual and group susceptibilities.

Psychological operations in support of tactical operations are planned and executed for specific operations. Targets of opportunity are exploited as they arise.

The theater Army commander, in addition to providing resources to the theater commander to conduct PSYOP in support of theater plans, provides PSYOP resources to support tactical commanders, civil affairs operations, and rear area protection.

CORPS SUPPORT

The PSYOP resources available at corps include staff officers and direct support units required to plan, develop, and execute psychological operations. The corps PSYOP staff officer, with his knowledge of the tactical operations, may be called on to provide specific recommendations to be included in theater plans.

Each corps is normally supported by a direct support battalion. The divisions, separate brigades, and regiments are normally supported by a direct support company from the corps direct support battalion. When limited PSYOP units are available, the combat elements may be supported by specific teams tailored to fit the mission.

DIVISION SUPPORT

The direct support mission of PSYOP units is to provide close, continuous, and priority support to the division and its maneuver elements; these units remain under the centralized control of the higher PSYOP commander.

The division is supported by a direct support PSYOP company consisting of a command and control team (AA); command assessment (AD); supply and maintenance (BA); propaganda development (FA); current intelligence (FC); light printing (GA); platoon headquarters, audio and visual (HA); loudspeakers (HB); and an audiovisual team (HC).

Support During Movement to Contact

During movement into a hostile area, the AD team deploys into a hostile area and analyzes and evaluates the psychological warfare possibilities to:

- Make recommendations to the ground force commander in the area of PSYOP.

- Determine what psychological functional teams should be deployed into the area.

- Evaluate the results of any psychological campaign that had been conducted prior to insertion.

- Plan the use of themes in a PSYOP campaign.

During movement to contact with enemy forces, psychological operations also focus priorities to:

- Provide a detailed and systematic examination of processed intelligence to identify and locate target audiences, identify conditions, pinpoint vulnerabilities, establish objectives, and obtain pertinent information to guide PSYOP exploitation.

- Advise on the psychological implications of planned and executed courses of action.

- Assist in tactical deception operations to support OPSEC.

- Give information and directions to friendly elements operating in the enemy combat area.

- Assure exploitation of PSYOP targets of opportunity.

- Evaluate enemy PSYOP efforts to identify psychological weaknesses, friendly and enemy.

- Promote support for short–intermediate–and long-term US and allied goals:

 - Create a favorable image of US and allied soldiers and leaders. Help control friendly and enemy civilians in the combat area.

 - Counter enemy propaganda (if appropriate) and retain the psychological initiative.

 - Support the strategic PSYOP mission by furnishing detailed and timely information of local vulnerabilities and susceptibilities for use in strategic plans and operations of the division commander's higher headquarters.

Assist in rear area protection to:

Gain the willing, active cooperation of the populace.

Strengthen friendly leaders; weaken enemy leaders.

Support in the Attack

In the attack the PSYOP direct support company uses its propaganda development and dissemination capability to lower enemy morale and efficiency by:

Inducing attitudes of futility and defeatism in the enemy.

Inducing the enemy to defeat/surrender.

Assisting in tactical deception operations to support OPSEC and other measures to confuse the enemy.

Exploiting the psychological effectiveness of US and friendly firepower.

Support During the Exploitation

When the division enters the exploitation phase of the offense, the PSYOP direct support company can:

Provide PSYOP support to subordinate units to facilitate exploitation of targets of opportunity.

Identify and locate new target audiences, identify conditions, pinpoint vulnerabilities, establish new objectives, and obtain pertinent information to guide PSYOP exploitation.

Conduct PSYOP against bypassed and isolated enemy units in rear areas.

The success of the division's pursuit can be magnified by the ability of the PSYOP direct support company to:

Facilitate the occupation of enemy areas by delivering ultimatums and defect/surrender appeals and directions.

Lower enemy morale and efficiency by emphasizing:

Numerous enemy defeats and high casualties.

Lack of civilian support.

Heavy and effective artillery and air bombardment.

Insufficient or inferior enemy supplies and equipment.

Precarious enemy situation.

Inexperienced or unqualified leadership.

Excessive periods of hardship.

Lack of medical supplies and treatment facilities for enemy sick and wounded.

The forcing of enemy minority groups into combat.

The enemy draft into its combat forces of the overaged, underaged, physically unfit, inexperienced, and totally untrained personnel.

Support in the Defense

To support the division commander in the defense, the PSYOP direct support company can utilize printing, loudspeaker, and audiovisual equipment and call in radio, guided by personnel skilled in current intelligence and propaganda development, to:

Support forces delaying an enemy advance by tactical deception operations to support OPSEC.

Support rear area protection operations:

Gain the willing, active support of the population.

Strengthen friendly leaders; weaken enemy leaders.

Breed uncertainty in enemy troops.

Influence enemy strategy and tactics:

Arouse public opinion and foment political and economic pressures against enemy operations and in favor of friendly forces.

Stimulate support of opposition elements to the enemy, particularly those within its territory.

Lower the morale and efficiency of enemy military forces and civilians by encouraging disaffection among religious, ethnic, social, political, economic, and other potentially dissident elements.

Advise on the psychological implications of planned and executed courses of action.

Identify and locate target audiences, identify conditions and pinpoint vulnerabilities, establish new objectives, and obtain pertinent information to guide PSYOP exploitation.

Evaluate enemy PSYOP efforts to identify psychological weaknesses, both friendly and enemy.

Support in the Retrograde

During retrograde operations, PSYOP teams (using heavy printing presses, radio transmitters, appropriately positioned, as well as semimobile equipment, and highly mobile loudspeaker teams) are able to provide uninterrupted support to the division commander.

Support During Delaying Action

In the delay the PSYOP direct support company supports tactical deception operations in support of OPSEC by disseminating information that supports or confirms the tactical operation and its objectives.

Support in the Withdrawal or Retirement

During withdrawal and retirement, the PSYOP direct support company focuses its attention on:

Publicizing civilian support measures.

Exploiting the psychological effects of US and friendly firepower.

Supporting tactical deception operations.

Supporting counterattacks by identifying and locating target audiences, identifying conditions, pinpointing vulnerabilities, establishing new objectives, and obtaining pertinent information to guide exploitation by psychological operations.

PSYOP IN SUPPORT OF JOINT TASK FORCE (JTF) OPERATIONS

A PSYOP battalion under the operational control of the joint task force (JTF) commander is adequate to support a JTF provided the JTF strength is not greater than that of a corps. As a minimum, the following teams are recommended:

AB (Command and Control Battalion)

FA (Propaganda)

FC (Current Intelligence)

FD (Research and Analysis)

GA (Light Printing)

Others may be added if the situation dictates. When the JTF is larger than a corps, an augmented PSYOP battalion or possibly two battalions are required.

THE JTF PSYOP STAFF OFFICER

The greatest efficiency and effectiveness can be gained by having the PSYOP battalion commander serve in the dual role of JTF PSYOP staff officer and PSYOP battalion commander, except when operating with an amphibious JTF. In this case, with the JTF Headquarters operating from aboard ship, the PSYOP battalion executive officer should remain aboard and serve as the JTF PSYOP staff officer. The PSYOP battalion commander could then exercise command and control of his troops while operating with the senior ground force commander.

THE PSYOP STAFF OFFICER AND THE J2/J3 OPERATIONS CENTER

It is also desirable that the JTF PSYOP staff officer function as a part of the J2/J3 Operations Center, regardless of the joint staff section under which he is assigned on the Joint Table of Distribution (JTD). This can serve as a highly effective method of integrating psychological operations into both intelligence and tactical functions and operations.

To serve as the JTF PSYOP staff officer is a full-time job requiring complete concentration on and dedication to psychological operations. Therefore, it is recommended that the officer filling this position not be called upon or tasked to perform duties other than PSYOP. (See USREDCOM Manual 525-4.)

PSYOP IN SUPPORT OF CONSOLIDATION OPERATIONS

Consolidation operations are those operations directed toward populations in either liberated or occupied areas to facilitate military operations and promote maximum cooperation with the liberating or occupying power. They are a responsibility of the theater commander. The theater Army commander is assigned the task of administering and rehabilitating occupied or liberated territory.

The psychological objectives vary with the area, the population, and the mission of the supported civil affairs unit. The primary objectives are to:

- Obtain support for military operations.

- Orient and reeducate the population in accordance with command policies, objectives, and missions.

ORGANIZATION

If the Theater Army Area Command (TAACOM) covers a large area, it may be subdivided for ease of control. Corps commanders conduct consolidation operations in their areas of responsibility with resources provided by the theater Army.

PSYOP units supporting consolidation operations are placed under the operational control of the Civil Affairs command support units. They supplement organic civil affairs elements, such as civil information sections or teams. Special purpose PSYOP units composed of the K-series consolidation teams (shown in table of organization and equipment (TOE 33-500H) are normally assigned the mission of supporting consolidation operations. These teams are organized to:

- Conduct PSYOP through mass media and face-to-face communications.

- Supervise or advise indigenous personnel on the use of PSYOP through local communications media.

- Provide PSYOP support for rear area protection operations and civil defense.

SPECIFIC CONSIDERATIONS

The following factors must be considered in planning and conducting consolidation operations:

Continuity

Psychological operations in liberated and occupied areas are carried out as a unified, continuously evolving program from the time the area is occupied to the time the military occupation ceases. The plans for PSYOP in support of consolidation operations are prepared as early as possible--the overall plan, prior to occupation; subordinate plans, as soon as the tactical situation permits.

Consistency with Postwar Aims

Consolidation operations planning must be consistent with postwar aims. The PSYOP planner must avoid making commitments for short-term gains that may not fit long-term policies.

Relation to the US Information Program

Consolidation operations must be correlated with the US Government's information program and must follow directives guiding that program.

Relation with Friendly Underground

Every effort should be made to obtain the cooperation of friendly governments-in-exile and friendly guerrilla and resistance organizations in order to coordinate all PSYOP programs being implemented. This will help to eliminate counterproductive PSYOP and to achieve common objectives effectively and efficiently.

OPERATIONAL SUPPORT

PSYOP resources are used to transmit information and directives to the population. However, there are fundamental differences affecting consolidation operations in liberated and occupied territories. In liberated areas psychological operations tend to be persuasive whereas in occupied areas they may be arbitrary and directive. The demands of combat and the need for control, however, may require that people in both areas be treated alike.

Liberated Areas

US activities in liberated areas will be governed by the military situation, US policy, and international and interallied agreements. Agreements will normally require that US forces not target the inhabitants of liberated areas with PSYOP beyond the period of time dictated by military need. The agreements may include a proviso that US forces train, advise, and assist the friendly government and its forces. In these circumstances US PSYOP elements will not actively engage in PSYOP directed towards the indigenous population in the friendly territory. US Army PSYOP doctrine, techniques, and procedures will be used as a basis for advising, training, and assisting the friendly government or its forces.

Occupied Areas

In occupied areas PSYOP assist in implementing civilian reeducation and reorientation programs. The process of eradicating unacceptable ideological practices and influences continues throughout the occupation.

PSYOP ASSISTANCE

Whether implemented by US PSYOP elements, the host country government and its forces, or other allies, PSYOP can assist the commander in the following ways:

Establishing Law, Order, and Discipline

Organization of populated areas involves the judicious use of propaganda designed to calm the fears of the populace, prevent aimless panicky movement, and direct their activities into useful channels. PSYOP help to create a state of mind conducive to the establishment of law and order by conditioning the population to willingly accept imposed controls and restrictions. This reduces the number of troops required for population pacification and control.

Securing Lines of Communication

Modern warfare requires force mobility. It is essential to keep main lines of communication open for the flow of military forces, equipment, fuel, and other supplies.

Control of Refugees, Evacuees, and Displaced Persons

Refugees, evacuees, and displaced persons frequently clog military arteries, hindering the movement of combat units and equipment. By publishing and broadcasting information and instructions, PSYOP units assist the area commander in keeping his lines of communication and supply open.

Marshaling Labor

PSYOP units, under civil affairs direction, assist in publicizing labor needs among the civilian population and directing potential workers to appropriate labor offices.

Intelligence

Through close contact with friendly and hostile persons, PSYOP personnel gain information of value to the G2/S2 (to include intelligence and counterintelligence programs) and the PSYOP effort. It is important that PSYOP personnel insure that such information is placed in intelligence channels. PSYOP also develop and disseminate appeals to the population encouraging them to report information on enemy activities.

Rumor Control

Psychological state of inhabitants in a combat zone makes them vulnerable to rumors which may stimulate undesired actions (or inactivity) that may interfere with combat operations. Rumors must be countered with a timely, accurate, and well-managed information program.

ORIENTATION AND REEDUCATION

The second major objective of PSYOP supporting consolidation operations is the orientation and reeducation of the population. Under policy guidance and direction from higher headquarters, PSYOP personnel advise and assist in the preparation of plans, programs, and operations to indoctrinate and reeducate the local population in areas under US and allied control.

The objective of these programs is to develop understanding and favorable attitudes in the local population toward our military forces, gain local support for the military effort, and aid in the accomplishment of all allied aims and objectives.

Orientation and reeducation of the population begins as early as possible and may run concurrently with the combat support mission. These programs are assisted by publicizing activities which benefit the population and by explaining US and allied intentions vis-a-vis the liberated or occupied areas.

In both liberated and occupied areas this involves eradicating doctrines and practices hostile to US objectives and eliminating the influence of individuals and groups identified with hostile doctrine. This continues throughout the period of occupation. One of the major tools of orientation and reeducation is psychological actions.

US PSYOP elements will not activate or implement PSYOP against an indigenous population when US, allied, or host country agreements prohibit such activities.

These actions, intended to influence the actions and attitudes of the target, can be effectively employed in conjunction with propaganda and information programs. Combined, the effectiveness of each is increased. Planned psychological actions properly publicized are more effective than the word alone.

OTHER PSYOP OBJECTIVES IN CONSOLIDATION OPERATIONS

In consolidation operations, there are a number of objectives other than orientation and reeducation that do not involve the dissemination of propaganda:

Search for Media and Personnel

PSYOP personnel may be called upon to assist in locating indigenous communications media, equipment, supplies, and personnel. Equally important is locating key communicators and influence groups within the society.

Dissemination of News

The people of liberated or occupied areas must be kept informed. Credible information transmitted by press, radio, and television is useful for political indoctrination under an orientation and reeducation program. PSYOP elements may assist in this program.

Collect Information

Much information obtained from local people is valuable in evaluating the "temper" and attitudes of the populace. This information will help to determine the nature and content of the consolidation PSYOP program.

Gain Willing Cooperation

Intimidation stemming from the presence of strong military forces may temper hostility and make the populace more responsive to authoritative direction. Positive, well-publicized psychological measures (actions and propaganda) must be taken to transfer intimidation into long-lasting, willing cooperation.

In occupied or liberated areas feelings of inferiority will often be found among minority groups who, because of race, religion, ethnic background, or socioeconomic status, have humbled themselves for a long time. Thus, they may tend to offer little resistance to propaganda. Advantage should be taken of this situation to gain the assistance of this target group.

In an area recently subjected to total war, civilians are generally in a state of shock, weary, and apathetic. This often renders them unable to resist authority, thus easing control through PSYOP.

In a newly liberated or occupied area a normal characteristic of civilians is to depend upon the occupying power because it supplies vital goods and services. For reasons of self-interest, therefore, these people may be willing to assist the propagandist.

Make The Military Situation Known

Knowledge of the favorable military situation of the occupying forces tends to make the civilian population more cooperative. PSYOP can and should be used to exploit this tendency.

Capitalize on Existing Habits

People are accustomed to receiving news and information through specific, well-known, and established sources and media. They more readily believe and follow information and directives received through these sources and media. The consolidation propagandist capitalizes on these existing habits by using familiar sources, media, formats, and style.

OBSTACLES

Some conditions which may hinder consolidation operations are:

Resentment Against Occupying Forces

Antipathy toward occupying forces may cause resistance in the form of disruptive behavior, even rebellion.

Ideological Differences

The consolidation propagandist may find himself dealing with staunch adherents to ideologies hostile to his own. In conquered territory these hostile ideologies may stimulate the formation of resistance groups; in liberated areas, dissident elements may undermine the occupation. To be effective, the propagandist must understand existing ideological differences. Then he must develop his campaign to deal with the realities of the situation.

Military Misconduct

Occupation forces who lack dedication and understanding of their mission often engage in acts that discourage cooperation by the people. To eliminate misconduct and improve understanding of the mission, the individual soldier must be oriented toward attainment of the mission objectives. His actions and attitude must win the favor of the people.

Although PSYOP cannot be directed at US personnel, PSYOP personnel may make commanders aware of specific tension-producing conduct and the reasons for the public attitude.

Devastation and Disruption of Communications

Consolidation operations depend upon communication. When communications are destroyed or disrupted, informing and controlling civilian populations become difficult. Due mainly to the lack of current information on the situation, disrupted communications affect face-to-face communication as well as mechanical forms such as radio and newspaper. PSYOP units with their equipment and expertise may alleviate the problems caused by disrupted facilities and installations.

Enemy Propaganda

Although forced from the area, the enemy may continue to direct propaganda toward the population, holding some members and perhaps gaining new adherents to his cause. PSYOP personnel are a vital force in countering the effects of enemy propaganda. The best program is one that combines propaganda of the word with propaganda of the deed.

Attitudes

The initial consolidation effort is perhaps the most difficult since the attitudes of the population may not be fully known. Understanding these attitudes helps the operator in planning consolidation operations and increases the potential effectiveness of the operations. These attitudes can be uncovered by target analysis. The following attitudes should be examined.

Attitudes toward occupying forces. Liberated populations normally have more friendly attitudes toward the liberating forces than occupied-area populations have for the occupying forces. The propagandist must ascertain the tenor and intensity of the attitudes of the population to deal effectively with them.

Attitudes toward accepting discipline or control. People accustomed to totalitarian methods may respond favorably to authoritarian controls. Those familiar with a democratic way of life may require persuasion rather than discipline.

Attitudes shaped by proximity of the enemy. When enemy forces are located relatively near occupied or liberated areas, the population will fear their possible return and give minimal cooperation to consolidation operations authorities. On the other hand, if the enemy is remote and unlikely to return, both friendly and hostile persons are more likely to cooperate in the consolidation effort.

Attitudes based on enemy propaganda. In liberated and occupied areas the enemy will seek to advance his own ideology through intensive propaganda. The consolidation propagandist must ascertain the source and effectiveness of enemy propaganda so that he can make his own more effective.

Attitudes created by organized resistance groups. When organized resistance groups exist in liberated or occupied areas, their presence and actions against occupying forces greatly influence the population.

PROPAGANDA IN CONSOLIDATION OPERATIONS

The same principles and techniques discussed elsewhere in this manual apply for the conduct of PSYOP in support of consolidation operations. The attitudes and environment of the target audience must be analyzed before a psychological campaign can begin. Themes and messages must be credible and easily understood, and the target audience must be given reasonable courses of action. Many themes can be developed based on the present situation and designed to pursue specific objectives.

News

News is valuable to support consolidation propaganda objectives. Local news of the military occupation and the progress of the war and world news on political, educational, religious, economic, and scientific matters are relevant and are of increasing interest to the population.

Themes in Liberated Areas

In liberated areas consolidation units primarily use themes concerning the aims of the United States and its allies, emphasizing unity.

Themes in Occupied Areas

In occupied areas consolidation operations may stress the theme that the old order has been replaced and that for their own best interest the people should cooperate with the occupying forces.

Entertainment

In either liberated or occupied areas consolidation units can provide entertainment, such as motion pictures, to people lacking such diversion due to the devastation of war. Whether pure entertainment is presented or mixed with messages, any momentary relief from the realities of the situation will aid greatly in obtaining the cooperation of the people and in creating an atmosphere within which progress toward US objectives can be achieved.

PSYOP IN SUPPORT OF REAR AREA SECURITY

The duties of US PSYOP elements in friendly rear areas generally consist of supporting military or politico-military activities in other areas. Except when required for security or to accomplish the military mission, PSYOP will not be aimed at the indigenous population. Under no circumstances will US PSYOP staffs or units undertake any campaigns, programs, or other activities that will infringe upon the sovereignty of the host country over its populace or lessen such ties between the host country and its populace.

The delineated role of PSYOP units in friendly rear areas must be meticulously adhered to. To avoid embarrassing the US Government or jeopardizing the host country's position with its populace, US PSYOP units will strictly adhere to proper channels in implementing requests for advice, training, or assistance.

Chapter Three

3

PSYOP RELATIONSHIP WITH COMMAND AND STAFF FUNCTIONS

Psychological considerations and operations--basic components of all military activities and operations--are command responsibilities. They are factors to be included in the planning and execution of all military activities and operations. In fact, psychological objectives may be more important than physical objectives in some instances. Tactical operations can be conducted for psychological reasons as well as physical objectives.

CONTENTS

	PAGE
Commander	3-2
Staff	3-2

3

COMMANDER

The commander provides PSYOP guidance consistent with policy received from command authority. His command responsibilities include:

Assessing the psychological impact of the military presence, activities, and operations.

Integrating PSYOP with other politico-military activities and operations.

Planning and conducting operations and activities to achieve specific psychological objectives. This must be done even though he does not have PSYOP personnel to assist him.

Supervising, guiding, and directing his staff to insure that:

Essential PSYOP objectives inherent in the unit mission are identified.

Subordinate commanders and staff officers are provided guidance concerning PSYOP objectives and plans.

PSYOP staff responsibilities are assigned.

PSYOP staff personnel are fully integrated into all intelligence and operations staff activities.

All subordinate commanders and staff personnel are alert for PSYOP targets of opportunity and other situations where PSYOP will help to achieve the unit mission.

A PSYOP training program emphasizing the vital responsibilities of the individual soldier in influencing the opinions, attitudes, and behavior of others is integrated with all instruction and training.

PSYOP elements in exercises are encouraged to simulate and distribute friendly and aggressor propaganda.

PSYOP field teams are used in field training exercises (FTXs) so that they may gain valuable field experience.

STAFF

At joint levels, psychological operations are governed by joint publications.

The **Joint Chiefs of Staff** have the responsibility to:

Plan for the conduct of PSYOP.

Furnish PSYOP advice and assistance to allies, and assist other US agencies.

Formulate joint PSYOP doctrine and specific policies for joint PSYOP.

Provide intelligence support for PSYOP.

Coordinate PSYOP matters with civil affairs, public affairs, and other related activities.

Through commanders of unified and specified commands, plan and conduct combined PSYOP with allied governments and international commands.

Assistant Chief of Staff, G5, Civil-Military Operations (CMO) Officer is the principal staff assistant to the commander in all psychological, ideological, political, economic, and social aspects of military operations. He is also responsible for the PSYOP techniques used to support the command objectives. The CMO has the following PSYOP-related functions:

Advises, assists, coordinates, and makes recommendations concerning civil-military operations, to include the psychological aspects of proposed operations.

Responsible for the preparation of the PSYOP Estimate of the Situation. (See appendix D and appendix E, PSYOP Annex/Appendix to the Operations Order.)

Provides technical advice and assists in the development of educational programs for prisoners of war.

Maintains close, continuing relations with other US agencies having PSYOP responsibilities.

Coordinates with all personnel, units, and agencies to assure that the PSYOP effort is integrated and adheres to policy.

Exercises staff supervision over PSYOP units that are attached or under the operational control of the command.

Evaluates enemy PSYOP efforts to identify psychological weaknesses and to measure the effectiveness of friendly propaganda.

Uses the knowledge and expertise of his PSYOP staff officer to achieve psychological objectives.

Coordinates the acquisition of local resources--equipment, material, expendables, and personnel.

Assures that civil affairs and PSYOP units mutually support each other.

For additional details, see FM 101-5 and FM 41-10.

The Psychological Operations Staff Officer works under the G5/S5, CMO officer at corps and below. If there is no G5/S5 in a unit, he works under the G3/S3. Above corps level, PSYOP activities are managed by a separate PSYOP staff officer. At theater headquarters, the PSYOP staff officer has the responsibility to:

Develop theater PSYOP policy.

Develop long-range PSYOP plans.

Advise on the PSYOP implications of planned and executed courses of action.

Prepare and coordinate PSYOP requests and estimates.

Develop plans, orders, and campaigns to support the following activities and operations:

- Combat--conventional and unconventional warfare.

- Foreign internal defense (FID).

- Civil affairs--rear area protection.

- Civil internee and PW programs.

- Any action involving the military presence, activities, or operations.

Evaluate enemy PSYOP efforts to identify PSYOP weaknesses and to measure the effectiveness of friendly propaganda.

Exercise staff supervision to assure execution of the commander's directives.

Assure exploitation of psychological operations opportunities.

Coordinate PSYOP intelligence needs and collect reports (including raw field reports), information, and intelligence from various sources. Some sources are G2/S2 reports; PSYOP personnel in the field; the media--press, radio, TV, etc.; professional politicians and political scientists; cultural anthropologists; sociologists; historians and historical documents; the "man in the street"; battle reports; government, business, social, and labor leaders; soldiers of all ranks; captured and interned enemy military and civilian personnel; refugees; etc.

Furnish the information/intelligence to the G2/S2 to insure integration of the PSYOP and combat efforts.

Use the PSYOP Automated Management Information System (PAMIS). (See chapter 15.)

Coordinate the development, update, and use of basic PSYOP studies (BPS).

Circulate information, area studies, and research papers.

Assist the CMO in preparing PSYOP estimates. (See chapter 15 and appendix D.)

Coordinate the analysis of effectiveness of PSYOP campaigns, themes, messages.

Train, advise, and assist friendly PSYOP personnel.

Coordinate the PSYOP aspects of tactical deception operations.

Psychological Operations Intelligence Personnel should maintain liaison with the G2/S2 office of the supported unit. Liaison with the G2/S2 is vital because PSYOP planners and operational units must have immediate, detailed, PSYOP-relevant intelligence if they are to operate effectively. PSYOP personnel may assist in interrogations, make known the intelligence needs of supporting PSYOP teams, and extract intelligence for PSYOP use.

Chapter Four

METHODS OF EMPLOYMENT

Support responsibilities of PSYOP units are designated by the assignment of missions by the force commander (higher authority) on the recommendation of the PSYOP force commander (the Theater PSYOP Group Commander) and of the ACoS, G5, or G3/S3 if there is no G5/S5. A subordinate PSYOP unit commander has the authority to issue to his subordinate elements orders that are necessary to accomplish his assigned mission. This includes task organization and assignment of missions, provided this does not reduce the degree of control retained by the commander who originally assigned the mission.

Psychological operations units may be assigned general support (GS) or direct support (DS) missions or both. When so employed, the supported unit furnishes common facilities and items (i.e., messing, paper, ammunition, etc.). PSYOP units may also be assigned or attached to military commands.

A cellular organization, which has been augmented from other TOEs, is the most practical for PSYOP units to perform their various support missions, whether they be strategic, tactical, consolidation, or others.

PSYOP MISSION

The PSYOP unit mission may be general or specific. The mission statement is the restated mission determined by the PSYOP commander's mission analysis. **Each mission must be clearly defined and not so broad as to be meaningless.**

The PSYOP unit mission normally is to support a force or other commander or commanders. It is given in orders and instructions from higher authority, or it may be deduced from knowledge of the situation and of the intent of the supported commander.

When paragraph 1 of the Estimate of the Situation gives a PSYOP unit a general mission of supporting a force commander, the commander of the PSYOP unit includes the course of action of the supported command, or commands, if known.

Specific missions should normally be within the general support mission. A specific mission may be contained in orders or instructions from higher authority, normally the force commander being supported, or it might be arrived at from knowledge of the situation and intent of the supported force commander. (See FM 101-5, Sequence of Actions in Making and Executing Decisions and Combat Service Support Commander's Estimate of the Situation.)

CONTROL AND COORDINATION

It is likely that a number of agencies will be engaged in PSYOP within a theater of operations, including those representing countries other than the United States. Unless control of all PSYOP is centralized within one body, under a single command, duplication of effort, contradictory propaganda, propaganda contrary to national policy, and propaganda of more use to the enemy than the United States and its allies will result. The net result will be confusion and ineffectiveness.

No less important is close coordination at all levels, from the highest to the lowest. It is of the utmost importance at the tactical operating levels. For not only may uncoordinated PSYOP activities result in an unnecessary duplication of effort, they may also be contraindicated and, at best, confusing.

STAFF CHANNELS

Employment of PSYOP units may not be standard within a theater of operations due to the situation, which may be different in various areas or zones. There should, however, be a continuous and uniform staff channel from the highest level down to the lowest unit to insure an integrated and coordinated PSYOP effort and to avoid a confusing network of cross-channel communications.

GENERAL SUPPORT (GS)

A PSYOP element in general support supports an entire force and not any specific subordinate unit or subdivision. Units with this mission remain under the control of the PSYOP force commander and provide the force commander with a means to direct the PSYOP effort in his area of influence.

DIRECT SUPPORT (DS)

A PSYOP element assigned a direct support mission provides close, continuous support to a specific maneuver element or other force. A PSYOP unit with a direct support mission remains under the command of the higher PSYOP commander. It responds directly and gives priority to requests of the supported unit. The DS PSYOP unit is responsible for establishing liaison and communication with the supported unit.

ASSIGNED OR ATTACHED

PSYOP units may be assigned or attached to military commands or civil-military agencies. Assigned PSYOP units are under the command, control, and administration of the commander of the unit to which they are assigned. Attached PSYOP units and elements are subject to limitations imposed by the attachment order. The commander of the receiving unit exercises the same degree of control over the attached PSYOP element that he does over units or persons organic to his command. Responsibility for transfer and promotion of personnel, however, is retained by the parent PSYOP unit commander. Attachment is usually maintained for the duration of a mission or task.

CELLULAR ORGANIZATION

PSYOP units, organized under the cellular TOE 33-500 series, are tailored to perform missions that may be given to any command. The use of cellular teams permits balanced units to be formed with minimal personnel and administrative procedures. This type of unit may add or delete teams

without affecting its organic structure or requiring unit redesignation. (See appendix B for team designations, capabilities, basis of allocation, and mobility.)

AUGMENTATION

The TOE 33-500 series provides for augmentation with cellular teams from other TOE for administration, mess, signal, and medical services. The TOE has no provision for PSYOP unit personnel to augment corps or division staffs. The chief or commander of the supporting PSYOP team or unit can, however, fill the dual roles of commander and staff officer.

USE OF LOCAL RESOURCES

Psychological operations units, for practical reasons, make maximum use of local resources. In addition to economic advantages, the use of local resources, when given voluntarily, gives the local population a vested interest in the operation; in effect, it creates a partnership between the target audience and PSYOP units. This adds a degree of authenticity to the operation and contributes to the success of a campaign.

AIRBORNE

In order to be able to perform any PSYOP missions, designated teams are airborne qualified when supporting airborne commands. Their organic equipment can be transported in US Air Force aircraft.

STRATEGIC OPERATIONS

Because strategic operations have long-range military and political objectives and frequently require coordination with other government policymaking agencies and friendly governments, PSYOP units supporting strategic operations generally will receive their instructions from the National Command Authority. Such PSYOP units generally do not operate in the combat zone.

TACTICAL OPERATIONS

Units supporting tactical operations of combat units in combat zones use mobile loudspeakers and audiovisual and printing equipment to achieve immediate and short-term objectives.

CONSOLIDATION OPERATIONS

PSYOP units supporting consolidation operations assist civil affairs commands in orienting and reeducating populations. The primary purposes are to make combat operations easier and quicker by gaining the willing cooperation of the populace.

LIMITS ON PSYOP

The limits imposed on psychological operations depend on several factors, such as the rules of land warfare, US Government policy, treaties and agreements to which the US is a signatory power, types and phases of conflict, the mission, and the availability of the target audience(s). For example, PSYOP elements on a training and advisory assignment in a friendly country, may do no more than train and advise. In addition, they must base their training and advice on US Army doctrine, techniques, and procedures.

ORGANIZATION OF PSYOP UNITS

(See TOE 33-500H, Psychological Operations Organization, for general organization, detailed breakdown of teams, capabilities, basis for allocation, personnel and equipment allowances.)

PSYCHOLOGICAL OPERATIONS COMMAND

When a PSYOP group is assigned to a theater, it is normally task organized to furnish PSYOP support to the theater of operations. Usually, general support battalions are retained to provide PSYOP support to the theater (see figure 4-1).

TYPE PSYOP UNIT ALLOCATION						
UNIT		THEATER	UNIFIED COMMAND	CORPS	SEPARATE DIVISION	TASK FORCE/ SEP BDE
GROUP		1 or more	1			
BATTALION	GS	1 or more	1

	CONSOLIDATION	1				
COMPANY					1	1
						1

FIGURE 4-1

A TYPE THEATER PSYOP SUPPORT ORGANIZATION

GROUP HEADQUARTERS, TEAM AC

Group Headquarters, Team AC, is the highest level and largest PSYOP command and control unit. It consists of a staff and a supply and maintenance element. This group headquarters team commands and controls two to five PSYOP battalions. It also provides limited administrative and logistical support to its subordinate battalions. Team AC, with suitable operational teams, is normally assigned to theater Army or to a unified command when two or more PSYOP battalions are assigned or attached (figure 4-2).

FIGURE 4-2

A TYPE ORGANIZATION PSYOP GROUP

COMMAND ASSESSMENT, TEAM AD

Command Assessment, Team AD, is deployed with a corps deployment package into a hostile area to analyze and evaluate the psychological warfare possibilities, to make recommendations to the ground force commander in the area of psychological operations, and to determine what PSYOP functional teams should be deployed into the area. It is also used to evaluate the results of any psychological campaign that had been conducted prior to insertion and to plan the use of themes to be used in a PSYOP campaign.

The basis of allocation is one per corps deployment package. This team is normally attached to a PSYOP DS battalion. It may, however, be made a part of a PSYOP group should circumstances so dictate (figure 4-2).

BATTALION HEADQUARTERS, TEAM AB (SUPPORT)

Battalion Headquarters, Team AB, with appropriate teams attached, may support all types of military operations. In performing its mission, the PSYOP battalion may be in GS or DS to:

- A major component of a unified command, or a subordinate unified command.
- A separate corps or unit of equivalent size.
- A separate division or equivalent size unit.
- A military police prisoner-of-war (PW) command.
- Others, as needed.

GENERAL SUPPORT (GS) BATTALION

A PSYOP battalion in support of the theater force as a whole consists of an AB team with attached research, intelligence, development, production, radio, and printing elements. A basis for allocation is one or more per theater, as required. A GS battalion normally does not have subordinate companies (figure 4-3).

FIGURE 4-3

TYPE ORGANIZATION PSYOP GENERAL SUPPORT BATTALION

PSYOP DIRECT SUPPORT (DS) BATTALION HEADQUARTERS

A battalion headquarters in support of a tactical force consists of a staff, supply and maintenance, and a research and analysis element. This headquarters can command and control two to five PSYOP companies. It can provide logistical and PSYOP developmental support to subordinate companies. The basis of allocation is one per corps, separate division, or equivalent command.

When a PSYOP battalion is in direct support of a corps, the battalion HHC is retained at corps headquarters to provide general support to the corps. The other companies are placed in direct support of major subordinate headquarters. (See figure 4-4.)

PSYOP PRISONER-OF-WAR (PW) SUPPORT BATTALION

A PSYOP prisoner-of-war command support battalion works under the PW commander. It consists of an AB team with intelligence, research, propaganda development, and printing elements. This unit assists in planning and supervising PW education programs. It also acquires and disseminates intelligence and analyzes data received. The PW support battalion also pretests and post tests propaganda media. The basis of allocation is one per theater. (See figure 4-5.)

PSYOP CONSOLIDATION BATTALION

A PSYOP battalion supporting consolidation operations consists of an AB team and personnel qualified in motion picture, radio, television, printing, and display operations. The basis of allocation is one battalion per theater. (See figure 4-6.)

PSYOP DIRECT SUPPORT COMPANY

A PSYOP direct support company consists of an AA command and control team with supply and maintenance, propaganda, current intelligence, light printing, audiovisual, and loudspeaker teams. The basis of allocation is one per division, separate brigade, task force, or equivalent size command. (See figure 4-7.)

FIGURE 4-4

TYPE ORGANIZATION DIRECT SUPPORT PSYOP BATTALION

FIGURE 4-5

TYPE ORGANIZATION PSYOP PRISONER-OF-WAR SUPPORT BATTALION

FIGURE 4-6

TYPE ORGANIZATION PSYOP CONSOLIDATION BATTALION

FIGURE 4-7

TYPE ORGANIZATION DIRECT SUPPORT COMPANY

PSYOP BATTALION OPERATIONS

MISSION

The mission of the PSYOP battalion is to:

Plan and conduct psychological operations.

Develop, produce, and disseminate propaganda.

Advise as to the psychological impact of planned and executed operations and actions.

In planning, executing, and coordinating the battalion effort, the psychological operations planner must:

Adhere to national policy **for the area of operations.**

Insure that psychological operations and propaganda produced conform to directives from higher headquarters, Department of State, or the ICA.

There is a serious danger that propaganda developed at the lower echelons will not conform to policy from higher headquarters. A commander cannot interject personal or "gut feeling" propaganda that violates policy. **It is the duty of the senior PSYOP officer with the command violating policy to advise against this course of action and to recommend a conforming course.**

Normally, the major tactical headquarters is granted approving authority to initiate PSYOP campaigns and introduce themes. They must, however, conform to the guidelines in the PSYOP section of the plan or order. **Propaganda may be disseminated only in the command area of responsibility.**

CAPABILITIES

The mission of the supported element determines the type, size, and mix of cellular teams that form the battalion. These factors determine the PSYOP unit's capabilities.

Battalion headquarters commands, controls, guides, and coordinates subordinate teams. Each battalion has an AB team. Each company has an AA team. The G5 office and the tactical operations center (TOC) are the points of contact for external coordination.

Intelligence Operations

Current intelligence is received from the G2/S2, the IB (Mobile Radio Monitoring) team, and other intelligence channels. Each battalion has one or more FC (Current Intelligence) and FD (Research and Analysis) teams working under close supervision of the FA (Propaganda) team. These teams process current and background intelligence for the battalion and provide the FA team with the information it needs.

Propaganda Development—Propaganda Development Center (PDC)

The FA, FB (Audio and TV Production), FC, FD, and FE (Graphic Production) teams are generally combined to form a PDC (located near the G5) whose members have routine access to information about current and planned operations.

$$\left. \begin{array}{l} \text{FA} + \text{FB} + \\ \text{FC} + \\ \text{FD} + \text{FE} \end{array} \right\} = \text{PDC}$$

With the information it receives from the FC and FD teams, the FA team develops campaigns, propaganda themes, and messages and determines the media to be used and the amount of propaganda to be disseminated in a given area (density of dissemination).

PDC Guidance and Information. In addition, the PDC guides and informs forward teams by:

Informal staff coordination.

Command visits.

Published orders and plans.

Target Analysis Worksheet. One of the major tools used by the PDC is a Target Analysis Worksheet which is a working summary of all intelligence collected relative to a target audience (see appendix F). The completed worksheet indicates:

The target.

Conditions affecting the target that are important to the psychological operator.

Audience weaknesses (susceptibilities) that can be exploited.

The extent to which the target group can help to accomplish the PSYOP mission.

Campaign Control Sheet. The FA team uses the Target Analysis Worksheet to develop a Campaign Control Sheet (appendix G). This document, in chart form, indicates the concept and execution of a PSYOP campaign. It is used to control a PSYOP campaign.

Production

FA team produces rough copy for all forms of propaganda.

FB team prepares radio, loudspeaker, and television scripts.

G-series teams print copy in final form; e.g., leaflets, posters, handbills, newspapers, magazines, etc.

ID team prepares and produces radio programs.

Spreading the Word

The distribution and dissemination of all propaganda is coordinated with the PSYOP battalion S3. The battalion may make personnel available to assist in aerial delivery of printed propaganda and loudspeaker messages.

HB team makes loudspeaker broadcasts.

HC team makes audiovisual presentations.

IC team transmits radio programs.

GA, GC, and GE teams print, package, and distribute printed propaganda to dissemination points.

PSYOP TEAMS IN THE FORCE REAR AREA

The printing, radio, and television teams are normally located in the rear areas of the major forces they support. The printing teams should be located where paper stocks can be properly stored and readily moved, and the final product can be easily distributed.

The graphics, printing, and audiovisual teams support a command on a mission basis. Work priorities are established by the PSYOP battalion S3 based on the needs of the supported force commander. Based on PDC guidance, scripts, graphics, and printed copy are prepared by local illustrators and writers or others intimately familiar with the target audience.

The Printing Cycle

The PSYOP battalion S3 gives the chief of the press section printing priorities and suspense dates. The organic teams--light GA, medium (mobile) GB and GC, and heavy (fixed) GD and GE--produce camera-ready copy and printed propaganda.

The final product must be approved by the originator of the propaganda request before it can be disseminated to the target audience.

The press team packages the final approved product for the selected method of dissemination and delivers it to the airfield, artillery unit, ammunition supply point, or other distribution point.

Air Support

Requests for aircraft to drop leaflets or make aerial broadcasts are normally made through the G3/S3 Air. The type of aircraft used, whether manned or remotely piloted vehicles (RPV), is determined by the Air Force or Army aviation element delivering the propaganda.

The density and effectiveness of enemy air defenses are major factors in determining whether air support will be available. There may be times when a valid request for air support cannot be met due to the extreme effectiveness of enemy defense measures. Use of aircraft exclusively for PSYOP missions is rarely possible.

Radio and Television

Radio and television programs are broadcast over available local and organic facilities. Qualified local personnel are used as much as possible, particularly scriptwriters, directors, actors, engineers, and stagehands.

FORWARD TACTICAL HB AND HC TEAMS

The HB (Loudspeaker) and HC (Audiovisual) teams normally **support forward tactical combat units**. These teams, which also collect intelligence, need qualified linguists. HB teams broadcast from the ground (mounted and dismounted) and from the air. HC teams present slide and motion picture shows, make loudspeaker broadcasts, and produce small amounts of leaflets.

LANGUAGE-QUALIFIED PERSONNEL

In order to be effective, the battalion must be augmented with a local, professional, language-qualified staff to assure that the final product is:

The best that can be produced.

Appropriate to the target audience.

Relevant to their interests.

Credible and persuasive.

*Chapter Five***5****PSYOP IN SUPPORT OF
FOREIGN INTERNAL DEFENSE**

The primary responsibility for preventing or defeating an insurgency rests with the host country (HC) government--not with the United States or any other assisting government. As a first step, the host government must recognize the existence of an insurgency and fully understand its political nature. Once the HC government understands the cause of the insurgency, it must show interest in the well-being of the people by developing and implementing programs that meet their needs.

ROLE OF THE PSYCHOLOGICAL OPERATOR

The psychological operator has a major role in PSYOP support of FID. He must:

IDENTIFY DESIRABLE PROGRAMS

First, he must identify the objectives of the HC programs, the HC institutions that have a PSYOP impact, and the programs that HC PSYOP can accomplish.

PARTICIPATE IN POLICYMAKING

Then, he must participate in policymaking at all levels of command. In fulfilling this role, he must assure that the greatest possible consideration is given to the psychological aspects of all policies, programs, and operations.

COMMUNICATE

His next role is that of communicating. In HC PSYOP one of his major roles may be to assist in making known and "selling" the positive programs of the government to its major internal targets. Unexplained government programs breed rumors and suspicion. The communicated program promotes public awareness and appreciation of the government's interest in its people.

THE HOST COUNTRY SOLDIER

Host country armed forces personnel must be indoctrinated with the importance of the civilian population in internal defense and development operations. The individual soldier must understand that his actions toward the population may spell the difference between success or failure.

HOST COUNTRY PSYOP SUPPORT

A unified communications organization is needed for FID activities. An established bureaucracy may tend to become isolated and unable to communicate with the public it is supposed to serve. PSYOP must be closely coordinated with the government information services to avoid contradiction in output.

The criteria for selecting PSYOP personnel should be ability and skills rather than military versus civilian status; neither category has a monopoly on imaginative skill or the ability to influence people. The admixture of personnel takes into account the fact that the political and military aspects of insurgency are interwoven. In order to have any chance of success, the guidance and operations of the integrated PSYOP organization must be accepted by all military and civilian sectors of the population.

US SECURITY ASSISTANCE TO HC PSYOP

US Army participation in PSYOP is initiated **on request of the host government and upon approval of the appropriate US Government agencies**. US Army PSYOP elements may be developed and deployed as mobile training teams (MTT), technical assistance teams (TAT) as part of a US security assistance element, or in direct support of US combat units. They may be attached or under operational control (OPCON) to an in-country Joint US Security Assistance Training Group (JUSSATG).

In order to cope with misunderstandings, delayed actions, or inaction brought about by differences in stages of development and sophistication, culture and language, concepts of time, orientation to mission accomplishment, etc., the US psychological operator must have patience. Differences in patterns of behavior, ethics, pace of life, concepts, sense of obligations, loyalties, concern with adherence to rigid time frames and schedules, and so on may lead the US psychological operator to become impatient and try to do the job himself. This effort is generally doomed to failure. When he has failed to do the job himself, the US psychological operator may try to have host country personnel do it all; this, too, will fail.

The US psychological operator cannot insist that HC personnel attempt to communicate with US equipment and techniques as he does (i.e., as American substitutes). The communications that will result will be neither US nor HC but will combine the worst characteristics of both, with equally disastrous results.

US PSYOP forces can best assist the host country with hardware and advice. This subsidiary role of US forces does not lessen the responsibility of the host government to communicate with its own people, using its own tools and techniques, in its own image.

THE HOST COUNTRY SOLDIER

Host country armed forces personnel must be indoctrinated with the importance of the civilian population in internal defense and development operations. The individual soldier must understand that his actions toward the population may spell the difference between success or failure.

HOST COUNTRY PSYOP SUPPORT

A unified communications organization is needed for FID activities. An established bureaucracy may tend to become isolated and unable to communicate with the public it is supposed to serve. PSYOP must be closely coordinated with the government information services to avoid contradiction in output.

The criteria for selecting PSYOP personnel should be ability and skills rather than military versus civilian status; neither category has a monopoly on imaginative skill or the ability to influence people. The admixture of personnel takes into account the fact that the political and military aspects of insurgency are interwoven. In order to have any chance of success, the guidance and operations of the integrated PSYOP organization must be accepted by all military and civilian sectors of the population.

US SECURITY ASSISTANCE TO HC PSYOP

US Army participation in PSYOP is initiated **on request of the host government and upon approval of the appropriate US Government agencies**. US Army PSYOP elements may be developed and deployed as mobile training teams (MTT), technical assistance teams (TAT) as part of a US security assistance element, or in direct support of US combat units. They may be attached or under operational control (OPCON) to an in-country Joint US Security Assistance Training Group (JUSSATG).

In order to cope with misunderstandings, delayed actions, or inaction brought about by differences in stages of development and sophistication, culture and language, concepts of time, orientation to mission accomplishment, etc., the US psychological operator must have patience. Differences in patterns of behavior, ethics, pace of life, concepts, sense of obligations, loyalties, concern with adherence to rigid time frames and schedules, and so on may lead the US psychological operator to become impatient and try to do the job himself. This effort is generally doomed to failure. When he has failed to do the job himself, the US psychological operator may try to have host country personnel do it all; this, too, will fail.

The US psychological operator cannot insist that HC personnel attempt to communicate with US equipment and techniques as he does (i.e., as American substitutes). The communications that will result will be neither US nor HC but will combine the worst characteristics of both, with equally disastrous results.

US PSYOP forces can best assist the host country with hardware and advice. This subsidiary role of US forces does not lessen the responsibility of the host government to communicate with its own people, using its own tools and techniques, in its own image.

Within the context of an insurgency, US PSYOP have five major objectives:

Assist the HC government in gaining the support of its people.

Assist the HC government in defeating the insurgent movement.

Assist the HC government in providing a psychological basis for rehabilitating returnees from the insurgent movement.

Establish and maintain a favorable US image in the HC.

Influence neutral groups and the world community.

Target Audience Considerations

Although the physical situation is important, the social environment of the target is generally more significant. One major consideration is the diversity of target audiences. Each target audience is composed of individuals and groups living under diverse constraints, having diverse interests, levels of education and intelligence, occupations, beliefs, attitudes, and perceptions.

Campaigns, themes, and messages must be designed to influence the various groups within each major audience category; propaganda produced must be based on the culture of each major target group and appeal to the personal sensitivities and interests of that target group.

In an FID situation, the government must convince the populace of its concern. Government activities must reflect government programs that are effective, attractive, and beneficial to the population.

HOST COUNTRY TARGET GROUPS

THE INSURGENT

The major PSYOP objectives are to discredit the insurgents and to isolate them from the population. The insurgents include the guerrillas and their supporting elements--the auxiliary and the underground. The insurgent's infrastructure is invisible. This gives the insurgent an advantage over the government as any damage done to the government is highly visible and has an immediate effect.

An insurgency is determined and gains morale and physical strength in direct proportion to its effectiveness and the attractiveness of its ideology. The cadre and highly motivated members may not be vulnerable to propaganda. Below them, however, there are usually a number of vulnerable individuals and groups; these, though tightly controlled, can be propagandized effectively. The most important direction of attack is against insurgent unit morale.

The insurgent must be destroyed physically and psychologically. Psychological destruction is extremely important because without it, the insurgent force may simply disappear underground to surface at a more opportune time.

Programs should publicize and exploit differences between cadre, recruits, supporters, and the local population. Other themes might emphasize lack of support, isolation, homesickness, or hardship suffered by the guerrillas.

THE POPULATION

Since popular support of the people is essential to victory, the population is the major psychological target of the insurgent and the government. The people are the source of intelligence, manpower, and logistical support for the insurgents.

The major PSYOP mission is to build national morale, unity, and confidence in the government, its leaders, and programs. There should also be an effort to win popular acceptance of the presence of US Armed Forces and to convince the people that:

Government programs serve the interests of the people.

The government forces will protect the people and defeat the insurgent.

Ultimate victory is assured. This need to stress ultimate victory is paramount because if the insurgency enters the second stage, the people's immediate concern will be survival, and they will support the apparent victor.

Voluntary reporting of antigovernment activities is in their best interests.

The insurgent is being misled by questionable promises of a foreign power and is the lackey of that foreign power.

Identification of insurgent leadership will shorten the life of the insurgency and hasten return to a way of life that fulfills the perceived needs of the people.

The people have a major active role in essential counterintelligence activities.

GOVERNMENT PERSONNEL

Host country government personnel are a major internal target. The military, paramilitary, civil services, and other elements of the government make excellent target audiences because:

They have a vested interest in having the government remain in control.

The established chain-of-command or organizational structure facilitates communications and local response.

The PSYOP mission in dealing with this target group is to maintain loyalties and develop policies and attitudes which will result in members of the group:

Realizing the importance of the population and the necessity for popular support.

Promoting the public welfare and justice.

Taking actions within their sphere of activity that will eliminate the basic causes of the insurgency.

Protecting the population from the insurgent.

NEUTRAL AND NONHOSTILE ELEMENTS OF THE POPULATION

The emphasis in communication to the friendly or uncommitted population should be positive and constructive. PSYOP efforts should publicize the tangible and visible accomplishments of the legitimate government. Part of the communication effort should discourage public apathy and activity that will help the insurgent.

The population should not be asked to undertake any action that is contrary to its own direct interest. The most obvious example is action which leads to physical jeopardy or death. If the population takes such action, not realizing the consequences, and the outcome is harmful, the authority that sponsored the communication will lose credibility and its audience.

POPULATION COMMITTED TO SUPPORT THE INSURGENT

The audience supporting the insurgent may do so either out of conviction or involuntary involvement. The PSYOP mission in this case is to achieve a withdrawal of support for the hostile effort and defection in place or in person to the host government. A surrender or return program is recommended as the core effort toward this target.

FOREIGN AUDIENCES

Foreign audiences range widely, geographically, politically, and in their relationships with and attitudes toward the legitimate government and the insurgents. For neutral nations, the purpose of PSYOP is to achieve a friendly neutrality or active support. For external hostile powers, the major objective of PSYOP is to influence public opinion within such nations. An active minority within such nations can change the course of national policy and action. Plausible communications are needed to influence foreign audiences.

Communications to foreign audiences can have a favorable effect on domestic audiences, particularly urban intellectuals and mass media communicators who may be influenced by the foreign reaction.

INSURGENT PROPAGANDA OBJECTIVES AND ORGANIZATION

The insurgent has recognizable psychological objectives, methods, and organization. His themes appear rational and, therefore, are difficult to neutralize or discredit.

THEMES

Insurgent themes typically stress government weaknesses and the gap between government programs and policies and the perceived needs of the people. The primary theme stresses the idea that the objectives of the insurgent coincide with the needs and aspirations of the people. They try to convince the people that the interests of the populace are not served by the government. Themes about government corruption, nepotism, scandal, and other corruptive factors are used to convince the people that their government is unfit to lead them. Other themes used are anticolonialism, nationalism, and land reform.

Insurgent leaders try to make everyone a propagandist. However, the driving force is the hard core cadre.

THE INSURGENT ORGANIZATION

A major technique of expanding control is by means of a vertical shadow political organization--a shadow government. The primary function of the vertical organization is to insure centralized and responsive direction of the insurgent component, either covertly or openly, as circumstances permit. In an insurgent-controlled area, the organization is headed by the local party secretary. The other local personnel report to him.

At the same time, horizontal organizations act as propaganda agencies. These agencies stress the use of face-to-face PSYOP. All other types and media of propaganda are also aggressively used--propaganda of the deed, radio, TV, leaflets, and rumor.

The horizontal organizations organize the populace into functional and "window dressing" groups that meet the needs of the insurgent leaders to control the population through organized groups and that meet the needs of the people to participate. These groups, because they appear and allege to be independent and acting on their own, are extremely deceptive. Individuals within these groups (farmers, women, students, young people, etc.) are closely supervised and criticized. Through such organizations, the insurgents cultivate, indoctrinate, recruit, and manipulate a variety of social groups under their control and through them bring in new adherents. Gradually, these organizations take over all social, political, economic, cultural, public safety, and military institutions.

PSYOP TRAINING, ADVISORY, AND ASSISTANCE EFFORTS

The major security assistance role of US military personnel may be to train, advise, and assist a requesting government threatened with insurgency. In this capacity PSYOP personnel/units would have the missions to:

- Improve the ability of the HC to conduct PSYOP in support of its own internal defense and development program.

- Improve HC command and staff understanding of the PSYOP role in internal defense and development and implementation of PSYOP in HC internal defense and development operations and related programs.

- Recommend and provide, when not otherwise obtainable, essential materiel which can be used and maintained by the host country.

These missions may require US PSYOP personnel to train, advise, and assist:

- Host country armed forces.

- Host country paramilitary and public safety forces.

- Other elements and agencies of the HC government.

- The US military mission within the host country.

An organization should be structured to perform these unique multiple missions. As a minimum, it should contain these elements:

A headquarters element (company, battalion, group). In a small country, a command and control team should be sufficient.

Training elements, such as detachments, teams, or individuals.

Local augmentation, such as:

Professionals and technicians.

Interpreters and translators.

Secretarial and clerical personnel.

Service personnel.

US military personnel providing security assistance do not conduct psychological operations in a host country. The Joint US Security Assistance Training Group (JUSSATG)--the senior US military headquarters--and subordinate advisory units and activities should give active advisory attention to PSYOP and alert HC counterparts to the psychological impact of all military actions, operations, and individual acts of the HC armed forces.

In order to centralize control, the commander of the US PSYOP unit within the HC may be designated as the US command PSYOP staff officer, or he may provide a representative who can support the G5/J7 staff (CMO) mission in accordance with FM 101-5. The duties of this officer should include those of preparing annual PSYOP training, advisory, and assistance plans.

Budgetary restraints will limit the extent of PSYOP training, number of persons receiving training, and training areas. Monetary restrictions will also set limits on fulfillment of PSYOP equipment needs and procurement sources; i.e., in-country, CONUS, offshore.

Chapter Six

PSYOP IN SUPPORT OF UNCONVENTIONAL WARFARE

Unconventional warfare (UW) involves a broad spectrum of military and paramilitary operations conducted in enemy-held, enemy-denied, or politically sensitive territory. It includes, but is not limited to, the interrelated fields of guerrilla warfare, evasion and escape, subversion, special operations, and other low-visibility covert or clandestine operations. These interrelated aspects of unconventional warfare may be prosecuted singly or collectively by predominantly indigenous personnel.

US unconventional warfare forces, augmented by psychological operations personnel, may support and direct the indigenous personnel effort during all conditions of war or peace.

ROLE OF PSYOP

US UW forces operating within the UW environment have a thorough knowledge of the national and regional social, economic, political, and cultural characteristics of the populace. They have a working ability in the language, communication patterns, and psychological sensitivities of the local populace. The US Army PSYOP element deployed by the US command assists US UW forces in meeting PSYOP requirements.

During UW operations, psychological operations are used to strengthen a weak cause and to make a strong cause even stronger so that its followers, by word and deed, become its dedicated propagandists. More specifically, PSYOP can create unity, maintain or boost morale, renew the resistance force's determination, and develop sympathy for the resistance among uncommitted segments of the population.

PASSIVE ROLE

The mere presence of US UW forces--their operations, official activities, and individual conduct--has a psychological impact on indigenous military and paramilitary forces and the civil population. Official activities and individual conduct in particular help to offset possible unfavorable attitudes of neutrals and uncommitted segments of the population.

US Army PSYOP personnel advise and assist UW forces in developing a favorable image, an image that will win the support of the neutrals, the uncommitted segments, and the resistance movement, its underground and auxiliary forces.

ACTIVE ROLE

With the backing of the United States and its allies, PSYOP policy guidance is directed by the US Ambassador, by the theater military commander, or by a higher level official. These policies, in conjunction with those of local leaders or a government-in-exile, are issued in the form of joint directives. These directives give the authenticity and momentum required to implement an active PSYOP campaign. Within these directives, US PSYOP personnel can actively support UW forces by:

Publicizing successful ambushes and raids, sniper campaigns, interdiction operations, and civil assistance such as sharing medical services and supplies and giving sanctuary to civilian supporters of the resistance.

Publicizing that UW forces are providing manpower and skills to assist the populace in repairing or building needed structures, harvesting crops, maintaining schools and places of worship, and organizing social activity groups. Only structures and activities that the civil population can and will maintain should be assisted. In addition, it is preferred that the idea for a project or other activity and the major input of labor therefore come from the local people.

Warning the civilian population of impending aircraft or missile attacks. These warnings give the impression that the guerrillas control the operation and strengthen the belief of the population in the might of the guerrilla force.

Encouraging some or all of the civilian population, as appropriate, to resist laws, regulations, and restrictions imposed by enemy authorities.

Organizing support elements in all target groups by conducting and supporting intensive education and indoctrination programs.

Meeting face-to-face with local civilians when a specific objective cannot otherwise be fulfilled. These meetings give tangible evidence of US support and appreciation of the objectives and problems of the local guerrilla force. The impact can be strengthened during all stages of UW organization and development.

Assisting in the development and perpetuation of front groups within the populace.

It is crucial that supporting PSYOP personnel have a thorough knowledge of the UW commander's operations environment. Successful employment of psychological operations will win the assistance of supporting resistance elements and build a viable organization.

PSYOP SUPPORT IN UW

PSYOP personnel will plan the type of campaign, themes, messages, media, and methods employed based on an analysis of the target audience. These plans must be integrated in the seven phases of guerrilla warfare--from the psychological preparation stage through the linkup with conventional forces to demobilization. (See PSYOP in the Seven Phases of Development of US-Sponsored Resistance Forces, page 6-6).

PSYOP ASSETS

Theater Command. US Army PSYOP facilities, external to the UWOA, are set up in the theater communications zone by US Army PSYOP units.

Theater UW Command. To support the seven phases of guerrilla warfare, the theater commander attaches a portion of the theater PSYOP resources to the theater UW command. The UW command headquarters coordinates with and supervises US PSYOP support within the UWOA, and coordinates this support with the unified command. Requests for additional PSYOP support are submitted to the unified commander.

Joint Unconventional Warfare Task Force (JUWTF). During hostilities, a psychological operations staff officer from theater headquarters should coordinate with the JUWTF to assist US UW detachments in their respective areas of operations.

Special Forces Operational Base (SFOB). Detachments receive appropriate PSYOP guidance prior to infiltration and are prepared to advise the SFOB commander on psychological opportunities as they arise, to train selected resistance members to apply PSYOP, and, if required, to initiate PSYOP campaigns in coordination with the JUWTF. If additional PSYOP support is required to accomplish tasks beyond the capabilities of the supporting PSYOP element, the SFOB must initiate the request.

Initial PSYOP facilities within the unconventional warfare operations area (UWOA) are austere. Reliance is based primarily on face-to-face communication, but printed media can be produced in enemy-controlled areas by auxiliaries and the underground if indigenous facilities exist. Radio and television coverage may be achieved in the UWOA by transmissions originating from adjacent secure areas.

In later phases, additional PSYOP facilities may be placed in secure areas within the UWOA.

PSYOP TECHNIQUES IN SUPPORT OF UW

Psychological operations techniques such as intelligence collection, target analysis, media selection, propaganda development, and feedback are generally applicable in a conventional or unconventional warfare environment. The task of the psychological operations personnel supporting the UWOA is to employ imaginatively and decisively these techniques in an unconventional warfare environment. To assist in this transition, the PSYOP personnel must be aware of those UW perspectives which differ significantly from conventional PSYOP techniques of employment (See chapter 3, (C) FM 31-20.)

INTELLIGENCE FOR PSYOP

Intelligence is the lifeblood of successful PSYOP. Without intelligence about the feelings and persuasions of the UW target audience, a PSYOP campaign is not likely to succeed. (See chapter 14.) UW forces, by virtue of their mission, deployment, training, and contacts, are able to gather intelligence relevant to the attitudes, allegiance, activities, vulnerabilities, and susceptibilities of the local population, guerrillas, underground, and auxiliary.

MAJOR TARGET AUDIENCES

Using the information supplied by UW forces and other intelligence agencies, four major target audiences may be identified (see pp. 196-198, section V, chapter 3, (C) FM 31-20, and pp. 5-6 to 5-7, chapter 5, this manual):

The Uncommitted

In the initial stage of hostilities, the general population may be neutral or may actively oppose the resistance effort because of fear or uncertainty about the aims of the movement and its success. PSYOP support, therefore, must stress that the resistance shares the political and social goals of the population; that the United States and its allies, in supporting the guerrilla (the military arm of the resistance), support these same goals; and that the resistance movement will be successful.

Enemy Sympathizers

Enemy sympathizers include those civilians in an operational area who are:

Willing enemy collaborators.

Unwilling enemy collaborators--those who collaborate under duress.

Passive enemy sympathizers.

A PSYOP campaign aimed at this target instills doubt and fear. It may be conducted in conjunction with positive political action programs--programs which identify and discredit the enemy collaborator or weaken his belief in the strength and power of the enemy military forces.

It must be noted that punitive action against such collaborators may result in enemy reprisals and, consequently, in a loss of broad civilian support for PSYOP objectives. However, overreaction by the enemy can, when skillfully exploited, build popular support for the guerrilla cause.

Enemy Military Forces

Enemy military forces may be of the same nationality as the population, or they may represent an occupying power or one assisting the enemy government.

PSYOP campaigns are directed against these groups to make their members:

Feel isolated.

Improperly supported.

Doubtful of the outcome of the struggle.

Distrustful of each other.

Doubtful of the morality of their cause.

By focusing on the enemy soldier's frustrations, PSYOP can lower his morale, reduce his effectiveness, and create feelings of inadequacy, insecurity, and fear, increasing his susceptibility to PSYOP and making him more vulnerable to persuasion to surrender, malingering, show disaffection, or desert.

Resistance Sympathizers

Resistance sympathizers include those civilians who are sympathetic to the goals of the movement but who are not active members of some element of the resistance force.

Psychological operations campaigns directed at this target audience stress appeals for the populace to actively (though generally covertly) support or passively cooperate with the resistance forces in achieving common objectives. Inherent in these appeals is a rigid personal code of conduct by resistance members which insures that the people, their sensitivities, culture, customs, and needs are strictly respected.

The words and deeds of the resistance must assure the people that the movement can always be counted on to help protect them from all enemies, and that it is the instrument of political, social, and economic progress--as visualized by the populace.

PSYOP IN THE SEVEN PHASES OF DEVELOPMENT OF US-SPONSORED RESISTANCE FORCES

PHASES	CHARACTERISTICS	PSYOP ACTIVITIES
I-Psychological Preparation	Inhabitants of the area are prepared psychologically to receive US forces.	A PSYOP campaign is planned and executed to prepare the inhabitants of the proposed operational area(s) for the presence of US UW forces. The campaign is planned at the highest levels of a government preparing to support a resistance movement. Citizens-in-exile; other popular, respected, and influential people; and key in-country sympathizers are used. US PSYOP units, under the guidance and supervision of the force/theater commander, have a major role in the campaign.
II-Initial	US nonmilitary agencies in coordination with the allied government-in-exile have verified that the populace is willing to accept sponsorship for their resistance efforts. Initial contact has been made with the resistance force (RF) whose leader requested assistance and sponsorship. The Special Forces Operational Base (SFOB) has been established and is fully operational. Operational elements are in isolation receiving extensive briefings and conducting studies.	The emphasis of the PSYOP campaign is changed to support planned RF operations. The SF Group S5, with supporting PSYOP elements, is responsible for preparing the PSYOP plan. The S5 must: - With SFOB commanders and indigenous assets which have exfiltrated to accompany US UW elements, develop PSYOP campaigns for areas of operations. - Conduct PSYOP orientation and training on target groups, communications characteristics and dynamics, themes, symbols, messages, propaganda production, use of media, and dissemination. - Provide US personnel with an understanding and appreciation of the mutual relationship and interdependence of US and resistance forces. - Develop themes, symbols, and PSYOP actions to support each phase of operations from infiltration to demobilization. - Brief all operational elements on propaganda to be disseminated and PSYOP actions to be conducted in each area of operations. - Coordinate with area specialist teams (ASTs) on PSYOP plans for each operational area.

PHASES	CHARACTERISTICS	PSYOP ACTIVITIES
III-Infiltration	Operational elements have been briefed on PSYOP. Infiltration is complete and contact has been established with resistance leaders.	PSYOP is conducted in support of US UW forces/resistance force contact and development. The area assessment and a PSYOP program through face-to-face communications are initiated. Operational elements establish rapport, having been advised and briefed by the S5 and supporting PSYOP personnel prior to infiltration. Propaganda is supported by tangible evidence of sponsor support in the form of weapons, ammunition, medical supplies, and money provided to resistance leaders. PSYOP themes stress: - The ultimate success of the resistance movement. - The need for mutual support, confidence, and working rapport.
IV-Organization	The operational element has succeeded in establishing rapport with resistance leaders. Tangible proof (money, weapons, medical supplies, etc.) and supporting propaganda have convinced the resistance force that with mutual support, confidence, and working rapport, fundamental goals and objectives can be achieved. Area and guerrilla organization is developed and training begins. Small-scale combat operations may be conducted. The requirement exists for the operational elements to implement unity programs.	The PSYOP effort is expanded to assist in increasing and developing the resistance force. A major objective of the PSYOP program is to insure close cooperation between all resistance elements. Resistance leaders participate in the formulation of PSYOP objectives and are persuaded NOT to take any action which contradicts or interferes with the accomplishment of these objectives. Motivational campaigns targeting the guerrilla forces are initiated. They cover: - History of the country. - History of the enemy and his objectives. - The significance of and need for proper personal conduct of the resistance force toward the civilian population. PSYOP indoctrination programs will cover: - Political, economic, and social objectives of the resistance movement. - Ideological indoctrination of the resistance cadre. - The practical impact of tactical operations on the population.
V-Buildup	Small-scale combat operations increase local support and attract recruits for the resistance force. Operational elements increase their activities to establish rapport, to promote cooperation and unified action, to provide tangible proof of support, and to motivate the resistance force.	PSYOP campaigns (propaganda and actions) are conducted to support the expansion and full development of the resistance force. PSYOP must: - Encourage young people to join the resistance elements. - Encourage and win general civilian support for the resistance movement.

PHASES	CHARACTERISTICS	PSYOP ACTIVITIES
V (cont)- Buildup		Themes, directed to the resistance force, emphasize the rules of engagement. The rules should call special attention to targets whose destruction would impact adversely on the civilian population. The PYSOP campaign continues to stress and assure the success of the resistance force and allied operations. PSYOP must impress resistance leaders that producing favorable reactions among the populace is vital. (This PSYOP program must strongly impress upon them the need to indoctrinate their followers with the need for proper individual and official conduct toward the population. It must also point out the need for stringent disciplinary action against offenders.)
VI Combat Employment	Successful small-scale combat operations have attracted many recruits. The resistance force is now fully developed and full combat operations planned. Due to enemy propaganda, disruption of daily life, and destruction of property, many members of the populace do not understand the reasons for the resistance force's operations. The enemy is actively engaged in reprisals and counter guerrilla operations.* This phase continues until linkup with conventional forces or until cessation of hostilities.	PSYOP must support and exploit the combat capability of the resistance forces. Current propaganda efforts continue. Themes and symbols are directed at various target audiences. Resistance Movement: Assurance of resistance force success over the enemy is stressed. Emphasis is placed on the inevitability of complete victory. Populace: The major themes are nationalism and the support of the resistance movement. Guerrilla Forces: Motivational and indoctrination campaigns are increased. Emphasis is placed on the ability of the guerrilla forces to defeat the enemy; the enemy's frustration in counter guerrilla operations is exploited. Enemy Forces: The inevitability of the enemy's death and defeat by the resistance force is emphasized. The fact that the enemy is not safe in any area is stressed.
VII Linkup and Demobilization	Conventional forces have moved into range of designated UWOAs and linkup operations are imminent. Liaison parties (which include PSYOP personnel) from the SFOB have been attached to the conventional force headquarters with plans for PSYOP to support the linkup and demobilization of the resistance force. SFOB prepares and coordinates plans with the conventional tactical ground commander. Because of its extreme sensitivity and importance, plans for demobilization must begin in the early phases of operations and be continuous. When the resistance force is no longer needed, higher headquarters will order its disposition, to include demobilization. The practical problems of nationalization, i.e., political, economic, social, ethnic, racial, religious, and military, are surfaced.	PSYOP propaganda and actions (campaigns) support the linkup and the subsequent demobilization. Linkup: Information is widely distributed in the UWOA to prepare the populace to cooperate fully with the conventional tactical forces. The public is urged to remain in place in order not to hinder operations that will bring hostilities to a successful end. Resistance leaders are briefed on the importance of close cooperation with tactical force commanders. The resistance force is psychologically prepared to be incorporated into the national army or to be demobilized. Resistance leaders and guerrilla force commanders are psychologically prepared to accept new leadership from the conventional force on linkup. Troop commanders and staff officers inform the troops of the importance of proper individual and unit conduct. Demobilization: A PSYOP campaign is implemented to explain the demobilization process. The campaign provides for the orderly transition of the resistance force to peaceful civilians, preventing the formation of quasi-military or political groups in conflict with the objectives and policies of the recognized government. Loyalty to the post-hostilities government is stressed.

*NOTE: PSYOP are offensive; they are not defensively reactive to enemy reprisals or actions designed to discredit the resistance force.

Chapter Seven

7

PSYOP IN SUPPORT OF SPECIAL OPERATIONS

COVERT OPERATIONS

Covert PSYOP are normally not a function of US military PSYOP elements due to their political sensitivity, extensive required compartmentation, and normal execution as a component of higher level special operations and planning. Covert PSYOP require exceptional coordination, integration, and direction. They do not disclose their source. The operations are planned and conducted in such a manner that the responsible agency or government is not evident, and if uncovered, the sponsor can plausibly disclaim any involvement.

To achieve maximum impact and to preclude compromise of the overt PSYOP effort, covert and overt operations should be totally separate operations. Personnel engaged in one type of operation must not be engaged in or exposed to the other. Black and gray propaganda are employed in cover operations. (Black, gray, and white do not refer to anything inherent in the content of the propaganda itself, but indicate methods used to carry out an operation.)

CONTENTS

	PAGE
Covert Operations.....	7-1
Black Propaganda	7-2
Gray Propaganda	7-3
Covert Radio Operations	7-3
Tactical Deception	7-3

7

BLACK PROPAGANDA

Propaganda which purports to emanate from a source other than the true one is known as black propaganda.

Black propaganda is best used to support strategic plans.

Advantages

Black propaganda may originate within or near the enemy homeland, or enemy-held territory, and may provide immediate propaganda messages for a specific audience.

The presumption of emanating from within an enemy country lends credibility to black propaganda and helps to demoralize the enemy by suggesting that there are dissident and disloyal elements within his ranks.

Through the skillful use of terminology, format, and media, messages appear to be a part of the enemy's own propaganda effort, making the enemy appear to contradict himself, and forcing him to mount an expensive, difficult, and exploitable counterpropaganda campaign that highlights the original black propaganda message.

The covert nature of black propaganda and the difficulty of identifying the true source also hinder the enemy's counterpropaganda efforts.

Disadvantages

Stringent and compartmented precautions are required to keep the true identity of the source hidden.

As covert PSYOP seldom use regular communications channels and must copy enemy characteristics, they are difficult to coordinate with the overall PSYOP effort.

Covert operations may be difficult to control because covert PSYOP operating agencies are decentralized.

Stringent security requirements and long-term campaign plans limit flexibility.

These operations are extremely vulnerable to discovery, manipulation, and elimination (of equipment and personnel) when operating within enemy territory.

These operations normally require special personnel, procedures, and equipment available from US agencies outside the US Army.

GRAY PROPAGANDA

Propaganda which does not identify with and cannot be identified with a source is known as gray propaganda.

Advantages

Skillfully used, gray propaganda can:

- Gain acceptance by avoiding the stigma of being "propaganda."

- Use unusual themes without reflecting on the prestige of the originator.

- Introduce new themes based on assumed vulnerabilities without identifying the true source. It can, therefore, be used for "trial balloon" purposes.

Disadvantages

- It is limited by the difficulty of keeping its origin unknown yet authoritative.

- It may be vulnerable to critical analysis, thereby losing effectiveness and making it highly susceptible to counterpropaganda.

COVERT RADIO OPERATIONS

Clandestine radio is a major medium for dissemination of black and gray propaganda. The radio transmitter is normally operated by indigenous personnel of the target country or by third country nationals. As US military personnel may have an advisory role in covert radio operations, they should be aware of the inherent vulnerabilities of this medium:

- All radio communications are susceptible to detection, identification, and location by enemy direction-finding equipment. Consequently, when operating in enemy territory, the operation must be flexible enough to allow displacement of the transmitter.

- Mobile transmitters are normally low-powered and so must be near the target audiences, or a higher powered conspicuous antenna system may be required. In addition, their power source, whether AC or DC must be maintained.

TACTICAL DECEPTION

Psychological operations have a major role in supporting tactical deception operations, which essentially are unique psychological operations. The basic targets of tactical deception operations are commanders and their staffs, whose perceptions and subsequent actions will determine the success or failure of these operations.

PSYOP support tactical deception operations by disseminating information that supports or confirms the deception story and its objectives. In order to lend effective support, it is essential that PSYOP personnel coordinate at all levels of command in the planning and execution of these operations, primarily with the G5, G2, G3, and commanders.

Propaganda supporting tactical deception operations is disseminated by a mix of all available and appropriate media and means. Support is rendered by employing tactics, techniques, and procedures that mislead the targets. For example, in night operations this can take the form of using loudspeaker teams to mislead or confuse the enemy by producing sound effects simulating battlefield noises and movements. PSYOP units can publish leaflets, pamphlets, posters, and newspaper items, and use a mix of all other media and means, including interpersonal communications and rumor, that will assist in achieving tactical deception objectives.

The national unit aspect of tactical deception operations can be assisted by judicious use of PSYOP media.

Chapter Eight

PSYOP IN SUPPORT OF PRISONER-OF-WAR AND CIVILIAN INTERNEE PROGRAMS

8

RESPONSIBILITIES

In accordance with US policy and international law, care and custody of prisoners of war (PW) and civilian internees are command responsibilities. The Staff Judge Advocate is responsible for providing guidance and staff assistance concerning the application of treaties and the law of war. The Provost Marshal at each level of command is responsible for the development of policies, plans, and procedures. The PW camp commander is responsible for all activities conducted within the PW camp.

The degree of PSYOP support required in the conduct of PW activities may be minimal or more extensive, dependent upon DA policy and other factors attendant on a specific conflict and PW attitudes in a given camp.

PSYCHOLOGICAL OPERATIONS

The general objectives of PSYOP in support of PW and civilian internee programs include:

Conditioning individuals to accept camp authority and regulations during internment. The resultant smooth operation of the camp:

Supports the basic custodial mission of the camp.

Minimizes diversion of combat troops for guard duty.

Minimizes disruption of operations by activist pro-enemy prisoners.

Provides a useful basis for surrender appeals to enemy troops.

Denies the enemy opportunity to make unfavorable propaganda claims of US mistreatment of prisoners-of-war and internees arising out of incidents resulting from suppression of PW disturbances.

Supports US policy of encouraging the enemy to treat US prisoners well (at least according to the Geneva Conventions).

Persuading individual PWs or internees to understand and accept US goals. Achievement of this objective may lead the PW or internee, in accordance with US policy and international law, to:

Assist the in-camp PSYOP program.

Aid PSYOP aimed at other populations.

Contribute to the maintenance of order and discipline within the camp, and nullify hostile activity by pro-enemy activities.

Become, after repatriation, a supportive element of US objectives.

OPERATIONS

PSYOP personnel should work with interrogation teams. When applicable, interrogation personnel assigned to PSYOP FC (Current Intelligence) teams may be used to conduct interrogations and gather intelligence needed for media and operations. Timely intelligence for PSYOP use should be obtained as soon as possible after capture of prisoners of war. Prisoners of war, internees, defectors, and line crossers are representatives of broader target groups. They are, therefore, sources of intelligence for target research and analysis and can be used to pretest PSYOP material.

PRISONERS OF WAR

International law determines who will be given prisoner-of-war status. This category (PW) does not include all hostile personnel detained by US forces, but it does include many kinds of personnel other than members of the regular armed forces. A detailed definition is given in AR 633-50.

Treatment of prisoners of war is governed by the Geneva Convention Relative to the Treatment of Prisoners of War of August 12, 1949 (GPW). The GPW is a matter of international law. It is a treaty to which the US is a party, and, as such, it is a part of US law binding on the US Armed Forces.

Certain provisions of the GPW directly affect psychological operations by setting limits for permissible treatment. Pertinent articles are quoted below:

Article 7: Prisoners of war may in no circumstances renounce in part or entirety the rights secured to them by the present Convention.

Article 13: Prisoners of war must at all times be humanely treated... Likewise, prisoners of war must at all times be protected, particularly against acts of violence or intimidation and against insults and public curiosity.

Article 14: Prisoners of war are entitled, in all circumstances, to respect for their persons and their honor.

Article 38: The detaining power shall encourage the practice of intellectual, educational, and recreational pursuits.

Beside observing the prohibitions of GPW, PSYOP should exploit compliance with the requirements and proscriptions of GPW for specific kinds of treatment, including, but not limited to:

Healthful living quarters (Art 25, 29).

Clean messes and adequate rations (Art 26).

PW clothing suitable to the climate; that is, clean and in good repair (Art 27).

Camp canteens where PW may secure foodstuffs, soap, tobacco, and ordinary articles of daily use (Art 28).

Medical facilities and medical care (Art 30, 31).

Freedom of religious observance (Art 34).

Gainful employment of PW in suitable working environments at work having no military character or purpose (Art 50, 51).

Pay for work performed (Art 62).

For further information concerning handling of prisoners of war, consult Standardized National Agreements (STANAGs) 2033, 2044, and 2084.

POLICY AND PLANNING CONSIDERATIONS

Specific policy guidance governing the establishment, objectives, and conduct of PW and internee PSYOP programs is contained in Department of the Army directives published with the outbreak of hostilities. Appropriate guidance is forwarded through command channels to the PSYOP unit committed to the program and to the camp commander for implementation.

Prisoners of war, particularly after extended internment, constitute a highly volatile and sensitive security problem of a nature which is completely unique to PW camps. All PW doctrines and camp activities must therefore be evaluated critically in the light of this problem.

Procedures and programs which have been generally successful may have unexpected and undesirable results if applied without appropriate adjustment to special circumstances and individual target audiences.

GUIDANCE TO IMPLEMENT ADJUSTMENTS

Guidance at all levels of command to implement adjustments should be clear enough so that consistency is maintained, and there is no misunderstanding at subordinate levels. At the same time, guidance should be flexible enough so that subordinate operators are not overly restricted in adapting command guidance to the characteristics of the particular target population. Operations and procedures must be responsive to changes in the situation, to new information, and to lessons learned.

LIMITATIONS

Strict attention must be given in the planning process to limitations (explicit and implicit) in national policy and international law pertaining to the treatment of prisoners of war. United States policy is to place a broad interpretation on the Geneva Convention pertaining to prisoners of war, and to establish protection in excess of the minimum required by a narrow view of GPW.

PROHIBITIONS

Prisoners of war will not be used, even voluntarily, to contribute directly to PSYOP in such ways as preparing signed statements or tape recordings. Individual identifiable photographs implying active contribution to propaganda will not be used.

PROGRAMS FOR PRISONERS OF WAR

Subject to security considerations and camp discipline, PWs and internees are encouraged to participate in information, education, and recreation programs and activities. Programs include formal and informal instruction in basic educational subjects and vocational training.

INFORMATION PROGRAMS

Information programs are a sound basis from which to initiate other types of programs. Straight news reports may be the best first step in a phased operation aimed at pro-enemy and activist PWs and internees. Reports of enemy failures or losses should be published, posted, and broadcast. When possible, use enemy news sources without commentary. Permit the PWs to draw their own conclusions.

EDUCATION PROGRAMS

From a PSYOP point of view, appropriate courses for a PW and internee education program include:

- A history of the war and its causes.

- A comparison of the origins and developments of a democracy as opposed to a totalitarian form of government and ideology.

- Life in the free world.

- Leadership development and skills in group action.

- Reconstruction plans and the way they affect prisoners of war.

VOCATIONAL TRAINING

Vocational training, e.g., technical, agricultural, etc., is an important part of the education program.

Such training will assist the PW or internee in preparing for repatriation. This may motivate him to perform well and give him more favorable attitudes toward the United States.

At the same time, the program may supplement the camp food supply, contribute to camp construction and maintenance, and reduce the costs of internment to the United States.

Some nationalities or groups may resist many types of vocational training. To insure success, programs must be based on target analysis.

INFORMAL PROGRAMS

The informal program reaches into all phases of PW everyday life. Subject to the limitations discussed earlier, and the wishes of the PW compound commander, PSYOP informal programs should be carefully designed and conducted to achieve the objectives of the camp commander and the PSYOP program. These programs are continuous throughout internment. The general treatment of the PW and internee is a major part of the informal psychological operations program.

IMPLEMENTATION OF PSYOP PROGRAM

In general war, a PSYOP battalion (prisoner of war) may support the theater military police prisoner-of-war command.

The battalion advises and assists PW camp commanders in planning, implementing, and supervising the PW education program. It also assists in:

- Interrogating PWs for information essential and peculiar to PSYOP.

- Pretesting PSYOP material for possible effect before dissemination.

- Determining the effectiveness of selected PSYOP programs.

USE OF CIVILIANS, PW AND CIVILIAN INTERNEES

Where languages other than English are spoken, language-qualified teachers from allied countries are normally employed. This may, however, be undesirable when the available nationality is resented by the target population.

Carefully selected, qualified PW and civilian internees may be used as instructors as long as they are under the supervision of camp authorities and their use is in accordance with US policy and international law. This is desirable psychologically, because it involves the target population in the program. However, security considerations and lack of supervisors may curtail this type of program.

ANTI-ENEMY ORGANIZATIONS

In inclosures classified as "political defectors," "probable anti-enemy," or even "nonpolitical," formation of anti-enemy groups should be encouraged, but their activities controlled. Such groups make it easier to channel the energies of the PWs or internees to US purposes. Such groups also tend to counter the activities of pro-enemy groups and agitators.

Anti-enemy PWs and internees can be used as advisors in the administration, education, and exploitation of neutral and pro-enemy PW and internees.

The training and performance of PW and internee instructors and other cooperating personnel must be closely monitored to insure that hostile elements in the group are not subverting the effort and using training sessions and facilities to harm US interests and to disrupt camp discipline.

Active pro-enemy PWs may deliberately destroy equipment, waste supplies, sabotage projects, subvert camp authority, and undermine US influence and control.

Educational and PSYOP equipment and facilities, such as classrooms, meeting rooms, and reproduction and sound equipment, must be secured to assure that they are not being used for anti-US activity. Sports and vocational training equipment should be controlled so that it cannot be converted to weapons.

PSYOP officers participate in contingency planning for control of disturbances in camp compounds. Designated PSYOP units participate in rehearsals and disturbance control.

PART TWO

PSYCHOLOGICAL OPERATIONS FOR THE PSYOP COMMANDER/ UNIT/STAFF

Chapter Nine

BEHAVIOR FACTORS

9

The psychological operator's key to success is knowledge--knowledge of why people behave as they do and how to persuade them to behave in a more desirable manner. This chapter presents a treatment of this subject. Technical terms, which are not self-explanatory, are found in appendix H.

The target audience is guided and limited by social and psychological factors. The psychological operator must recognize the factors influencing individual/group behavior, use these factors to gain the attention of the target audience, and communicate with and motivate the target audience to alter their behavior and attitudes. The principal psychological factors to be examined are **perception, motivation, frustration, and attitude**.

Perception.....	9-2
Motivation.....	9-5
Frustration.....	9-7
Attitude.....	9-11

PERCEPTION

The perception of the target audience is influenced by biological (or physical) capacities, frames of reference, learning, past experiences, and cultural and social environments. Knowing these influencing factors helps in determining the stimulus which will affect the target audience.

The individual is in contact with his environment through the general sensory systems. The sensation acquired by stimulating the sensory systems is influenced by cultural preferences. For example, as the result of his cultural background, an individual will exhibit a preference for a given color (visual), a particular style of music (aural), a certain odor (smell), a special taste, and/or a particular touch. These sensory preferences enhance group unity and individual identification with the group. They have the power to act as a stimulus, causing desirable behavior to occur.

In determining the influencing stimulus, the psychological operator has two approaches. The first approach involves defining the behavior to be changed and identifying the cause of that behavior. By closely examining the target audience's language, customs, mores, tradition and habits (folkways), laws, and values, the behavior and its cause are properly interpreted within the target's culture.

The stimulus may not be found in the above cultural variables. To overcome this problem, a second approach suggests the behavior be observed and numerous stimuli be presented to an individual or group to determine which stimulus causes a desirable response. By providing medical care, food, or other stimuli after an individual or group has defected, other potential defectors will be prompted to defect, expecting medical care, etc.

In some instances neither the stimulus (cause) nor the behavior are observed, leaving the responsibility of presenting a stimulus and inferring a responding behavior to psychological operations personnel. The stimulus (cause) must be consciously evaluated (perception) after it is received by one or more of the sensory systems.

The key to influencing the evaluation process is found in the presentation of an attention-gaining sensory image. The attention-gaining factors may be categorized into those perceived externally and those perceived internally. The external attention-gaining factors are intensity and size, contrast, movement, repetition, and novelty. These factors when employed by the psychological operator may stimulate the target audience to a more desirable behavior.

The **intensity** of a loudspeaker or leaflet operation can strongly affect those near the loudspeaker or see the leaflet. The attractiveness/repulsiveness of the sound or the appealing/shocking color of a leaflet gains attention. **Size** is relevant. The fundamental principle is that the most stimulating intensity or size is defined by the culture of the audience.

Perception of a stimulus is often influenced by the degree of **contrast** between an object and its background. The conspicuous difference may be used to gain the attention of a target audience. Contrast may be created through differences in color, shape, or intensity between the propaganda and its background or between the propaganda and other disseminations. For example, orange leaflets are attention gaining when the operation is conducted in green jungle foliage. The factor of contrast is easily employed, but an effective contrast is dependent on the cultural definition of the degree to which contrast is tolerable.

The factor of **movement** involves the stimulation of the visual and aural senses. To gain the attention of a target audience, a perception of motion must be created. The best possible attention-gaining situation is the creation of movement against a motionless background. This factor may be employed for the visual sense by a television production, or by movement on printed matter created through suggestive eye direction or mechanical eye direction. Movement can be created for the aural sense by the use of a loudspeaker to duplicate the movement of a troop unit (cover/deception).

The attention-gaining factor of **repetition** is one of the most difficult to employ. The target audience's probability of perception is increased by repetition as well as their sensitivity to a particular sight or sound, but prolonged repetition may reduce the attention-gaining potential of the stimulus. To prevent this, an intimate knowledge of the culture must be available to sense when a stimulus is losing its potential.

A stimulus may be quickly perceived if it is a new sight or sound and is markedly different from the old, more familiar stimulus. It is the innovative approach of the psychological operations personnel that forms the bounds of **novelty**, for a new, markedly different stimulus may be the one perceived by the target audience.

The internal attention-gaining factors are motivation and set. In contrast to the external factors that attempt to create a predisposition, these factors concentrate their attention-gaining potential on the target audience's predisposition to a behavior.

The factor of **motivation** relies on the target audience's conscious, learned, and goal-directed predisposition. Members of a target audience may be predisposed to acquire security for their families. By explaining the benefits of defecting in a persuasive message, the attention of members of the target audience may be gained and this predisposition reinforced.

The **set** is an unconscious vague awareness that focuses the attention of the individual or group. For example, refugees wandering aimlessly along the main line of communications, suffering from cold, hunger, and other physical discomfort, will be attracted to a persuasive message that offers warm clothing, lodging, food, and medical care and will not be attracted by appeals to return to their homes or to conduct sabotage.

MOTIVATION

The psychological operator by utilizing the guiding components of perception can create **motivation** toward more desirable behaviors (i.e., individual defections or group surrender).

Research must begin with a close study of the target audience's culture. The research provides detailed knowledge of their needs, whether the needs are unconscious predispositions to sustain life (drives) or drives consciously learned (motives). The needs may not be perceived by the target audience, or its members may not know how to satisfy them. Psychological operations personnel are responsible for guiding and/or stimulating perception of the needs that are found in the form of drives to more desirable behaviors and for redirecting and/or stimulating perception of needs/motives to other more desirable behaviors. A behavior to relieve hunger may be stimulated and guided by a persuasive message. The message may state where and how food can be acquired if the individual or group surrenders. In each instance the need creates a behavior that is goal directed; an individual or group is driven or motivated toward culturally defined goals; i.e., a soldier is persuaded to surrender and receive food to satisfy his hunger.

The needs of an individual or group are continuously appearing in the form of drives and motives to stimulate behavior toward a goal and the simultaneous satisfaction of a need. As a need is satisfied, other needs may appear to be guided, redirected, and/or stimulated. The appearance of other needs begins the motivational cycle anew as shown below:

Motivation begins with a need. This gives rise to instrumental behavior which, if successful, leads to a goal. This, in turn, relieves the need.

FRUSTRATION

The target audience is not always successful in attaining its goals. When a desired objective/goal is not achieved, an individual or group tension/inner conflict is created: **frustration**. It is the task of the psychological operator to recognize the sources and results of frustration. With a deep understanding of these factors, frustration can be used to channel the target audience into more desirable behaviors.

The individual's or group's frustration comes from three sources: environment obstacles, physical and/or mental limitations, and motivational conflicts.

The individual or group may perceive, unconsciously or consciously, a need for food, ammunition, and medical supplies. The psychological operator may utilize environmental obstacles to block access to these needs, such as communicating that friendly troops have captured the target audience's supplies or are otherwise preventing the target audience from satisfying its needs. The environmental obstacles are of benefit only if the obstacle channels the target to other need-satisfying behavior; i.e., defection or attacking a planned ambush site.

Members of the target audience may perceive a need but be physically and/or mentally unable to achieve satisfaction of the need. The persuasive approach to achieve needs must be physically and mentally accessible to the target audience to channel need-satisfying behavior. This implies a psychological operations message must be composed of the culturally determined language and words. The message presented must be culturally acceptable, it must be presented on the target's intellectual level, and any action required must be within its physical capabilities.

The internal tension or motivational **conflict** of the individual or group arises when two or more equally important needs are incompatible with its goals; when two or more undesirable but necessary needs are incompatible with its goals; or when one need is desirable and the other is not and the goals are incompatible, yet each need requires simultaneous satisfaction. These conflict conditions are categorized as approach-approach conflict, avoidance-avoidance conflict, and approach-avoidance conflict.

Under the condition of **approach-approach conflict** in which the needs are equally desirable with incompatible goals, one **need** must be presented as more important than the other, or one **need** as undesirable while channeling the target audience's need-satisfying behavior. Similarly, the incompatibility of goals can be brought to the attention of the audience to reinforce the need selected for a persuasive message. A group, for example, may desire to totally commit itself to fighting for its country and equally desire to survive. Both needs are equally important to the group, but the psychological operator may imply the goal of fighting is incompatible with the goal of surviving and suggest the group survive by defection rather than die fighting.

The condition of **avoidance-avoidance conflict** presents two undesirable needs and incompatible goals to the individual or group. For example, the individual may find it undesirable to fight (need) and undesirable to die at the hands of a firing squad for cowardice (need). Likewise, the goals of not fighting and not dying due to cowardice are incompatible. A persuasive message may imply that the individual should defect and avoid fighting; if he decides not to fight, he will die.

The **approach-avoidance conflict** is a condition in which there is a desirable need, an undesirable need, and a desirable goal. The individual may desire to fight (need) for the honor of his country but finds dying to be an undesirable aspect of fighting. The goal to survive brings fighting for honor and imminent death as a result of fighting into conflict. The psychological operations personnel may appeal to the individual's desire to survive, building up the need to survive and downgrading the need to fight.

By channeling need-satisfying behavior toward defection as a means to survive and avoid fighting, the PSYOP mission is successful.

The results of frustration can be constructive for our forces, disruptive for the individual or group, or manifested in defense mechanisms which draw the individual away from persuasive approaches.

The constructive results of frustration are:

If an individual or group is persuaded to perceive needs which neither he nor his group can satisfy, the individual may **intensify** striving to escape from the group or to make changes in the group.

The individual or group may be persuaded to such an extent that **the means are changed to goals**. Defection may have been a means to survive, but the persuasive argument may be so strong the individual or group may defect not for survival but to defect.

The frustration may cause the individual/group to **substitute goals**. This is a key result for the psychological operator if the substitute goals are provided by him (i.e., defection or surrender).

The individual or group may be persuaded by the psychological operator to **redefine the situation** (i.e., battlefield environment) to one that is undesirable, if not untenable. In which case, the target may be persuaded to defect or become subversive.

The disruptive results of frustration are:

If the individual is not given a means to satisfy his need/goal within his own culture, his frustration may be channeled **against himself**, his group, or into aggression against our forces. It is the responsibility of the psychological operations personnel to provide a means to satisfy his need/goal and thereby subvert the individual or group.

The individual or group may be blocked from satisfying needs/goals to such an extent **escape** is the only alternative. By knowing the needs of the individual or group, a persuasive message may offer to satisfy needs/goals as additional motivation to escape/defect.

The frustration of the individual or group may result in an increase in **anxiety/conflict**. By recognizing anxiety-producing situations, a means of relieving the conflict can be provided and a more desirable behavior acquired.

As anxiety/conflict increases, the group will unconsciously constrict its environment to protect itself from dangerous instinctual demands and conflicts. The protection is offered in the form of defense mechanisms which repress some aspect of reality and reconstruct that aspect in a manner helpful to the group's enhancement and approval. The objective of the psychological operator is to eliminate the reasons to develop mechanisms or to guide defense mechanisms to more desirable behavior. The most common mechanisms of defense are repression, displacement and sublimation, fixation, regression, projection, denial, reaction, formation, identification, and rationalization.

The individual/group may receive stimulation to perform a certain behavior. Due to the defense mechanism of **repression**, the stimulus and its associated behavior are forgotten and held in the individual's/group's unconscious memory. A defection message may be received, ignored (behaviorally), and held unconsciously due to the dangerous demands and conflicts defection implies.

The defense mechanism of **displacement** is characterized by repression of a source of anxiety/conflict and attributing the tensions to another source. A closely related mechanism, **sublimation**, applies the characteristics of displacement and the characteristic of anxiety/conflict being expressed in other than the routine manner. Displacement could be employed by an individual/group blaming the intolerable living conditions on other individuals/groups rather than the real source, the individual's/group's leader. The mechanism of sublimation could depict the target audience as physically striking out at other individuals/groups rather than using their routine verbal manner of expression.

In another anxiety/conflict ridden environment, the group may defend itself by **fixation**, a temporary or permanent halt to the group's development. This may mean the group will no longer follow the progression of persuasive messages due to the anxiety/conflict they produce.

The mechanism of **regression** results when anxiety/conflict cannot be reduced, forcing the individual/group to suppress the anxiety/conflict and return to a time when the tensions were not present. For example, the individual/group may be subjected to persuasive messages that stimulate the individual/group to think back to more pleasant times and block out the intolerable conditions the persuasive messages revealed.

The tendency of the individual to attach to others the motives which he senses within himself, but might be painful to acknowledge, is labeled as **projection**. A persuasive message could point out the benefits of defecting. The individual may not believe the message; if he were writing a similar message, he would use the same tricks to draw other individuals/groups out of hiding. The individual has, in this example, attached his devious motives to the persuasive messages of others.

The group may attempt to deny the existence of an anxiety/conflict-producing source. By employing the **denial** mechanism, the group may deny the need to defect; to it the problem of poor medical attention no longer exists. This feeling is in opposition to the reality that medical attention remains poor.

The anxiety/conflict produced is often repressed and new behaviors are developed to reflect an opposite side of the individual/group. This defense mechanism, **reaction-formation**, is characterized by extreme behavior inappropriate to the situation. This protective mechanism, when expressed in a persuasive message to defect and live for another day, may be met by an increase in aggressive resistance. The individuals want to

defect, but this is so foreign to their commitment that they must repress the desire and fight with renewed resistance.

The defense mechanism of **identification** leads the individual to repress his anxiety/conflict and model/imitate someone who is feared, loved, or admired. These factors could portray an individual/group repressing his inadequacies and imitating the successful approach of a feared leader.

The individual/group can protect itself by **compensation**; that is, failure is repressed and overachievement in a related skill is pursued. Failure to be a marksman could lead to the individual's/group's overachievement in the skills of supply, first aid, or communications.

By using the defense mechanism of **rationalization**, the group attempts to justify its behavior and presents itself to be righteous to both self and other groups. Through this protective mechanism, the group can defect honorably if the justification is accepted as best for the group or country.

ATTITUDE

The individual/group is so structured by culturally determined sensory perception, stimuli, motivation, and frustration that the psychological operator must find an influential key to their culture. This key is attitudes which positively or negatively orient the individual's perception, motivation, and frustration.

Attitudes are important for they influence reactions, are reflected in behavior, exert a consistent influence, are subject to change, and subsequently influence behavior. More specifically, attitudes influence an individual's/group's orientation to his/its culture. By closely observing the orientations, a consistent influence can be observed in a wide variety of behaviors directed toward someone or something. Conversely, as attitudes are reflected in behaviors, behaviors reflect the attitudes of an individual/group. A primary objective is to identify the key attitudes of a group that when changed will make it vulnerable and susceptible to a persuasive message.

The influence of attitudes can be distinguished on three major levels: the cognitive, the emotional/affective, and action/behavioral.

- 1 The **cognitive level** is the inner orientation of an individual/group which serves to construct a picture of someone or something. The orientation is particularly concerned with the perceptions, beliefs, and the common traits attributed to someone or something. The individual/group may picture others as lazy, mentally inferior, unpatriotic, treacherous, ruthless, bloodthirsty, or cowardly.
- 2 The attitude may orient the individual/group to express certain feelings when a given stimulus is presented. The feelings, found on the **emotional level**, may be presented by fear, anger, hatred, contempt, envy, pity, sympathy, or love. The appearance of a massive force may stimulate the individual/group to invoke the emotions of fear, anger, or hate.
- 3 The **action level** for the individual/group refers to the tendency or disposition to act. A persuasive message which exposes the intolerable living conditions may create a tendency for the individual/group to defect.

Having explained the concepts of perception and its attention-gaining factors, motivation and its origin and goal, frustration and its sources and results, they must be applied to influence foreign

policy decisions, the determination of military missions, the ability to govern, the ability to command, the will to obey and support, and the will to fight. Despite the magnitude of the task, the principles can be expressed in a single term, attitude change. This collective term represents the relationship between the psychological operator's desired attitudes (and more desirable behavior) and the individual's/group's attitudes as well as the degree of receptiveness between the individual/group and the psychological operator (change agent). The psychological operator may bluntly suggest the individual/group accept defection as a reasonable alternative to fighting, an action for which the individual/group has a negative orientation (attitude). In this situation, receptiveness has not been cultivated in the individual/group and an attitude change has been suggested that is in direct opposition to the individual's/group's orientation.

The more subtle approach to attitude change is expressed by the concepts of compliance, identification, and internalization.

The psychological operator may frequently employ coercion or force to imply the individual/group will be rewarded or will gain approval and avoid punishment/disapproval if his behavior complies with that specified by the psychological operator. The **compliance approach** allows the desirable attitude to replace the more traditional attitude; if a reward is not provided as implied or punishment does not cease, the individual/group will change back to the traditional attitude and behavior. This approach insures short-term behavior compliance but may produce a negative attitude in the target audience.

The **identification approach** depends on the receptiveness of the individual/group and the gratifying relationship between the psychological operations personnel and the individual/group. Under ideal conditions, the individual/group models itself after the psychological operator due to the desirability of the relationship. The willing commitment involved in this approach to change is more likely to persist for it is not dependent on reward or the avoidance of punishment.

The most significant attitude change, yet the most difficult to achieve, is internalization. The **internalization approach** identifies attitudes that can be used to accomplish our goals yet be consistent with the accepted attitudes of the individual/group. If consistency is gained, long-lasting individual/group attitudinal and behavioral changes will result.

In support of the approaches to attitude change, social support, support of experts, and support of experience can be used to lend credibility to attitude-changing messages.

The social pressure brought by **social support** forces the individual/group to conform to a more desirable attitude if a reward of social acceptance, prestige, increased status, esteem, praise, achievement, and recognition is expected. It is the psychological operator's objective to amass social support and build on that support; i.e., persuading a group to defect and using their name to illustrate to others the rewards received for their behavior.

The **support of experts** that are knowledgeable or powerful provides the stimulus for individuals/groups to change their attitudes. The psychological operations personnel can quote these experts or enlist their assistance as key communicators (see chapter 10) to bring about persuasive attitude changes.

The **support of experience** is the most powerful tool available to use in attitude change for it calls upon individual/group perceptions to point out their attitude is consistent with the attitude and behavior sought by the psychological operator.

*Chapter Ten***COMMUNICATING**

Communications can arouse needs and emotions and persuade a target audience to change attitudes and subsequent behavior.

This chapter will provide an understanding of communications and their importance to PSYOP.

THE COMMUNICATION PROCESS

Communications, the exchange of information and ideas, is possible only to the degree that individuals have common knowledge and interpretation of the language used. It is the primary PSYOP method for arousing needs and emotions, and changing opinions and attitudes.

Social communication is the process of exchanging ideas, sentiments, and beliefs, usually by use of language, but also by visual representation and imitation. In human groups, it is largely a process of social interaction.

Words, the basic component of language, permit the expression of ideas and play a basic role in changing the environment, thus affecting culture and society. The planned use of words can bring about lasting changes in behavior, concepts, attitudes, and emotions.

Language, as the means of communication, performs three vital functions in every culture:

The most basic function is informing individuals and groups by using the stable and commonly agreed upon meanings of words, symbols, or actions.

The psychological effect of language is an extension of the informing function. By informing, it arouses the emotions of the target audience and produces a psychological effect on others. It influences them to react with a desired activity or attitude, such as fear, apathy, sympathy, pity, dissatisfaction, verbal confrontation, or aggressive action.

The ritual function creates and reinforces the attitudes strongly associated with particular institutions, such as the church, mosque, temple.

In practice, it is almost impossible to separate the functions of language. The difficulty arises when language has the primary function of arousing emotions and stimulating actions, while the target is led to believe that it is being given the facts about actual events. This is best illustrated in the fields of political and economic discussion where terms such as "liberty," "democracy," "imperialism," and "free enterprise" perform all three functions simultaneously.

In **persuasive communications**, attention must be paid to three important factors: transmission, interpretation, and the communications situation.

Communications must be transmitted and interpreted within the framework of a particular society or culture. Too often, an operator erroneously uses the most readily available means of communications, even though it is not the most effective channel for reaching a particular target audience. Each society is affected differently and in varying degrees by mass media, interpersonal communicators, and the numerous formal and informal groups, such as the family, church, occupational clubs, gangs, and cliques; work, pub, and cafe cronies; professional, art, and cultural societies and colleagues. Each serves a communications purpose within a society, differing in its credibility and impact according to subject matter.

The communications situation must be closely examined. The psychological operator must know who is listening to his appeals, who is looking at his visual and audiovisual propaganda, and who is reading his message. He wants to be certain that the target he wants to affect can be affected by the **communications channel** he intends to use. It is a waste of resources to use radio when newspaper or magazine articles have the greatest impact, or to use printed media when radio has the greatest credibility and effect.

Not only must the communication be based on facts and reality, and the media be appropriate to the audience, but the message must also be appropriate to the situation in which the audience finds itself. The psychological operator must also give thought to the options to act available to the target. The most effective message will be that which makes sense (is rational) to the target audience, furthers the target's self-interest, and is to it moral and ethical. The psychological operator should present his appeals in that light.

The communications process involves four steps: gain attention, hold attention, have an acceptable message, and acquire feedback.

GAIN ATTENTION! Prior to launching a persuasive message, the analyst must be sure the message will gain the attention of his target audience and stimulate perception. This demands a message that will successfully compete against other events, appeals, persuasion, threats, demands, etc. The impact of the message must focus attention on the message and be appropriate for each target. The opening that will gain the interest of the farmer may be completely ignored by the school teacher. The opening that will enthrall the religious leader may leave the union organizer apathetic. If the persuasive message has the desired attention-gaining quality, it will be evaluated by being read, listened to, and being looked at.

HOLD ATTENTION! Once gained, attention cannot be permitted to waver. The target must read it all--listen to it all--or view the entire visual presentation. This requires that the communication be couched in the common language of the target, the language which affects its emotions (individually and collectively). A basic means of accomplishing this is to use words, symbols, and actions similar to those associated with persons whom, in memories of youth, the target recalls as loved and respected authorities; i.e., parents, teachers, friends, clergy, etc.

HAVE ACCEPTABLE MESSAGE! Having been listened to, looked at, or read in its entirety, the message must be accepted. It must appeal to the dominant interests of the target audience, offering THE SOLUTION to the most urgent problems of its members. This requires that the message delineate lines of action appropriate to the target in his or her situation. Propaganda will be most readily accepted when it refers to feasible actions that the target can perform with integrity. The test is a simple one: The propagandist must put himself (figuratively) in the target's situation and ask himself (as the target), "What would I do under these conditions? Accept the message or ignore it?"

Use media that the target trusts and that has the greatest impact. The target will not readily accept messages in media that he or she does not trust nor consider authoritative.

The message must be credible (believable) to the target. But it need not be unbiased in fact. Credibility is in the mind(s) of the individual or group who judge the message in terms of their own experiences, not solely on fact. The message that does not focus on the important interests of the target; does not offer the best realistic solutions to their problems; and is not presented in the appropriate language, in media and format, familiar to and respected by the target, will suffer from a lack of credibility.

The psychological operator cannot know whether his propaganda was incredible, credible with no impact, or credible to the point of affecting the actions and attitudes of the target, as desired, until he receives feedback.

FEEDBACK! Feedback is information that reports the effects, or discrepancies between the intended and actual effect, of a PSYOP campaign. Analysis of feedback should lead to modification of a campaign to improve its effectiveness.

Feedback must be target oriented, considering differences in the subgroups that may constitute a major target group and situational changes which occur with drastic rapidity in time of conflict.

Feedback requires systematic research:

Interviews conducted with carefully chosen members of the target groups should determine campaign results, and if possible the reasons for those results, by seeking factors such as morale, attitudes, overt behavior, and other indicators of the impact of the psychological operator and its propaganda. If the target cannot be reached, informed persons, e.g., refugees, exiles, scholars, reporters, and others intimately connected with and having in-depth knowledge of the area and target, should be interviewed, keeping in mind that each has a subjective point of view. These points of view may be justified, but, nonetheless, they are the basis for biased judgments and statements.

Although other types of feedback indicate success or failure, they will not always tell why a campaign, theme, or message failed or was a partial success. Posttesting will uncover the reason(s) for audience reactions. The techniques of posttesting and pretesting are the same. However, the same persons must not be used.

The propagandist must have total empathy with his target. This does not involve sentimentality nor sentiment. It involves the ability to understand people--the ability to project oneself into the other person's situation and be able to think, see, feel, and reason as he does. This ability is one of the most important requirements in giving common meaning to the message.

The US psychological operator has his message to communicate, but successful communications depend on certain basic requirements:

Personal contact. The success of personal contact with the target audience establishes the effectiveness of communications.

Identifying target audiences. The psychological operations personnel must employ skill in identifying target audiences; in determining their needs, attitudes, vulnerabilities, and susceptibilities; and in selecting the means of communication.

Selecting PSYOP personnel. The criteria for selecting PSYOP personnel should be capability and skill rather than their military versus civilian identification. Neither category has a monopoly on imaginative skill or the ability to influence people.

While the empathetic psychological operator has the skill to put himself into the "role of his target," he must also have the facts to enable him to do so under prevailing conditions. This intelligence must relate to the environment affecting the target. While the physical environment is important, the social attitudes and environment of the target are more important.

To fully understand the process of standardizing and exchanging subjective meanings using words, symbols, or actions, the psychological operator must analyze the components of communication. A means of analysis is a **communication process model** (figure 10-1).

A typical model consists of a stimulus, sender, receiver, message, transmitter, encoding, decoding, feedback, and noise component.

FIGURE 10-1
COMMUNICATION PROCESS

A **stimulus** is any change agent that causes a response.

A **sender** (encoder) is the initiator of the message.

The **receiver** (decoder) is the intended addressee of the message.

The **message** is a word, symbol, or action or a grouping of words, symbols, or actions used and controlled by a sender.

The **transmitter** is the means used for presenting the message; i.e., writing or the human voice.

The **encoding process** is the structuring of words, symbols, or actions to form a message having a shared meaning among individuals/groups.

The **decoding process** is the translation of a message to give it meaning. The ideal situation is to have the receiver translate the message with the shared meaning the sender used for encoding.

The **feedback** is the information returning from the receiver to the sender by the same communications process mode, signaling an acceptance, rejection, or noncommittal response to the message.

The **noise factor** is anything which interferes with the transmission or reception and subsequent perception of the intended message.

If psychological operations personnel are to be consistent in their efforts to form a persuasive communication, they must be concerned with the reasons for the success or failure of the message.

A persuasive message must incorporate variables of policy, intelligence, a general theme, and the command's desired results.

The target must be motivated to perceive a persuasive PSYOP communication (message), in spite of interference with its transmission, reception, and subsequent perception. To meet the challenge, an attention-gaining, stimulating, timely message must be transmitted.

The message is important to the target audience **only if it can be understood**. It is the objective of the psychological operator (encoder) to guide understanding by using words, symbols, and actions that have a known and accepted meaning to the target. For example, figure 10-2 shows the difference of meaning for terms given in standard American and Soviet dictionaries.

Word	Soviet Meaning	American Meaning
Individualism	The individual as a member of a collective.	The pursuit of individual rather than common or collective interest.
Freedom	The recognition of necessity.	Exemption from necessity, in choice and action; as, freedom of the will.
Charity	Help granted hypocritically by representatives of the dominant class in societies of exploiters to a certain fraction of the disinherited sectors of the population in order to deceive the workers and to divert their attention from the class struggle.	An act or feeling of affection or benevolence.
Initiative	Independent search for the best way to fulfill a command.	Self-reliant enterprise; self-initiated activity.

FIGURE 10-2
DIFFERENCES IN MEANING

The immediate goal is to cause desirable behavior which will satisfy **perceived needs**, arouse a perception of **dormant needs**, or stimulate a perception of **new needs**. To accomplish these, the persuasive message must stimulate an awareness of the behavior required to satisfy perceived needs, dormant needs and their satisfying behaviors, or new needs. If stimulation is successful, the individual or group may change their attitude(s) and behaviors as urged or implied by the message.

MASS COMMUNICATIONS

There are two types of message carriers: mass communications and face-to-face communications. **Mass communications** are directed toward selected target audiences with specific needs; the level of communication, the languages and dialects, and the content of the message are tailored to the society addressed; e.g., the blue collar worker versus the executive. Regardless, the individual or group retains the option to select the mass communications it accepts.

It can be looked upon as a two-step process as shown in figure 10-3. **Step one** occurs when the persuasive message is transmitted by mass media to the key communicator. **Step two** occurs when the persuasive message is transmitted from the key communicator to the individuals and groups composing the society.

FIGURE 10-3

TWO-STEP FLOW OF MASS COMMUNICATIONS

The reason for the two steps is that mass media does not reach, nor is it internalized by all people. Many who receive the message do not have the desire to internalize it. The key communicator has the time, desire, and ability to receive a persuasive message. It is the intent of the psychological operator to exploit this receptiveness, enlisting the key communicator's help to reinforce mass media and face-to-face communications.

The key communicator furnishes the average individual secondhand information and interpretation concerning that which they have heard, seen, or read. He persuades the individual or group to change or reinforce their opinions, attitudes, emotions, and behavior. The key communicator can reduce the uncertainty of bringing about the desired behavior. He is the one to whom PSYOP messages should be directed.

INFORMAL COMMUNICATIONS CHANNELS

The communications process merely starts with the transmission of the message by way of the mass media. The important step is the penetration of the informal societal communications channels; i.e., the beauty parlor group, the women washing clothes on the river bank, the barbership coterie, the student clique, the luncheon club, the tea (coffee) house, etc. Discussion within these groups keeps the ideas of the propagandist alive and hopefully leads to acceptance and action.

A man's behavior, attitudes, and opinions are most strongly influenced by the groups to which he belongs. The stronger his attachment to the group, whether out of fear, awe, respect, or intellectual or sentimental attachment, the greater the group influences his lifestyle.

The most important institutionalized channels of social communication that must be penetrated are the family, religious center and school, and in totalitarian countries, the governing political party. These institutions are the centers of authority and social control, charged with the responsibilities relating to the primary functions of life; i.e., child rearing, education, companionship, marriage, morality, and death. They evoke the deepest sentiments, loyalties, and expectations.

ADVANTAGES OF MASS COMMUNICATIONS

Mass communications have many advantages:

The **instant** a persuasive message is constructed it can be transmitted great distances and received by a large number of people, individuals, and groups.

Mass communications can be **intensely emotional and unrelenting** to dramatize and lend credibility to needs and the desirable behavior to satisfy them.

Despite the selectivity of a mass communication target, numerous nonselected people are subjected **indiscriminately** to the message transmission.

The mass communication, due to its purpose of reaching wide ranges of audiences, is constructed to be perceived by the common denominator. Thus, a persuasive message may be constructed for transmission to the middle class with the calculated objective of gaining the attention of the lower upper class and the upper lower class.

People band together in a society to satisfy self-preservation and self-maintenance needs. Through mass communications, attention can be focused on these **broad societal needs** to change the attitudes of mass audiences as opposed to the limited individual face-to-face approach.

The psychological operator **must not assume** that audience needs are limited. Few societies exist whose needs are not expanded through exposure to mass communications.

INTERPERSONAL COMMUNICATION

Interpersonal, or face-to-face, communication is person-to-person contact within the range of

activities by which people communicate orally in direct face-to-face situations; e.g., rallies, groups, group associations, and social activities. It enables the psychological operator to select the target, rapidly disseminate the appeal, and immediately assess its effectiveness.

ELEMENTS OF FACE-TO-FACE COMMUNICATION

To be effective, the communicator must know specifically what he desires to say, how it should be said, to whom, and where and when to say it.

The Message. The communicator must be certain of the message he wishes to convey. In most situations themes for face-to-face communication seek to generate cohesive behavior. The themes or line of persuasion should be preplanned and questions anticipated.

Presentation. The manner of presentation is of utmost importance. The presentation must be in terms and language which the target audience understands and can relate to its own experiences. It is essential that the communicator know the audience, be fluent in their language, and be able to identify with them.

Audience Selection. Key personnel who influence the opinions of a wider audience are the more useful in spreading the message.

Time and Location. The time and place a message is delivered must be convenient for the target audience. The psychological operator is trying to sell the target audience; therefore, the audience's convenience has a higher priority than the communicator's.

METHODS OF EMPLOYMENT

Controlled face-to-face communication is best used when military forces are in direct contact with the target audience. In most cases, the face-to-face communications network already exists. In some circumstances, the communicator may or must create a situation conducive to face-to-face communication.

Rallies. People gathered to be informed and entertained are susceptible to persuasion and may be stimulated to support a cause. They are usually drawn to rallies by a common interest and a feeling of participation or belonging. Under such conditions, propaganda messages may be accepted by many people of different social and economic levels. Skilled use of rallies and meetings can involve the audience emotionally.

Groups. Small, tightly organized groups are highly effective in spreading appeals. By organizing such groups or exploiting existing ones, the communicator can extend his appeal to larger groups.

Group Associations. Associations, such as youth groups, religious organizations, women's clubs, etc., provide opportunities to expand the impact of the message.

Social Activities. Social activities appropriate to local customs and patterns can stimulate cohesiveness. Such gatherings may serve a propaganda purpose, as well as offering opportunity for social communication.

Person-to-Person Contact. There is no substitute for the intimacy of individual contact. A person is more likely to believe and accept what he hears in the course of a conversation than what he reads or otherwise learns. The propagandist can tailor his appeal to fit the individual's experiences and needs. This tailoring is more likely to achieve results than a mass appeal dependent on an approach targeted at the average intelligence level of the target audience.

Other media reinforce face-to-face communications. The leaflet, pamphlet, or magazine handed to a participant in a mass rally, the poster reminding all of a positive action program, the motion picture or television program to illustrate the speaker's purpose, the printed material given to the individual after an ideological discussion contribute toward the success of the PSYOP program.

TECHNIQUES

Some Tips to Remember

Make each meeting contribute to the entire PSYOP program.

Choose areas free from interruptions and distractions.

Set a time limit. Allow enough time for the meeting.

Choose topics important to the target.

Ask questions. Questions give the audience a chance to actively participate. The audience merely listens to statements. Questions encourage them to listen and speak. They cause action.

Understand responses. Be certain you understand any comment or answer. Repeat, in your own words, what you thought the other person said. If he agrees, you understood him. Do not discuss the point unless it is clear to you.

Be explicit. Explain precisely and make clear to the target audience the problem, the point of discussion, and the required action.

Use concrete words. Avoid words that the audience can or is likely to misinterpret.

Stress all points on which you agree with the target audience.

Avoid minor disagreements. If you disagree on important points, do so politely. Do not antagonize or make the audience sympathetic to the other side. The following techniques will help:

Politely point out that the other side is wrong about some important points. List them.

or

Politely point out that the other side is uninformed. Then make the point: If they had the information, they would change their opinion and agree with you. Give the correct information.

or

Prove the other side is reasoning illogically; and give the right idea.

or

State the other side's reasoning may be partially right but that it does not consider some factors. Then give the facts to support the point you want to make.

Know the subject thoroughly. If you cannot answer a question, **do not lie** no matter how minor or major the issue. Lying destroys credibility.

Make no promises you cannot or do not intend to keep.

Be confident. Control your emotions. Do not give way to emotions that will antagonize the audience.

Reinforce your point. Select evidence that supports your position. In order to avoid charges of bias, you may introduce minor points to support the opposing view.

Encourage the audience to think along lines that lead to the conclusions you want.

Present conclusions to the audience. Sometimes you may have to disguise them. The type of audience determines the extent to which you must do so. Emphasize conclusions on subjects that are unpopular with the target audience.

For the unfriendly or suspicious audience, disguise or present the conclusions as questions, making the desired answer or action appear to the audience to be the logical one. You must present clear, concise, and coherent conclusions to a less educated or apathetic audience. You will insult a well-educated audience by openly presenting conclusions to them. Use carefully phrased questions, making the response you want the only logical one.

Arouse the audience's emotions, but keep them under tight control. Attention-getters may make your appeals more attractive. The attraction must, however, be moderate to reinforce your message and not divert attention. Examples are attractive or popular persons--men or women, depending, among other things, on the culture--presenting a message, the political picnic, entertainment troupes at rallies, and background music.

Have the audience participate. The most effective appeal is that which requires audience participation, if participation verifies the message. For example, if you, the propagandist, tell an audience that a nearby area has been completely destroyed by our firepower, and this is verified by members of the audience, your future credibility will be enhanced.

Generate discussion. A frequent way to get audience participation is to generate discussion, either through questions to the audience or questions or comments from people planted in the audience. Once the discussion begins, the

psychological operator knows that he has awakened an interest, which is encouraged. The psychological operator is successful when the audience is moved from discussion to action.

Present new material or change style. An audience may become bored or resent hearing the same appeals or arguments. The chance of success for an appeal may be increased by presenting new material or by changing the style of presentation.

Rumor

Rumor can be spread by any medium. It can best be controlled or eliminated in face-to-face situations. Rumor thrives when general knowledge of the facts is limited and the conditions or situation which are the subject of the rumor may be subject to ambiguous interpretations. Rumor feeds on the hopes, fears, and desires of a population.

MASS AND FACE-TO-FACE COMMUNICATIONS

The psychological operator must view mass communications as a supplement to interpersonal communications, but he must understand they are **not a substitute** for a lack of knowledge of the culture and society. This dictates:

The absence of equipment must not be used as an excuse not to communicate.

The use of equipment to transmit a persuasive message must be proven necessary.

He must also understand that overdependence on equipment can result in the failure of a message. Success, on the other hand, can be assured if alternate face-to-face (interpersonal) communications are available as contingencies; i.e., rallies, meetings, show-and-tell demonstrations, rumor campaigns, social gatherings, etc.

While mass communications offer the most rapid means to reach the greatest number, the personal touch of face-to-face communications is the most effective way to "clinch the argument" and sell the product. It can be said, "There is a direct correlation between mass communications and face-to-face: The closer mass communications approximate face-to-face, the more effective they become." This is the major reason why famous, noted, popular, widely liked, admired, respected, or loved persons and personalities are widely used in mass communications selling campaigns--particularly in selling ideas.

COMMUNICATIONS BARRIERS AND THE PSYCHOLOGICAL OPERATOR

Barriers

Barriers to effective communications develop due to differences in the meaning of the words, symbols, and actions transmitted among individuals and groups within a culture (intracultural) and between individuals and groups of different cultures (intercultural).

One of the most critical aspects of working cross-culturally is **recognition of differences in cultural values and assumptions**. There are certain experiences

shared by most individuals within a society, so common reactions to an event can be anticipated. These values and assumptions are so much a part of the individual that the target audience will be unaware of how much their behavior is influenced by them.

Words, symbols, and actions being created within a cultural context create communications problems between people from different cultural backgrounds. They do not know the meanings attached to each other's words, symbols, and actions. The cultural influences act as constraints upon cross-cultural communication and can be analyzed as differences in cultural values and assumptions, objectives, and behavior patterns.

Psychological Operator

The psychological operator has learned to work for certain culturally-oriented life goals. His goals may vary significantly with the life goals of those persons selected as a target audience. For example, the objectives of one culture may be oriented toward achievement of harmony with the environment, while another may be oriented toward changing the environment. Such differences are obstacles to understanding and, therefore, to effective PSYOP.

The psychological operator provides the means to interpret only the behavior within his culture. He expresses this interpretation through words, symbols, and actions which, if transmitted by message, may not be acceptable in another culture. A clenched fist, for example, may be a gesture of anger in one culture and a salute in another. Innocuous words in some countries become foul vulgarities in others. In some societies, asking about the well-being of the female members of a friend's family is proper and desirable; in others, it is a serious breach of etiquette.

A possibility of being **culturally biased** must be recognized and every effort made to interpret behavior in terms of the target audience's culture.

In developing messages which will be meaningful to the target audience, the psychological operator must take into account both his and the target audience's cultural backgrounds. He must acquaint himself with the established customs and social taboos of his target audience to prevent inadvertent disparaging remarks or actions. Phrases, comments, expressions, and actions that are normal in our society may be offensive in other cultures.

A problem that deserves special attention is communications with the nonliterate or semiliterate audience. Collectively, this audience represents great potential power, constituting 60 to 80 percent of the population of some countries. The psychological operator must not assume that people identified in other cultures as literate meet his standards. A large number of people who are considered literate in their culture possess such a limited reading ability that they should be classified as semiliterate. In view of their numbers and low status, nonliterate and semiliterate groups are fertile for support of ideas and actions (insurgencies, civil war, revolutions) which promise to alleviate their suffering.

Knowing what this audience considers valid evidence and how they can be convinced is particularly necessary. And identifying individuals they accept as leaders or status people is extremely important. These leaders or status people, who can get the populace to accept an idea, should be the first target of the PSYOP

communication. However, consideration must be given to their traditional methods of decisionmaking. In many cultures, the leader may have no control over the final decision. He can only vocalize the decision reached by the group as a whole.

The psychological operator must recognize that the target has its own language to transmit cultural meaning. It may, therefore, be advisable or necessary to use members of the target audience to assist him in various ways; i.e., as propagandists, translators, advisors, etc. He may also use them, by means of discussions and social activities, to gain an intimate knowledge of their language, values, culture, goals, folkways, mores, customs, and laws. He must realize that for communications purposes the target audience is distinct from other individuals and groups, due to varying demographic, cultural, individual, and sociological characteristics.

Demographic characteristics provide statistics such as age and sex distributions, birth and death rates, race, religion, occupation, income, language, social class, and political affiliations of members of the target audience.

Cultural characteristics consist of all behavior that is learned, shared, and transmitted by words, symbols, and actions. To communicate effectively with the target audience, the psychological operations personnel must have a command of such target audience characteristics as language, customs and traditions, norms, values, ethics, mores, folkways, attitudes, opinions, the social system, the religious system, the political system, the kinship system, the education system, and the economic system.

Individual characteristics that may be available to the psychological operator for analysis and employment are individual and group stimuli, sensation, motives, needs, drives, perception, and frustration.

Sociological characteristics deal with those aspects of the group which can enhance or inhibit communication. These include, but are not limited to, demographic, cultural, and individual characteristics mentioned above.

It is through the group and group processes that attitudes and behaviors may be changed. Therefore, by using a group approach, a successful persuasive message that will be accepted by group members can be rapidly disseminated. Such acceptance will be greatly enhanced if the key communicators within the group are convinced of the importance of the message and convince others within the group.

The psychological operator must give continued attention to message feedback to determine the meanings given to his message by the target audience.

Translations and the Translator

The ideas to be included in a persuasive message must be thoroughly discussed with the translator. The translator must be given ideas and allowed to translate them into the language of the target audience.

By avoiding word-for-word substitutions, in translations, meaningful ideas are presented in the logical order of the target audience's language, as opposed to the fragmented meaning that word-for-word translations can create.

This approach allows the translator to use language that holds the most meaning for the target audience. It also makes easier the construction of persuasive messages in language that arouses the emotions of the audience.

Chapter Eleven

PROPAGANDA AND COUNTERPROPAGANDA

Propaganda is the sales pitch. It's a message with a point of view. It is the deliberate spreading, by any means of communication, of doctrine, ideas, facts, argument, information, allegations, or appeals to advance a friendly cause or injure an enemy cause. This may be done by words, symbols, public action, or other deeds. For a formal definition, see appendix H.

PROPAGANDA

The purpose of propaganda is to bring about behavior that the propagandist desires and to reinforce that behavior with favorable opinions and attitudes. In order to accomplish its purpose, propaganda must fit within the cultural context of the audience. It should also avoid direct attacks on the core beliefs and traditions of the target audience.

EFFECTIVE PROPAGANDA--CRITERIA

The tests for effective propaganda are simple:

Does the propaganda fit within the cultural context of the audience?

Has the propaganda avoided direct attacks on the core beliefs and traditions of the target audience?

To what extent did it influence the target audience to follow the course of action desired by the propagandist?

To what degree did it help the tactical commander? How? Why?

How successful was it in helping to defeat an insurgency and gaining the willing active support of the population? The armed forces?

To what extent did it succeed in enabling the United States to achieve its national policy objectives?

CLASSIFICATION

Propaganda is classed on the basis of source:

White: Its source is openly stated.

Gray: No source is given.

Black: Attributed to other than the true source. This type is normally used to support strategic objectives. It generally emanates from the highest levels of command or government and is disseminated by designated specialists.

White, gray, and black do not refer to the content of the propaganda message. **The terms merely refer to the methods used to carry out the operation.** See "white propaganda," "gray propaganda," and "black propaganda," JCS Pub 1.

BASIS FOR DEVELOPMENT

The following elements are basic to the development of propaganda:

Psychological Operations Objectives

One of the basic factors that determines what is said, how it is said, and to whom it is said is the psychological objective that the psychological operator wishes to achieve. The psychological objective is a statement of a measurable response expected of the target audience as the result of PSYOP.

Target Analysis

Target analysis seeks to identify, locate, and gain psychologically relevant insights about target audiences by a detailed analysis of intelligence. A detailed analysis of target analysis is found in chapter 14.

Target Audience Interests

In order for propaganda to appeal to an audience, it must be pertinent to the interests of that audience. It must satisfactorily answer the questions, "What do you want me to do?" "What's in it for me?"

Detailed Current Intelligence

Detailed current intelligence is needed for successful propaganda. For a discussion on the use of intelligence in PSYOP, see chapter 14.

Production

An important question facing the propagandist is the availability of media facilities; for example:

Are press, inks, paper, and other printing supplies available?

Are radio and television production facilities available?

Can audiovisual material be locally processed?

Dissemination

Not only must propaganda be produced, it must also be disseminated. The psychological operator must determine whether he has the means available to effectively disseminate propaganda. For example, is radio and television transmitting equipment available?

Credibility and Impact of Media

In planning propaganda campaigns, themes, and messages, the psychological operator must know the credibility attached to each medium by its target audience and the impact of that medium. He must also know media patronage profiles. Credibility and patronage vary with the target audience and the media used to spread the message. The psychological operator must also know the type of audience each medium attracts and its characteristics.

Suitable Language

Frequently the audience may take great risks to hear or read a message, and must do so quickly. The message must be worded to permit them to do so.

Priority of Interests

Not only will the language vary, but priority of interests must be considered. For example, the priority of interests of peasants are not the same as those of city merchants; nor are those of city merchants the same as those of university students; and none of these are the same as those of a soldier under artillery bombardment.

Pretesting

All propaganda must be pretested before it can be disseminated. Pretesting gives the psychological operator a good idea of the potential credibility and effectiveness of his message. The selection and use of a particular pretest method must be based primarily on the accessibility of the target audience to PSYOP personnel.

Survey sampling is the most reliable method of pretesting propaganda. This method requires personal solicitation of the members of the target audience. In this way, empirical data is obtained from the intended recipients of propaganda. The two major methods of obtaining specific information by survey sampling are the use of questionnaires and personal interviews. The primary purpose of using an interview is to present items of interest personally to the respondent, thereby precluding errors in interpretation, and to obtain replies from other individuals so that generalizations can be made.

Most personal interviews follow a prescribed pattern; both the wording and order of questions are decided upon in advance and rigidly adhered to. A less formal type of interview uses a detailed list of subject matter to be covered. It permits the interviewer to vary the wording and order of subject matter so that the maximum amount of information concerning specific topics can be obtained.

Survey sampling requires personnel trained to collect data, personnel skilled in its interpretation, and accessibility to the target audience.

When the target audience is not reasonably accessible, panels of representatives of the target audience may be used. These may include prisoners of war, refugees, defectors, and other available typical representatives of the potential target audience. Panels must be as closely representative of the target audience as possible. Pretests with such groups can indicate what appeals are likely to be effective, what to emphasize, and what to avoid. By being familiar with the backgrounds of panel members, the results of pretests can be interpreted in the light of differences between respondents and the intended target audience.

Panels of representatives may be configured in a number of ways. A panel may consist of as few as five representatives or as many as a hundred. The guiding consideration is that the number of representatives must be sufficient to provide an adequate cross-section of the intended target audience, and the number of responses must be sufficient to provide a reliable indication of effectiveness.

Pretesting may be done by using the following methods:

Group consultation. This method allows representatives (5 to 15) to observe and study an item of propaganda and exchange views among themselves. It requires the pretester to direct the discussion along prearranged lines to obtain information and preclude extraneous comments. Use of this procedure enables the respondents to exchange ideas; sets the respondents at ease, since they are among peers; and enables the pretester to utilize large numbers of representatives in a relatively short time. The disadvantages are that the respondents may tend to agree with the majority to avoid peer-group criticism. In addition, discussions may become long and extraneous unless carefully controlled. Care must be exercised to assure that comments which are relevant in the sociocultural setting of the respondents are not excluded by overcontrol.

Individual interview. This method allows respondents to observe and study a series of preranked, prearranged items of propaganda. By use of this method, several items of propaganda previously used on actual target audiences are given a decreasing effectiveness rating ranging from very effective, through moderately effective, to not effective. The new item is matched with the prescaled propaganda. The respondents are asked to indicate which items of propaganda material they feel are most effective and why. Choices are compared. If a majority indicate that the new item of propaganda is likely to be more effective on the actual target audience than the prescaled items of propaganda rated "not effective" or "moderately effective," the new item of propaganda may be used.

On the other hand, if a majority of the panel indicate that the new item is not likely to be as effective as the prescaled propaganda rated "not effective" or "moderately effective," the new propaganda material should be revised to conform with panel recommendations. The pretester must determine why each respondent makes his choice.

When using panels of representatives, it is essential that the individual conducting the pretesting give very explicit instructions. Some of the more important points to cover and actions to perform include:

Pretest instructions and actions:

Explain reasons for and the nature of the pretest.

Put the respondent at ease.

Inform the respondent that his identity will remain anonymous, if he desires.

Inform the respondent that his cooperation with the pretest will not affect his status.

Inform the respondent that he should consider himself to be in the status and position of the target audience he represents.

Convince the respondent to answer according to his convictions--that the purpose of the pretest is to identify weak as well as strong points--and explain the reasons.

After the pretest:

Express appreciation for cooperation.

Reaffirm that the respondent understands that he will receive no reward, financial or otherwise, for participating in the pretest.

Reaffirm that the respondent understands that his identity will remain anonymous.

When the target audience, or representative personnel, are not available, panels of experts can be used to pretest propaganda. These individuals, who need not be representative of the target audience, should possess current knowledge and be expert in pertinent areas of knowledge or learning; i.e., order of battle, sociology, politics, communications, etc.

Experts may be located near any PSYOP unit. They may be found in the United States Information Service, United States Agency for International Development, intelligence agencies, business firms, etc. These individuals should be used whenever the need for them arises.

Posttesting

This difficult but essential step in development of propaganda determines the next or new propaganda message. The questions that posttesting must answer are:

What did the propaganda achieve?

Was it effective?

How effective?

Why not totally effective?

What propaganda will achieve total effectiveness?

It is extremely difficult for the psychological operator to measure changes in conduct and intangibles, such as attitudes, opinions, and emotions, upon a physically inaccessible audience. The effects of propaganda upon such an audience may be gleaned from the reaction of the enemy government as determined by its actions and made known by various media. Prisoners of war, defectors, line crossers, and sometimes, press correspondents may assist in the process.

Evaluation of all factors influencing propaganda and the results must be objective. All propaganda must be evaluated on the basis of the results desired and the results achieved, but must be measurable by comparing the results desired with the actual change in conduct, attitudes, opinions, and emotions.

BASIC CHARACTERISTICS OF US ARMY PROPAGANDA

Success in PSYOP is impossible without credibility. Even in the most underdeveloped areas, or under the most adverse conditions, the truth becomes known to a target audience. If lies have been told, credibility is lost. Once lost, it can never be totally regained.

US Army propaganda is based on a strategy of truth. It seeks to strengthen or create a favorable image by emphasizing the credible truth. This is so because the complete truth is frequently not believable (is incredible) to the target audience. For example, in World War II it was incredible to the enemy that the prisoners of war we had captured were receiving regular rations of cigarettes (with tobacco in them), fresh oranges, chocolate bars, coffee, and other items not available to the general populace in enemy countries.

Dedication to the truth does not imply that a full recounting of facts is required or advisable. Facts to support certain themes may be selected while others may be excluded. The propagandist reports those facts that present his side in the best light. However, to maintain objectivity, he may present some views (generally minor) from the other side. This is done, in many cases, to reduce the impact of enemy propaganda and to increase the credibility of US/friendly propaganda, since people tend to believe a source if both sides of a position are presented, even when one side is dominant.

KEYS TO SUCCESSFUL PROPAGANDA

The first requirement for successful propaganda is a national policy that meets the needs of the target audience. The role of the psychological operator is to communicate that policy. Not only must the propaganda be credible and persuasive, it must also not be recognizable by the target audience as being propaganda:

News--commentary--discussion--instructions--facts--entertainment
--YES! Propaganda--NO!

Propaganda must be **based on reality**. Any gap between reality and propaganda will be quickly noticed. It does not require mass communications systems to reveal discrepancies. The jungle drum and the bamboo telegraph will do that quickly enough. With the transistor radio and even television reaching the most primitive areas, the time gap is even shorter.

Messages to different groups of people will vary according to their different interests, but the underlying themes--the substance of the messages--must be **consistent**.

Messages to different audiences may be different, but **never contradictory**. The **credible truth must be consistent to all audiences**.

Propaganda must gain attention--**IMMEDIATELY** open minds. It must be presented so that the target audience will open its mind (individually and collectively) to receive the message. Insults, harassment, and messages degrading the target audience have the unwanted effect of closing the mind.

After the mind is receptive to the message, **it must be held open**. This is done by appealing to the interests of the audience and by presenting better solutions to their problems than those presently available. If possible, the propagandist must create or awaken an awareness in the target audience to needs that only he, the propagandist, can satisfy.

The psychological operator must take into consideration the fact that not only does each target audience have its own specific interests, but these interests have a priority of importance. Propaganda will hold the attention of its target audience only so long as it appeals to the most urgent interests and needs of the audience, and so long as the solutions offered are realistic and safe.

The same factors that apply to overcoming resistance to propaganda also apply to **gaining and holding an audience**. With good propaganda, however, it is easier to gain and hold the attention of a new audience than one that has turned away from previously disseminated material.

The degree to which actions are influenced and the permanency of actions (when free from coercion) measure the success of the message. The most successful propaganda, with the longest effect, is that which **reinforces the actions** brought about by creating favorable opinions, emotions, and attitudes in the target audience. The favorable opinions, emotions, and attitudes give **permanency to the actions**.

ROLE OF THE ENEMY

The psychological operator must always bear in mind that the enemy government, with its civilian and military agencies, has a major effect upon the target audience. This effect places the US/friendly propagandist at a disadvantage which he must overcome. The following factors are of primary importance.

Enemy Control Over Audience

An enemy government generally has physical control over the target audience. This gives it the power and ability to punish those whom it considers to be criminals or nonconformists. Fear of punishment is a major deterrent to actions that the propagandist might desire; e.g., having a target audience listen to his radio broadcasts when listening is punishable by death.

It follows that a government that has physical control over a designated target audience also controls the total welfare of that audience. Aside from incarceration and the power to inflict death, the enemy government has lesser but, nonetheless, highly effective means of interfering with the propagandist trying to reach those within its jurisdiction.

The government might prohibit criminals and nonconformists from working. It can restrict travel, a serious penalty for those who must travel to work but who may be prohibited from doing so by government edict.

Those within the power of an enemy government are aware that their welfare depends upon compliance with the wishes of their government. They will hesitate to jeopardize their well-being and that of their families.

Enemy Interference With Friendly Propaganda

Propaganda does not flow freely into enemy territory. The enemy has the physical power and means to restrict the flow of communications within any territory it controls, even where there is an effective shadow government.

Enemy-Imposed Sanctions and Rewards to Informers

Not only can and will the enemy government impose sanctions upon those who defy its wishes, laws, and edicts, but it will also offer substantial rewards to those who inform on lawbreakers and nonconformists. These rewards may take any number of forms: money, jobs, rank, land, business opportunities, power, fame, etc.

Generally, the fear of being reported is as great as being caught transgressing by police or other security agents. This fear often inhibits individuals, groups, or even societies from freewill actions, such as listening to foreign radio broadcasts and speaking with strangers, nonconformists, or members of outgroups.

Enemy Popular Support

While it may be your enemy, a government or armed force is someone else's friend. The psychological operator who works on the premise that his enemy is everyone's enemy is deceiving himself. Every government has some degree of popular support. It has those who will take the necessary steps to support it. For example, the bureaucracy of government employees has a vested interest in aiding the government that employs it. There are also a great number of people who would fear change, and there are always those who believe in their government, right or wrong. None of these will assist the propagandist. In fact, they probably will actively oppose his efforts.

Enemy Propaganda Campaign

The last, but not least, effective weapon of the enemy will be its own offensive propaganda. This propaganda will strengthen the resolve of those who favor the cause of the enemy and will tend to weaken the resolve of those who are neutral. The enemy's propaganda may require the US/friendly psychological operator to divert time, energy, money, personnel, facilities, and other resources to counter it.

The psychological operator must not downgrade enemy PSYOP efforts; he must be aware that he does not have a monopoly on effective psychological operations and credible persuasive propaganda. **Never underrate your enemy** is as true for psychological operations as it is for combat.

The way to success is not a one-way street. The psychological operator must expect that his successful propaganda efforts will bring about an **enemy counterpropaganda campaign**. The results of the counterpropaganda campaign will depend on the effectiveness of US/friendly efforts. An enemy's irrational overreaction may work to the advantage of the US/friendly propagandist.

While US and friendly military, economic, and political sanctions will lessen the will of some members of the enemy forces to fight or the will of civilians to support their government, these same sanctions may strengthen the will of others to resist our efforts. Our propaganda may incite some members of a selected target audience to greater antagonistic effort.

Authoritarian governments are prone to overact; this may work to the benefit of the US/friendly propagandist. Overaction by blanket prohibition will generally help the US psychological operator. It will lead people who are naturally curious to take risks to satisfy their curiosity.

Prohibition from listening to US/friendly radio broadcasts or watching TV may, in spite of the risks, whet the desire to hear and see what we may have to say or show. Prohibition from reading leaflets, circulars, newspapers, and magazines may lead to a black market in these items.

The propagandist must make the target audience's risks worthwhile by disseminating propaganda that appeals to their needs and interests and helps them alleviate their situation.

If US actions are honorable and humane and its accompanying propaganda credible, acceptance by a few may lead to a bandwagon effect, and hostility may decrease. The effects of a sound, complete message (actions and words) can be contagious.

Resistance to Propaganda

The first step to overcoming resistance to propaganda is to determine the reasons why it is resisted. This may require thorough background research into the history of the target audience whose values, culture, and present conduct have a historical basis. All groups, cultures, and societies have events in their history that are particularly significant and are categorized by key slogans, phrases, events (e.g., Bastille Day in France), and religious ceremonies.

A basic ingredient in overcoming resistance to propaganda is a logical PSYOP plan that is **culturally accurate**. The most detailed PSYOP plan in the world is utterly useless if it is not appropriate to the environment, conditions, and culture of the target. Each target group is susceptible to specific appeals. A plan that considers the uniqueness of its target will, when implemented, more readily overcome resistance by the target audience.

While words may make promises, actions concretely prove intentions. A major role of the psychological operator is to communicate word of the **implementing efforts**.

Everybody likes a winner. This works to the advantage of every psychological operator. Success and victory have a bandwagon effect in that they bring more adherents to the cause. The greater the success or victory, the greater and more assertive the PSYOP campaign should be to **exploit the success or victory**. The uncertain and wavering will join the victorious cause. The ties of the strongest adherents to the losing side will weaken. Good PSYOP enhance the effects of victory and success.

PROPAGANDA LIMITATIONS

The following factors place limitations upon the effectiveness of PSYOP and propaganda:

Political

Political situations and conditions may be such that the aspirations of the target audience cannot be fulfilled. National policy may preclude offering even token fulfillment. Complete agreement among allies is seldom attained on policy affecting their goals, national interests, and courses of action. Conflicting needs of other agencies of government operating abroad and military necessity may make policy uncertain. This may result in courses of action that reduce credibility and good will below the level desired in psychological operations.

Military

The military situation may be adverse, thereby stringently limiting the use of effective propaganda. Even static military situations restrict the possible effectiveness of PSYOP. Military security may limit the use or timing of potentially sound and effective themes and messages.

Audience

Target audiences are suspicious. Under the adverse conditions in which they generally exist, they have every reason to be. Being suspicious, they are not disposed to believe that the propagandist really has their interests at heart, or even that his interests are compatible with theirs. Because of historical, social, cultural, and language differences, the target audiences may not respond to the propagandist's line of reasoning. Because the enemy regime has greater access to the people under its control, it can interpose barriers that will limit or destroy any chance of communication between the propagandist and his intended target audience. In addition to technical communications barriers, extensive political and security police organizations that control communications can impose sanctions on the intended audience.

Personnel

Ultimate success depends upon dedicated, proficient personnel who can do the job. Unfortunately, due to scarcity and great demand, they are frequently not available in time of conflict. Equipment is not a substitute for these people.

COUNTERPROPAGANDA

Counterpropaganda is propaganda directed at the target audiences of enemy propaganda; it is designed to counteract enemy or other foreign propaganda and to capitalize on vulnerabilities in their campaign. Through the use of counterpropaganda, enemy campaigns can be either neutralized or minimized. While counterpropaganda is basically defensive to limit the effectiveness of enemy propaganda, it is not so in a negative sense. Using imagination, a psychological operator can, and should, initiate a well-planned, aggressive, and effective counterpropaganda offensive.

USE OF COUNTERPROPAGANDA

The use of counterpropaganda must be based on intelligence, propaganda analysis, and the answers to the following questions:

How will the counterpropaganda affect the overall PSYOP campaign?

What is the current and potential impact of enemy propaganda?

What is the probability of success of counterpropaganda?

The psychological operator must be aware of the danger of becoming so involved in a counterpropaganda campaign that he loses the initiative.

COUNTERPROPAGANDA TECHNIQUES

The technique used will depend upon the current situation and the possibility of success. Some of the most common techniques are:

Conditioning

This involves the use of education and information programs to condition the target audience and thereby reduce the shock effect of anticipated enemy propaganda. This technique reduces susceptibility.

Forestalling

This technique is akin to "immunization." It is the process of counteracting or capitalizing on a subject potentially exploitable by enemy propaganda before the enemy uses it.

Minimizing the Subject

A subject may be minimized by the following techniques:

- Emphasize its favorable aspects to the target audience.

- Insinuate the entire story cannot be told at present, while suggesting that the full facts will prove the enemy story either inaccurate or totally false.

- Briefly mention the enemy story and drop it.

Direct Refutation

This is a point-by-point rebuttal of enemy propaganda. A danger of direct refutation is that it may, by keeping the subject in the "public eye," add strength and possibly credibility to enemy propaganda. Therefore, care must be taken to counter the enemy's story so completely and effectively that publicity will not give it credibility.

Indirect Refutation

Indirect refutation introduces new, relevant themes which refute the enemy propaganda by implication and insinuation. By using this technique, the psychological operator is less likely to reinforce the credibility of enemy propaganda than if he directly refuted it.

Diversionsary Propaganda

This is an attempt to divert the attention of the target audience from the enemy propaganda by using new themes or by intensified use of themes that have proven effective.

Imitative Deception

This technique involves the alteration of enemy propaganda so as to give it a different slant, a slant favorable to the United States and its allies.

Silence

The best technique may be to ignore the enemy propaganda, particularly when active counterpropaganda measures may be dangerous or the effect is uncertain. In the event that the enemy theme does not lend itself to successful exploitation, or the subject is not important enough to warrant rebuttal, IGNORE IT--REMAIN SILENT! Before using this technique, the effect of silence upon the public must be weighed.

Restrictive Measures

Restrictive measures may be used to deny the target audience access to enemy propaganda. This, however, calls attention to the enemy output and whets the desire to learn the enemy's story. It thereby encourages the target audience to listen to and read the denied propaganda covertly. Restrictive measures, generally used by authoritarian governments, are never completely effective. Total enforced isolation is virtually impossible. Restrictive measures are not recommended.

Chapter Twelve

PSYOP PLANNING

12

The key to the success of PSYOP, as with any military operation, is adequate planning. The need for detailed, long-range imaginative planning is critical.

To be successful a psychological operation requires:

- A complete, detailed, accurate data base arranged for ease of use.
- Detailed, timely intelligence.
- Centralized control.
- Sound and timely planning.
- Decentralized execution.
- Optimum use of available resources.

Themes	12-7
The Message	12-8
Message Structure	12-8

Psychological operations planning is a continuous process requiring imagination and determination. It must be responsive to immediate change brought about by any new condition or circumstance affecting the target audience or the psychological objective. The resulting plan is also subject to change.

The **PSYOP planning process must be flexible**. Targets of opportunity should be exploited as they arise. Opportunities to exploit a vulnerability may be lost by inflexible insistence on implementing the original plan. Vulnerabilities, conditions, target audiences, objectives, and themes often change rapidly due to shifts in events and policies.

Planning may precede or follow the decision to carry out a course of action. Whether the planning precedes or follows the decision, the ingredients are essentially the same for any PSYOP plan. For example, contingency plans follow the same pattern; they cover a variety of situations, such as the end of hostilities, intervention by other nations, the use of new weapons, changes in political conditions, and changes in the military situation. Contingency plans are designed to be implemented immediately upon order when the anticipated and prepared for event occurs.

PLANNING CONSIDERATIONS

Realistic objectives that can be achieved within policy limitation.

Analysis of the existing military and political situation.

Sources of information.

Delineation of the target and its accessibility.

Themes to be used to achieve PSYOP objectives.

Themes to be avoided.

Media to be employed.

Formal staffing and coordination required to effect the plan.

PSYOP PLANNING SEQUENCE

The sequence of steps taken to plan a psychological operation will vary with the situation; however, the same steps apply to any PSYOP planning. The flow and sequence of major PSYOP actions which occur in both PSYOP units and staff sections are shown in figure 12-1 to guide those involved in planning and supervising psychological operations.

As a first step, PSYOP personnel constantly gather information relevant to the area of operations. This intelligence focuses on subjects of PSYOP interest. The material, gathered from numerous sources and analyzed, is placed in a Basic PSYOP Study (BPS). (For a detailed discussion, see chapter 14 and appendix C.)

Target analysis is a major action in campaign development. It is an examination of intelligence to permit the analyst to establish a list of psychological objectives to guide PSYOP personnel in conducting psychological operations. (For a detailed discussion of target analysis, see chapter 14 and appendix F.)

Mission Assignment

A PSYOP support mission can be given to a PSYOP unit at any time during the PSYOP planning sequence prior to the initiation of campaign control. Upon receipt of a PSYOP mission, the PSYOP personnel follow the routine decisionmaking steps outlined in FM 101-5.

PSYOP Estimate of the Situation

The ACofS, G5 is responsible for the preparation of the PSYOP estimate of the situation (appendix D). The commander's decision regarding PSYOP support of the mission is made from this document. The estimate should, above all else, make clear the psychological impact of the commander's proposed courses of action.

Plan Preparation

After the commander announces his decision, the ACoS, G5/S5 prepares plans/annexes tasking the major subordinate elements with the responsibility to accomplish the PSYOP tasks. The same plans provide the commander with sufficient PSYOP support to accomplish the tasks. The PSYOP unit commander makes recommendations for the employment of the PSYOP assets.

Media Selection

Selection of media to transmit messages is based on the information revealed during target analysis. The analysis determines the type of media that is acceptable and credible to the target audience. (See chapter 17 for further discussion.) The planner must also consider the availability and mechanical capability of the media to deliver the message. For example, if television is selected, the audience must have access to compatible receivers. Early in the planning stage, consideration must be given to the time required for production and delivery. The message must be delivered at the needed time.

Propaganda Development

Propaganda development is the process of taking information, knowledge, and material available, visualizing it all, and expressing it as artwork, words, symbols, texts, manuscripts, and actions.

Pretesting

A pretest to determine the probable impact of PSYOP material upon the target audience and unintended audience should be accomplished using the appropriate techniques. The best sounding board for pretesting is a cross section of the target audience. If these people are not available, a panel of those most similar to the target audience should be used. (See chapter 11 for techniques.)

Campaign Control

Campaign control involves the production and dissemination of PSYOP material. For a discussion of campaign control see appendix G.

Posttesting

Posttesting and pretesting techniques are the same, but the same personnel must not be used on both testing procedures. In addition, posttesting discussions must be concerned with the reasons for audience responses.

Feedback

This is the basis for modification of plans and operations.

FIGURE 12-1

PSYCHOLOGICAL OPERATIONS FLOW

IMPROVING THE PRODUCT

Successful propaganda is both credible and persuasive. Building credibility requires consistency and time. Of the many factors entering into the establishment of credibility, one of the most important is an accurate target analysis. Credibility will be enhanced when the themes relate to the needs and wants of the target audience and are kept within their frame of reference. Experience indicates that the persuasiveness of propaganda to a hostile audience is increased when the propaganda is objective and indirect--the more hostile the audience, the more objective and indirect the propaganda.

Personal messages for delivery or transmission to individuals or groups in a target audience by a former associate or relative should contain intimate details known only to the source. They should be a means of identification to the intended audience.

In addition, the source must be clearly identified with sufficient information so there is no doubt as to his identity. This reinforces the credibility of the message.

AVOIDING THE COUNTERPRODUCTIVE

The following statements apply in limited, general, and cold war:

In a foreign internal defense situation, avoid propaganda that places the host country in a secondary position. US Army psychological operations support host country efforts.

Do not use terms, weights, or measures that are foreign to the target audience.

Do not translate directly from English to a foreign language. Instead, give the linguist an idea or concept and have the concept phrased in the local language.

Do not add credence to enemy propaganda through words or actions.

Make definite positive statements. Avoid the negative. Do not appear uncertain.

When preparing messages for dissemination, follow the rule **any statement or action that can be misinterpreted will be misinterpreted**.

Do not distribute propaganda that can be easily altered by the enemy to their advantage.

Avoid themes to which host country and enemy troops are equally vulnerable.

Do not insult or anger the target audience. Keep their minds open and their emotions friendly.

Do not use strong threats. Use threats only to meet or arouse a need, and present them as facts.

Do not give free publicity to enemy atrocities in the host country.

Use enemy atrocities to gain sympathy abroad.

Keep all promises; if uncertain of ability to deliver, don't promise.

Security permitting, warn civilians of impending artillery fires, naval gunfire, and aerial bombardment.

PSYCHOLOGICAL OBJECTIVES

A psychological objective is derived from the mission. It may be a single step or a series of steps designed to lead the target audience toward the behavior or attitude desired to accomplish the PSYOP mission. Changes in conditions may bring about changes in psychological objectives.

Psychological objectives are classified as:

Cohesive. Those whose achievement would strengthen or more closely unite the society or target group.

Divisive. Those designed to separate the individual from his group, separate a group from other groups or a society, or disorganize a group or society.

THEMES

A theme is a subject, topic, or line of persuasion used to achieve psychological objectives by exploiting existing vulnerabilities. Themes are the bridge between propaganda opportunity and the response which the psychological operator is trying to elicit.

Each theme should stand alone. It must, however, be coordinated with all relevant agencies to insure consistency and support for national objectives and policy.

Each theme should deal with only one subject. Do not complicate a theme by trying to achieve several objectives. Use separate themes for each objective.

Themes should be selected to persuade the target audience to adopt the course of action wanted by the psychological operator. The audience is motivated by telling them what action is desired, why it is desirable to them, and then showing how it fulfills their needs. Do not use negative themes to achieve positive action, as they tend to be counterproductive.

Make surrender/defector appeals on safe-conduct passes. Insure that the leaflets on which the appeals are made state that they are safe-conduct passes.

State that surrender may be made without a pass.

Stress that surrender may be made to any unit.

Inform all US/friendly units of the surrender/defection policy, so that those enemy who try to surrender or defect are not shot in the attempt.

Defection and desertion appeals are used to encourage individuals or groups among enemy forces to place personal considerations above group interests. Desertion/defection appeals should give absolute, specific assurance of good treatment, and cite honorable and worthy reasons for desertion or defection. When appropriate, use defectors to criticize their own government and military forces. Their message is personal and will have a greater effect than that of outsiders.

Family appeals are very effective, but should be disseminated in the enemy area only; if they are circulated where friendly troops prevail, they may cause desertion among host country troops.

Explaining the presence of foreign troops in the country is a major task. Items prepared to explain this presence should be pretested extensively to insure they cannot be misinterpreted as boasting. Similarities of culture and national goals between the host country and the US should be stressed. Differences between the host country/allies and the United States should be deemphasized.

THE MESSAGE

A propaganda message is a communication with the purpose of bringing about an action and an attitude. Before it can accomplish its purpose, it must get a hearing by the designated receiver (target). In brief, **a message must be received, be understood, be believed, offer a solution, and bring about a desired result.**

Given a policy, intelligence, a target, themes, and appraisal of the desired results, the propagandist composes his message. He must construct, time, and transmit his message so that, even though in competition with considerable other material being presented to the target, it gets a hearing. The target must understand the message and give it the interpretation intended by the propagandist.

A propaganda message must arouse or stimulate needs. It must cause an action or bring about an attitude desired by the propagandist. This requires that the message tell the target how to satisfy its needs--by following the course of action desired by the propagandist. This, in turn, requires that the actions (urged openly or implied) be appropriate and important to the target. In order to get the action or attitude desired, the message must, in the opinion of the target, offer the best solution (or the only logical one) toward solving the problem addressed or in fulfilling target needs.

In essence, the propagandist must take all necessary steps to assure that the action he desires will succeed and that the action he does not desire will have the least opportunity to appeal to the target; i.e., that the undesired action will fail.

MESSAGE STRUCTURE

The propaganda message should be clear, concise, and coherent--a precise item without extraneous material; everything in it must contribute to the whole message, providing a coherent flow without the use of filler material.

In preparing a message or line of persuasion, avoid abstractions if possible. Make maximum use of specific and factual examples and photographs.

If abstractions are used, define them in the simplest terms.

Relate the message to the everyday life of the audience.

Since the target is suspicious and will look for hidden unfavorable meanings, insure that only one interpretation, the intended one, can be given each sentence.

Since the target has a different background and frame of reference, do not use unfamiliar idiomatic expressions or jargon.

Use clear and complete statements.

Develop thoughts in the logical sequence of the language used by the target audience. Do not leave any thoughts for the target to fill in. The key question to ask is, "Does the audience understand what it means?"

Use the level of language that is correct for the literacy level of the target audience. For semiliterates, it is best to use their regional dialects and idiomatic expressions.

Chapter Thirteen

13

CONCEPT OF EMPLOYMENT

In war, the side which most effectively influences the psyche of man will have the strategic advantage, fight the better fight, and win the victory and the peace.

ROLE OF PSYCHOLOGICAL OPERATIONS

Psychological operations are interrelated with national, ideological, economic, foreign, and military activities. They establish, maintain, and reinforce the effect and credibility of these integrated functions. Concerted, systematic, and comprehensive psychological programs support US military services and the government agencies and departments concerned with national security.

US ARMY PSYCHOLOGICAL OPERATIONS

PSYOP personnel support and complement planned operations. They also assure that the psychological impact of planned and executed operations and military activities are made known to the commander. These might include stationing of forces, deployments, official and personal troop expenditures and conduct, and storage of munitions and weapons.

PSYOP are aimed at three major foreign target groups:

Enemy

Psychological operations attempt to demoralize the enemy soldier or hostile civilian, undermine his cause, obtain favorable behavior, and develop opinions, emotions, and attitudes to reinforce that behavior.

Uncommitted

Psychological operations must develop favorable behavior in the uncommitted and reinforce favorable opinions, emotions, and attitudes.

Friends

Psychological operations must keep friendly groups and individuals assured of the eventual victory.

NATIONAL OBJECTIVES ABROAD

In the area of foreign policy, psychological operations may have the mission of supporting political objectives, gaining support and cooperation of neutral countries, strengthening or weakening alliances, deterring nations from aggression, and bringing about the final surrender of the enemy.

MAJOR MILITARY OBJECTIVES

Joined with the persuasive psychological pressures generated by combat situations, PSYOP can help to lower enemy morale, reduce combat efficiency, encourage defection and desertion, participate in deception operations, and add a multiplier effect to existing forces to bring about more efficient accomplishment of the mission.

Lower Enemy Morale

Sustained use of PSYOP stressing unfair treatment of ethnic, economic, social, political, and regional groups or minorities can produce a divisive and depressing effect upon the morale of enemy units and the civilian population. Exploitation of a deteriorating enemy military and political situation can also accomplish this.

Reduce Combat Efficiency

Steady psychological attacks upon morale, integrated with other military operations, can lower the combat effectiveness of enemy troops. This may be done by emphasizing the growing strength of allied forces, the lower civilian morale, enemy combat defeats, and destruction of enemy industrial capacity.

Encourage Defection and Desertion

Enemy soldiers subjected to psychological operations over extended periods can be induced to malingering, desert, defect, fail to perform their duties effectively, fight dispiritedly, and surrender.

Deceive

PSYOP can support tactical deception plans of the commander; e.g., convey deceptive information. But no deceptions which are contrary to the law of war (e.g., broadcasting falsely that an armistice or cease-fire has been agreed upon) will be conducted. Use of deceptive information requires that subsequent effects on the future credibility of PSYOP information be carefully considered.

These objectives are attained by propaganda and deliberate actions with planned psychological impact. Any means of communication may be used to deliver the message. Whether used singly or combined, the entire communications effort must be centrally coordinated and integrated. Messages may be transmitted overtly or covertly.

LIMITATIONS

The psychological operator must be aware of and overcome the limitations of PSYOP. These include:

Enemy Countermeasures

The effectiveness of PSYOP is limited by the enemy's ability to use political and military sanctions against people within its territory and its ability to intercept

communications, emanating both within and beyond its boundaries, aimed at people within its territory. Enemy counterpropaganda will also act as a damper against US/friendly psychological operations.

Incomplete Information

Lack of or incomplete information will limit the number of vulnerable targets.

Difficulty Evaluating Effects of Own Propaganda

Stringent enemy restrictions on news, public discussions, and travel limit accurate assessment of US/friendly PSYOP efforts.

Lack of Coordination

A lack of planning and operating coordination between military units, headquarters, and services and between civilian and military agencies will limit and adversely affect US/friendly PSYOP.

Lack of Qualified Personnel

Effective PSYOP require dedicated, imaginative people who know the language and customs of the target audience and are familiar with the political, economic, social, psychological, and ideological conditions of their society. Such people are scarce.

Law of War

The psychological operator is limited in his actions and words by the proscriptions (listed in FM 27-10) of the laws of war set forth in the Hague Conventions, Hague Regulations, and Geneva Conventions of 1949, and other sources. These proscriptions constrain the actions of the United States in conflict situations and must be observed by US military personnel.

MAJOR OPERATIONAL CONSIDERATIONS IN STRUCTURING A PSYOP FORCE

MISSION

The PSYOP mission is derived from that of the supported force; therefore, the mission of the supported force is the major factor in structuring a PSYOP force.

Realistic appraisals must be made of PSYOP capabilities within the limits of national policy and command directives, and available personnel and material resources. The ability to plan and execute a PSYOP campaign may be limited by a number of factors, such as:

- US/friendly nation national policy.

- The realities of unit, service, or agency priorities.

- United States vis-a-vis friendly nation priorities.

- Deficiencies in number and quality of personnel.

- Lack of and deficiencies in material resources: facilities, equipment, parts, and supplies.

TARGETS

The primary targets of PSYOP are groups: political, social, economic, cultural, ethnic, racial, religious, military, intellectual elites, farmers, laborers, government employees, white collar workers, etc. But knowing your target is not enough; the type of media through which the target audience can be influenced must also be known.

Accessibility of the target will determine the type of campaign to be implemented and the propaganda mix. The major factors determining target accessibility are political, geographic, literacy rate, and communications media available to the source and to the target. These factors play a key role in determining the type campaign to be implemented and the media mix.

MEDIA

Among the major factors determining the proper media mix are the present or anticipated political situation, geographic restraints, the literacy rate, and the availability of a particular medium. National sovereignty, national policy, international relations, the location of the target within political boundaries, and whether the target is under US, friendly, enemy, or neutral political control must be considered.

The geographic area of operations is as important in planning and executing a psychological operation as it is for all other operations. The location, climate, physical features (large bodies of water, high mountains, extensive desert, swampland, vast plateaus, low mountain ranges, great prairies, etc.) not only determine the type of propaganda that can be disseminated and the means, but, more important, the type, density, and availability of target audiences.

The psychological operator must keep in mind that within a geographic or political area, the literacy rate of target groups may vary from almost complete illiteracy to complete literacy. The literacy rate of the target audience will determine whether printed material should be distributed, and, if so, what type. It will determine the type of radio, television, audiovisual, and theatrical programs to be presented as well as the level and type of interpersonal (face-to-face) communications.

While the most effective medium is face-to-face communication, major reliance must be placed upon use of mass media in PSYOP campaigns. Logistical considerations and message authenticity and credibility force the PSYOP planner and operator to look to "on-the-ground" facilities, equipment, personnel, and supplies.

Use of local media: Policy, agreements, and legal contracts must permit the use of local mass media resources, and funds must be available to obtain their use.

Except for normal business agreements and contracts, use of local mass media resources in foreign areas requires joint US/HC approval. Legal clearances must be obtained before planning for, or attempting to use, local media.

Availability of receiving equipment: Two of the major mass media, radio and television, require both transmitting and compatible receiving equipment.

It is not enough to know that radio and television equipment are available (and perhaps in widespread use). The planner and operator must also know whether they are compatible with his transmitting equipment. He must know whether the equipment in the hands of the target will receive the message. For example, radio communications

may be under strict, closely policed government control, which limits radio receivers to a single government channel. It may not be feasible nor economical to slide into this channel. Thus, radio cannot be used.

Television: Throughout the world, there are several television transmission systems requiring specifically designed receivers: the receivers compatible with one particular system are not compatible with others.

LOGISTICS

Use of locally available supplies not only lends authenticity to propaganda, but also alleviates the logistical burden of transoceanic or transcontinental shipment. The best sources for locating local material are indigenous people who have worked in the communications field. US and host government and private personnel and agencies can render great service in locating facilities, equipment, and supplies.

In an overseas operation, the breakdown of a simple part may put a vital piece of equipment out of operation for months. If locally produced equipment is used, parts are usually readily available for installation, thus reducing the downtime. Maintenance is always a factor in using complex mass media equipment. Use of locally manufactured equipment that can be readily repaired by indigenous mechanics who have been factory or dealer trained simplifies maintenance problems and eliminates the costly, nonproductive process of training local mechanics to repair unfamiliar US-produced equipment.

CONTROL

The missions and location (geographic spread) of supported units must be considered in determining the management responsibilities of PSYOP command and control personnel. Supported forces may be so widely spread out that additional PSYOP command and control personnel are required. Due to the nature of PSYOP management (central policy guidance with decentralized execution), the span of control must not be strained. An overly wide span of control can result in an uncoordinated policy that is counterproductive to psychological operations.

LANGUAGE

Spoken and written languages must be authentic. The final product of propaganda reaches the target as language, written or spoken. It is not enough that the language be scholastically accurate. It must also be currently authentic for each target group. This is particularly true of dialects. The target subconsciously weighs the language used; if it isn't authentic, the message fails.

FOREIGN NATIONAL AUGMENTATION

Augmentation is the rule rather than the exception. The US soldier who can get the message across to a foreign target audience is a rarity. Communications, even between people having a common language, heritage, and way of life, are less than perfect. The problems of communicating are compounded in intercultural communications with differing basic concepts of time, divergent core values and objectives, and different interpretations of phenomena and meanings of words. The job can best be done by local nationals or persons formerly resident in a target area (or among a target group) long enough to acquire the cultural traits of the target.

Knowing the language of the target audience does not mean a person has a thorough understanding of the target. For effective PSYOP, the psychological operator must have complete empathy with and be totally immersed into the total current environment (life) of his target audience. His background must enable him, intellectually, emotionally, and culturally, to visualize the circumstances of the target audience from their point of view, situation, and condition. He must know what is most important to the target audience at the particular time his message reaches them. **He must know his target thoroughly.**

The spectrum of requirements for foreign personnel augmentation ranges from idea men, researchers, writers, professional communicators, administrators, artists, and announcers, through translators/interpreters, technicians, artisans, and skilled personnel, to maintenance and service personnel, skilled, semiskilled, and unskilled workers. It may be difficult to find a sufficient number or any persons who have the required education, ability, expertise or skills to meet the needs of the unit. One possible means of overcoming this deficiency is to break the requirement or job into simple components as is done on industrial mass production lines.

Foreign social scientists required to learn the psychological characteristics of a target audience may be unavailable. In this case, empirical observations may be taken from policemen, reporters, political figures (mayors, village or tribal chiefs, etc.), doctors and other healers (shamans, witch doctors, nature healers, etc.). Use of this technique enables the psychological operator to meet a practical need by practical means, with realistic feedback having a practical use.

The idea man must have an intimate, firsthand knowledge of the target people. He must project himself into the target area. He should be well educated by practical experience and background. If he does not have a better than normal education, he must be well read and have an intimate contact with a broad spectrum of the target. Above all, he must know how to put ideas into words, symbols, pictures, and action. In addition:

He must know how to write.

He must be able to make people react.

He must anticipate the reactions of his target.

He must be politically aware.

He must be fluent in the language or dialect of the people.

He must have empathy with the target.

FOREIGN PERSONNEL AVAILABLE

There are three basic sources of foreign personnel:

Local hire.

The majority of foreign personnel employed will be locally hired civilians.

Seconded government personnel.

Another source will be host country government employees whom the host country makes available for use.

Host country military personnel.

A third, excellent source is indigenous military personnel. These individuals who may function across the entire spectrum of PSYOP skills can be more readily deployed and be used in more dangerous areas than civilians.

Another source of foreign personnel is third country nationals. Use of these people may be limited because of potential friction with host country nationals and possible legal problems. They may be limited to a few otherwise unobtainable experts and used for only short periods. In some cases, third country personnel could be nationals of close allies of the host country, and their use would thus pose no particular problem.

Authorization for use of host country personnel is generally proscribed in US/HC agreements and by theater directives. The agreements and directives spell out the precise details of employment--how, when, and where the personnel may be used; wages, bonuses, and other compensation; vacations, leaves, health, and fringe benefits; meals and other privileges; and termination compensation.

ROLE OF FOREIGN PERSONNEL

Almost all propaganda material will filter through the foreign augmentation personnel--from the raw material received as unprocessed information, through the processing stage, to final dissemination and presentation to the target audience--whether as propaganda acts or deeds, interpersonal communications, audio, visual, audiovisual, or printed propaganda.

This is true throughout the entire spectrum of conflict and psychological activities--in pursuit of strategic or tactical objectives; in consolidation operations, FID, UW, or PW operations; or in advisory, training, and assistance missions.

Security Clearances

Ideally and normally, foreign augmentation personnel must be investigated and cleared by appropriate host country and US security agencies. (This is also by US/HC agreement.) Circumstances may arise, however, when personnel may be hired who do not have the desired personnel clearance. The US psychological operator must be aware of the security requirements and procedures and must adhere to the letter and spirit of directives and regulations covering this facet of his responsibilities.

Allegiance of Foreign Personnel

Foreign augmentation personnel owe primary allegiance to their own country, political entity, region, ethnic group, culture, and self-interest. Such allegiance will undoubtedly take precedence over that given to the United States. Normally, allegiance to the United States will extend to those areas and to the extent that the US interests coincide with those to which the foreign personnel give primary allegiance. This may best be summarized by a statement of a foreign employee: "... after all, you Americans must realize that I must live and work here after you are long gone."

Conversely, some local augmentation personnel take on a US orientation (coloring), identifying primarily with their US employer. In so doing, they lose their local perspective (so vital to the success of the operation), perceiving the local target audience from a pseudo-US point of view. The work of such personnel loses its original, essential authenticity and accuracy. This situation sometimes cannot be avoided, and it is difficult for the person(s) having assumed this point of view to regain their original perceptions. Members of host country minorities and of outgroups are particularly prone to this type of identification.

A third, not uncommon, situation is that in which foreign augmentation personnel attempt to "please" the US Army psychological operator, by producing work or a propaganda product which they believe he desires, regardless of its authenticity, accuracy, or potential effectiveness.

Constant Evaluation Required

Because of the problems inherent in intercultural production of propaganda, and the absolute need for authenticity and accuracy, the work of foreign augmentation personnel requires continuous, objective evaluation and cross checking. This must be done to assure that themes are appropriate, symbols correctly interpreted, cultural and social factors accurately evaluated and placed in proper perspective, and that messages are relevant to the interests and frames of reference of the target audience and the psychological objectives.

Duties and Responsibilities of US Personnel

The use of foreign augmentation personnel in the most sensitive and important positions and duties, and in the most menial, does not relieve the US Army psychological operator of any of his supervisory responsibilities or duties; of his responsibilities for assigned tasks, objectives, or missions; nor of his security responsibilities.

On-the-Job Training

Among the major responsibilities, and one whose fulfillment will pay great dividends, is that of implementing an on-the-job training program for local employees. Not only does it build esprit de corps, but it also results in greater efficiency, a better product, and less downtime equipment. It builds a cohesive organization that gets the job done.

*Chapter Fourteen***INTELLIGENCE FOR PSYOP****14**

Effective psychological operations are dependent on the availability of timely, continuous, accurate, detailed intelligence at all levels of command. Only with timely, accurate intelligence can target audiences be identified and analyzed, effective PSYOP campaigns implemented, and persuasive messages prepared and disseminated. The major areas of intelligence activities in support of psychological operations are:

- Research
- Target Analysis
- Propaganda Analysis
- Effects Analysis

Improperly conducted intelligence activities can cause PSYOP campaigns to fail. Target groups may be incorrectly identified, vulnerabilities not properly perceived, inappropriate themes selected, incorrect media chosen, and improper dissemination techniques used.

TYPES OF INTELLIGENCE FOR PSYOP

PSYOP require information concerning or affecting the attitudes and behavior of any target group, military or civilian. This includes information on the social, political, economic, psychological, and ideological environment within the target area. PSYOP have the same combat intelligence requirements as other elements of the force.

CATEGORIES

Intelligence required by PSYOP is divided into two categories: area, special, and basic PSYOP studies; and current data.

Area, Special, and Basic PSYOP Studies: The area, special, and basic psychological operations studies of countries represent an established data base.

Area studies are descriptive in nature and are written for the specific purposes of the proponent agency (e.g., unconventional warfare, civil affairs, etc.). They are usually updated periodically.

Special studies are conducted in response to special requirements and generally contain information of greater depth than other studies. By focusing on one aspect of a country or society, special studies can identify communications patterns and potential target groups, and may contain indicators of the effectiveness of previous PSYOP. They are usually updated on an as-needed basis.

Basic PSYOP studies (BPS) are oriented toward issues of PSYOP relevancy in given countries or areas. They are updated periodically according to priorities established by JCS. A basic PSYOP study, in conjunction with the National PSYOP Policy, is then used as a basis for tactical PSYOP programs. Potential target groups are identified in the BPS.

Current data is used to analyze and select specific target audiences and to determine their susceptibilities. Current tactical intelligence is the information needed to conduct day-to-day operations successfully. It is used to:

- Determine PSYOP essential elements of information (EEI) and other intelligence requirements (OIR) which will later become part of the overall collection plan in conjunction with the operational plans and needs of the supported commander.

- Select themes.

- Provide a basis for developing messages.

- Supplement and amplify existing background data to pinpoint vulnerabilities.

The intelligence required to conduct PSYOP is generally obtained from **unclassified** material. Most of it comes from newspapers, magazines, books, academic journals, studies, and foreign broadcasts. Information obtained through military channels is often classified, not because of the sensitive nature of the material but to protect sources or to conceal the fact that military intelligence personnel are interested in certain unclassified, easily obtained information.

Most of the information in intelligence reports classified for the latter two reasons can be found in unclassified references, and these references should be used as much as possible. Although classified information cannot be used, it is useful as background and reference material.

THE INTELLIGENCE PROCESS

The intelligence process is generally the same for PSYOP as for any other activity requiring intelligence data. PSYOP intelligence needs are integrated into the intelligence efforts of the command by the staff intelligence officer (G2/S2). The PSYOP staff officer and PSYOP units use established intelligence channels to obtain intelligence. They also collect information for the command.

A PSYOP unit has an organic research and analysis (R&A) section to process information. It also collects intelligence during operations when teams are engaged in face-to-face communications. **There is no fixed PSYOP organization to collect intelligence.**

For PSYOP to be effective, qualified PSYOP and intelligence personnel must work together as a team. Individuals with a social science or political science background are ideal; however, training and experience are often more important than educational background.

PSYOP ESTIMATE OF THE SITUATION

Intelligence is needed to form a realistic PSYOP estimate of the situation. This document (or thought process) is designed to determine the best course of action. The estimate of the situation is the end product of the R&A process. It gives a current picture of potential vulnerabilities, susceptibilities, and the psychological impact of the proposed courses of action. The estimate may be written or presented orally. It is normally prepared after receipt of the commander's mission and is based on the commander's planning guidance.

The PSYOP estimate of the situation is valid only for the specific area for which it is prepared.

Since conditions change with events and time, it must be continuously updated as changes occur. Also, different estimates will be needed for operations in different areas. (See appendix D.)

DIFFERENCES BETWEEN THE BASIC PSYOP STUDY AND THE ESTIMATE OF THE SITUATION

The Basic PSYOP Study

The BPS is a detailed background document which describes the PSYOP-relevant vulnerabilities, characteristics, insights, and opportunities that are known about a country susceptible to exploitation. It contains all known political, social, military, and economic factors relevant to PSYOP, the psychological implications, and possible ramifications. It provides sufficient information on a country to prepare and conduct a PSYOP campaign. It is a source document for preparation of the estimate.

The PSYOP Estimate of the Situation

The PSYOP estimate of the situation portrays the current situation in the target country and considers any specific tactical mission or planning guidance.

ORGANIZATION TO SUPPORT PSYOP

To perform adequately the intelligence research and analysis functions required to conduct PSYOP, the intelligence personnel assigned to PSYOP units should be functionally organized. A suggested type organization could include:

Research desks, each staffed by one or more people, with primary responsibilities for areas or regions. Activities include propaganda analysis, preparation of BPSs, target analysis, and furnishing information to support media output. Desk personnel should perform quantitative and qualitative propaganda analysis and establish research files.

An Effects Analysis Section, which is generally concerned with analyzing the effects of US PSYOP on the enemy. It may also be concerned with the effects of enemy PSYOP. Some specific duties should include pretesting and posttesting, review of intelligence reports for signs of enemy reaction to US PSYOP, analysis of captured directives and documents, and the conduct of attitude surveys.

An Editorial and Production Section, which prepares PSYOP material for printing.

A Collection and Publication Section is recommended. It would function as a reference library and distribution center, acquiring, storing, routing, and disseminating all documents in the unit.

ESSENTIAL ELEMENTS OF INFORMATION (EEI) AND OTHER INTELLIGENCE REQUIREMENTS (OIR)

(See FM 30-5)

Essential elements of information are the critical items of information regarding the enemy and his environment needed by the commander by a particular time to relate to other available information and intelligence in order to assist him in reaching a decision.

Essential elements of information consist of a series of specific and pointed questions designed to get the information needed on target groups. These questions should cover the basic psychological, sociological, politicomilitary, and economic environment of the area and target, such as:

Attitude of target toward present situation.

Complaints.

Ethnic origin.

Frustrations.

Languages used.

Problems.

Tensions.

These are just a few of the areas about which definite information must be obtained before the vulnerabilities and susceptibilities of the target group can be determined.

Other intelligence requirements derive from command requirements which do not qualify as EEI and from staff requirements. OIR consist of information (other than EEI) on other capabilities, vulnerabilities, and characteristics of the area of operations which may affect the accomplishment of the mission.

Many of the EEI and OIR are of a recurring type, even though the subject (target group) may vary. The areas above can and should be broken down into subelements when developing EEI and OIR.

The intelligence officer developing the requirements should not assume that the collectors know the situation and what information to seek. For example, the EEI/OIR needed on a hostile civilian population will differ from the EEI/OIR needed on enemy troops. The requirements should be explained as clearly as possible and coordinated with other sections involved. Coordination should be effected with the PSYOP sections involved in planning operations, preparing and disseminating media, and developing PSYOP campaigns, to insure that their information needs are included. (For formulation of EEI and OIR, see p. 4-1, para 4-2; p. 4-2, para 4-5; and index, FM 30-5.)

Vulnerabilities and susceptibilities of the target are identified from target analysis, which is a combination of information gained from the EEI, OIR, and R&A.

Vulnerability

A vulnerability is a condition which can be exploited by the psychological operator. Vulnerabilities can be developed from either strengths or weaknesses. They exist within friendly, enemy, and neutral targets. They may be based upon situational or cultural factors.

Susceptibility

Susceptibility is the degree to which the target can be influenced to follow the course of action desired by the psychological operator. Susceptibilities determine the lines of persuasion (themes) which can be used to influence the target. Susceptibilities are determined through the use of intelligence, information, and objective reasoning.

If susceptibilities and vulnerabilities are not properly assessed and identified, themes (the basis of successful PSYOP campaigns) will be inappropriate to the target audience, resulting in inappropriate, ineffective campaigns.

Using all of the above properly, intelligence personnel must develop and recommend specific themes that will have the desired effect on the target groups. Themes must conform to US PSYOP policy and be timely, consistent, and credible. Appropriate symbols (visuals signs or objects used to convey a message or idea) increase the impact of themes.

The decisions on the media and techniques to be used will be based on the initial research and the intelligence gathered. Media development and dissemination are discussed in chapters 17 and 18.

INTELLIGENCE ACTIVITIES

Basic Psychological Operations Study (BPS)

The BPS, a basic source of valuable information, is a systematic description of the factors that affect PSYOP in a country. The format and guidance on what to include in a BPS are presented in appendix C.

When either reading or writing a BPS, certain terms pertaining to the BPS must be kept in mind:

Relevant event. An observed behavior of a type which can be described in terms of "who does what to or with whom." It has implications affecting the behavior of a large segment of the country's population or the political system. A relevant event has five essential components: an actor, a target, some activity, an issue area, and time. It does not ordinarily, by itself, constitute an issue.

Relevant issue. A highly emotional issue, deeply rooted in the country's history, customs, fears, and foreign policy, which, under certain circumstances, could cause either change or resistance to change in the population or political system.

Relevant data. Events of importance to large segments of the population because they are sources of conflict.

Intelligence Analysis

Collected information must be analyzed before it is intelligence. The analytic process relies heavily on mechanical devices and quantitative techniques so that all information on related subjects can be identified and compared. Some frequently used aids are charts, maps, tables, periodic digests, cataloging, and filing systems.

Completeness and standardization are essential because the collected information must be categorized and carefully evaluated against other related information. Each piece of information is scrutinized to determine its relationship to the whole picture and the extent to which each bit of information confirms, supplements, or contradicts others. If the analyst has any doubts about the truth or relevance of any information or reports, he should state these doubts clearly. No analyst will ever write a perfect report, completely accurate and unbiased. To make allowance for human error, as many independent reports as possible should be gathered on each item to either confirm or deny its probability.

In interpreting information, an analyst must always consider:

What is the relationship of this information to what is already known?

Does it alter, confirm, refute, or add to the information previously received?

Does it tend to confirm or refute the existing estimate of the enemy situation?

Target Analysis

Target analysis supports the development of PSYOP estimates, plans, orders, and directives. It is covered in detail on page 14-10.

Propaganda Analysis

Propaganda analysis supplements the more conventional forms of intelligence. It is valuable because it indicates conditions or attitudes that exist within an area of operations. Conclusions based on propaganda analysis should be checked out by other intelligence methods before being fully accepted. See chapter 16 for a detailed study of propaganda analysis.

THE RELATIONSHIP OF THE PSYOP INTELLIGENCE OFFICER WITH THE INTELLIGENCE STAFF OFFICER, G2/S2.

Since PSYOP is a user and producer of intelligence, the PSYOP intelligence officer must work closely with the G2/S2 both in collecting intelligence for the command and in acquiring data which specifically support EEI and OIR of PSYOP interest.

Some PSYOP abilities and factors that the commander and his staff must be aware of and take into account while planning their operations are:

The ability of PSYOP personnel to forecast situations which may be exploited by either US and friendly forces or by the enemy. If a proposed course of action will create a situation or event that could serve as the theme for an enemy propaganda campaign, the commander and his staff must be aware of this before they make a decision.

The ability to explain US objectives, goals, and policies to the enemy and to hostile civilians.

The ability to contribute knowledge of the psychological vulnerabilities of enemy units and populations to meet order of battle, combat, and strategic requirements.

Some specific tasks which can be levied upon PSYOP in support of intelligence operations are:

Determine if war weariness exists among the military and civilian population, and, if so, how to exploit it.

Identify and exploit enemy mistakes with propaganda.

Find PSYOP opportunities to support the command.

Identify enemy propaganda, its approaches and themes.

Identify differences and hostilities in enemy groups.

Determine how to overcome the effects of enemy indoctrination.

SOURCES OF INFORMATION AND INTELLIGENCE

Intelligence Collection Requirements (ICR)

Information and intelligence needed on a continuous basis, over a long period of time, can be designated as an intelligence collection requirement (ICR) to be automatically added to

all future collection plans and sent to collection elements. Unless a specific termination date or event is given, this will continue until the ICR is cancelled by the originator.

Interagency Document Request

The Interagency Document Request, DD Form 1142, is a convenient and common way to request information or intelligence, in documentary form, from components of the US Government. When this form is used to request classified information, it is sent through intelligence channels for proper validation and transmittal. This is done to give higher intelligence authorities a means to keep aware of intelligence and information requests from lower level units. If the requested document is not held in a repository at a lower level, the DD Form 1142 will go to the Defense Intelligence Agency (DIA) library. A PSYOP unit must have a DIA customer number before such a request will be honored. The Interagency Document Request must cite the particular document wanted and length of time wanted.

DIA Dissemination Center

The DIA Dissemination Center mails documentary materials directly to its customers. Materials are accumulated according to the stated subject interest and periodically mailed directly to DIA customers. All DOD components conducting or involved in intelligence research and analysis, collection, processing, and storage are entitled to become customers of the DIA and to be mailed documents that meet their interests.

Need for Specific Information

If a specific item of factual information is needed and not available, the PSYOP unit may fill out an Intelligence Collection Requirement form, DD Form 1365, in accordance with DIA Instruction 58-1. This request must go through the staff intelligence officer and through intelligence channels to an approving official. The ICR will then go to all those intelligence collection agencies able to collect such information. This is a time-consuming process appropriate only for information of strategic value.

In all dealings with the intelligence community, PSYOP personnel must realize that intelligence is collected on a combat priority basis, and generally, PSYOP is not given the highest priority. For this reason, documentary information obtained from the intelligence community on issues of interest to PSYOP may be incomplete or perhaps nonexistent.

Written and Human Intelligence

The PSYOP researcher can evaluate and determine the current issues of primary concern to the target from newspapers and magazines. Since they are published regularly, changes in attitudes and issues can be recognized and incorporated into propaganda campaigns.

Bibliographies, such as the Reader's Guide to Periodical Literature and Public Affairs Index, list articles appearing in magazines and other publications. For a current topic, or for one with depth in time, the researcher can use these bibliographies to compile a list of publications on a particular subject. Some publishers issue bibliographies which deal only with one publication. For example, the New York Times Index permits the researcher to search out and locate articles on a particular topic that have appeared in the New York Times.

Captured documents, official and unofficial, are a good source of information on enemy plans, weaknesses, policies, and needs. Official documents are plans, orders, maps, manuals, government studies, and other such items. Unofficial documents include diaries, pictures, and personal letters.

PSYOP personnel conduct interviews and interrogations to obtain information peculiar to PSYOP.

Prisoners-of-war and defectors are normally able to provide information on the attitudes and conditions within their units. This includes such information as the quality of leadership, personnel policies, disciplinary problems, medical conditions, and other facts and opinions which can be used in PSYOP planning. It is important that the PSYOP interrogator has early, direct access to these individuals (the interrogees). If possible, it is best to sit in with the intelligence interrogator during his briefing. This saves time since the intelligence man will be interested in many of the same areas as the PSYOP interrogator.

Refugees can give a grass roots view on conditions and attitudes of the populace and the area they come from.

Civil administrators, aware of the needs and attitudes of the people for whom they are responsible, can give information on the plans and means to solve local problems and can identify problems which have not yet been solved.

Civil and paramilitary police are knowledgeable of the area, its people, their habits, political leanings, and every aspect of community activities.

Liaison

Liaison with agencies and groups outside of the Department of Defense to make them aware of PSYOP information needs often can produce much needed information. Some agencies which can assist PSYOP in obtaining information about local conditions and the situation in a target area, or among target groups, are:

- Treasury Department
- Federal Bureau of Investigation
- Central Intelligence Agency
- Political Section, US Embassies
- International Communication Agency
- US Agency for International Development
- Drug Enforcement Administration
- Foreign Broadcast Information Service
- Library of Congress
- Publication Procurement Officers

PSYOP AUTOMATED MANAGEMENT INFORMATION SYSTEM (PAMIS)

PAMIS is covered in chapter 15. It is a source of information which can be used in PSYOP for

various purposes. It can help the PSYOP unit to:

- Prepare PSYOP estimates.
- Prepare PSYOP annexes.
- Analyze enemy target groups.
- Identify enemy vulnerabilities.
- Analyze media from the target area.
- Analyze propaganda received from friendly areas.
- Insure propaganda appropriate to the target.
- Prepare Basic PSYOP Studies.

TARGET ANALYSIS

Target analysis is a detailed and systematic examination of processed intelligence to identify and locate target audiences, identify conditions, pinpoint vulnerabilities, establish objectives, and obtain pertinent information to guide PSYOP personnel. It is the basis for the development of PSYOP estimates, plans, orders, directives, and campaigns. It is also the basis for selection of themes, symbols, and media and for the development of persuasive messages.

Identification and Location of Target Audiences

The initial step which is undertaken by the research and analysis teams is the identification of tentative target audiences. After selection, each one is systematically examined to determine its suitability. This profiling of each target is the core of the target analysis process.

To aid the analyst in identifying and locating potential target audiences, a general guideline has been established:

Target audiences are collections of people who share the same predispositions, which, when successfully manipulated, will lead to the accomplishment of the desired psychological objective.

Of particular importance is the phrase "share the same predispositions." For PSYOP purposes, target audiences are classified as groups, categories, and aggregates.

Groups. Groups are the preferred target audience because they normally are functional, with members bound together by common activities and goals. Since there is a specific reason for its existence, the group can be studied more precisely than any other collection of people. Moreover, more valid and definitive statements can be made concerning group conditions and attitudes.

Categories. Often it will be necessary to direct persuasive communications to large collections of people not classified as groups. To satisfy this requirement, the target analyst may identify a category as a target audience. Unlike groups, members of categories have no clearly definable reason for gathering and normally would carry on no personal interchange, thus limiting the persuasion possibility.

When studying categories, the analyst may find only very tenuous common interests, such as economic, education, social mobility, and ethnic identity among the members. Therefore, information obtained about categories will be more general than that obtained about groups.

Aggregates. A collection of individuals identified by a common geographic location may also be used as a PSYOP target audience.

Possible Results of Persuasive Communications

Persuasive communications should cause the members of a category or aggregate to form common points of reference. Should these people develop sufficient interest, however, they will technically become a group. As a group, this assortment of people will make a better PSYOP target.

As a general rule, the target analyst should attempt to analyze both categories and aggregates precisely by seeking to identify primary and secondary groups within each collection.

Selection of target audiences. Target analysis is conducted to determine if each tentative target is susceptible and will be effective in the achievement of specific psychological objectives. Even though several target audiences may be vulnerable, they may not be equally susceptible and effective in this respect.

Target analysis worksheet. To assist in deriving specific and useful information for the conduct of PSYOP, a systematic procedure has been devised. This procedure calls for the use of the target analysis worksheet (appendix F). The worksheet is a guide for systematically analyzing data relative to tentative targets: the national objective, mission, target audience, target conditions, attitudes, susceptibility, psychological objective, target effectiveness, and impact indicators.

The national objective is obtained from US policy statements and documents. Sources for US objectives relevant to US Army PSYOP might be unified command military plans, ICA Country Program memorandums, Departments of State and Defense policy statements, and other related command and PSYOP guidances. The PSYOP mission may be directed or derived from a stated mission, or, for planning purposes, it might be deduced from operational objectives.

STEPS IN TARGET ANALYSIS

Step 1: Select a tentative target for analysis.

Select one tentative target from those identified in the Basic PSYOP Study. This selection should be based on:

- The supported tactical commander's needs and plans.

- The PSYOP mission as directed by the supported tactical commander.

- The factors which indicate the tentative target's vulnerabilities which can be breached with persuasive communication.

- The target's predispositions relative to a mission.

- Other situational factors which indicate the suitability of the group as a susceptible and effective target audience.

Step 2: Determine conditions affecting the target.

Conditions of the target refer to the external elements which affect the target but over which they have no control. These circumstances are the result of social, economic,

political, and military pressures and the physical environment.

Each condition selected must be considered in view of the target audience's awareness of the condition. The analyst must surface positive and negative influences to insure that a biased image of the target audience is not formed. The analyst must also consider the PSYOP task to be accomplished.

Step 3: Analyze attitudes of the target audience.

Attitudes may or may not coincide with behavior. They are the determinants of noncoerced behavior. For this reason, a major goal of a campaign is to reinforce or develop attitudes which support US psychological objectives. In addition to determining positive and negative attitudes, the psychological operator must determine their intensity; i.e., how strongly the target audience is predisposed to respond to the conditions which affect it.

Step 4: Determine target susceptibilities.

Susceptibilities vary with each PSYOP objective because the target responds in different ways and intensities to different appeals. Susceptibility will depend in large measure upon the values, needs, motivations, and drives of the group.

Values which must be taken into account when dealing with susceptibility include:

By whom do they expect decisions to be made? Do they accept decision from a single, all powerful source and believe that this is the way things should be done? Is there individual decisionmaking in the target group without regard for external authority, or is the democratic approach used?

How does the target regard man's relation to the physical and supernatural elements of nature? Is he superstitious, a stoic, or a fatalist?

What regard do members of the target audience have for time? Are they preoccupied with the past, present, or the future? If the time perspective is oriented toward the past, appropriate appeals might stress the need to preserve the customs and practices of the past.

Step 5: Formulate the psychological objective.

The psychological objective is based on the specific and implied tasks obtained from the mission and from target analysis. A psychological objective might be a single step or a series of intermediate steps designed to lead the target audience towards the desired behavior or attitude.

Should it be necessary to have a series of intermediate objectives, each one must be measurable and must accurately define the specific behavioral or attitude change desired. Each intermediate objective must be completed in logical order.

When establishing measurable activities for the target audience to accomplish, present activity levels must be determined and changes brought about by the psychological operations noted. Changes in attitude are more difficult to measure quantitatively than changes in behavior.

Attitude changes cannot be measured directly; they must be inferred through changes in the observed behavior of the individuals who constitute the target group. The psychological operator must, therefore, identify the relevant behavior indicators, determine the existing pattern of such activities, and establish methods by which to measure subsequent changes.

Psychological objectives are classified as cohesive and divisive.

Cohesive objectives: Cohesive objectives, whose successful achievement would strengthen or more closely unite the total society or particular target groups, encourage the individuals of the target audience to place the collective good above the individual good. Example objectives are good will, encouragement, compliance, and cooperation.

Good will is used to promote feelings of friendship toward the country or agency sponsoring the PSYOP effort and to convince the target audience of the desirability of the programs and goals of the sponsoring country.

Encouragement is used to foster confidence in the target audience in the success of the policies of the sponsoring country or agency and its allies, to sustain the morale of elements in the friendly country, and to identify the aims of the sponsoring country or agency with the popular or national aspirations of the people.

Compliance and cooperation are used to win acceptance of the policies of friendly authorities and the sponsoring country's military, paramilitary, and public safety forces; to encourage and stimulate support and participation in national programs; and to attract support of the country's aims and programs.

Divisive objectives: Divisive objectives are designed to separate the individual from his group, to separate a group from other groups, to separate a group from the society, or to disorganize a group or society. These objectives encourage the individuals in the target audience to place their self-interest above the interests of the group. Examples of divisive objectives are discouragement, defeatism, apathy, hostility and non-cooperation, discord, withdrawal, panic, subversion and resistance, surrender, defection, and desertion.

Discouragement, defeatism, and apathy are used to depress the morale of the target audience in order to reduce the degree of effectiveness of groups supporting popular or national aims dangerous to the interests of the sponsoring country.

Hostility and noncooperation are used to promote disbelief in the policy and ideology of the local and national authority hostile to the sponsoring country.

Discord is used to stimulate dissension and conflict within or between specific groups.

Withdrawal is used to intensify concern of the individual with his personal situation in order to reduce his support of group and national goals.

Panic is used to promote disorganized or confused behavior.

Subversion and resistance are used to encourage divisive and antipolitical acts, thereby undermining the political structure of the country, and to promote and support resistance movements against authorities hostile to the sponsoring country.

Surrender, defection, and desertion are used to encourage individuals or groups, among enemy military forces, to place personal considerations over group interests, thereby undermining military authority.

Step 6: Determine target effectiveness.

If it is determined that the target audience can be persuaded, its relative ability to implement a psychological objective must be assessed. The most obvious consideration pertains to the environment of the target audience. The constraints on the target audience which limit its ability to attain a significant objective must be determined. The analyst must also evaluate the ability of the target audience to act on suggested solutions.

In determining the effectiveness of the potential target audience, its relative power to influence other groups must be assessed. This requires a study of the power structure and of the relative positions of the potential target audiences within this structure; that group to which the potential target audience responds and under what circumstances it responds are given particular attention. Other groups in the area that respond to the dictates and desires of the potential target audience must also be noted. Any circumstances under which the standard relationships between the potential target audience and other groups in the area may be altered should also be determined.

The use of key communicators to reinforce the propaganda message and influence members of the target audience must be considered. In the military, especially among hostile military targets, key communicators are most likely to be political officers or the most courageous or aggressive members of the unit. When selecting key communicators, certain characteristics must be identified; among these are prestige, numbers, dispersion, and power.

Prestige: The individual who has prestige is called upon for guidance and leadership by virtue of his position. The prestigious person may rise to power or position because of age, influence, title, or other factors. Because other members of the group expect the prestigious positionholder to provide guidance and make decisions, they are prepared to follow him.

Numbers: There must be enough key communicators within the target audience to influence the audience. If there are only two communicators in a group of 500, their influence may be nullified by the will of the majority.

Dispersion: To be effective, key communicators must be adequately dispersed among the target audience. Dispersion insures maximum influence over the majority of the audience.

Power: The most critical characteristic of the key communicator is power which must be viewed from several perspectives of power: coercive, reward, legitimate, and referent.

Coercive power is the influence that an individual or group exerts over another, based on the ability of the persuader to punish. **It is effective only so long as the power to punish exists.**

Reward power stems from the persuader's ability to reward desired responses. **Reward power provides more satisfactory results over an extended period of time than does coercive power.**

Legitimate power refers to the mutually acknowledged right of an individual or group to control others. It is exemplified by platoon leaders, elected political officeholders, kings, parents, and supervisors.

Referent power is that influence carried by a particular social status, usually based on wealth, political position, birthright, and other factors that have no legal status. It is a common factor in day-to-day life, stemming primarily from the efforts of individuals to identify with a group.

When selecting key communicators, PSYOP personnel must keep in mind that key communicators are not supposed to interrupt the flow of communications. Their job is to receive the message and, by their interpretation, reinforce it among the people in the target audience.

If a potential target audience is not effective, the best course of action is to maintain a link with the group for future utilization.

Step 7: Determine campaign impact indicators.

Before the target analysis is complete, the target analyst must record the behaviors which indicate changes from existing activity levels. The specific behaviors (events) are referred to as campaign impact indicators. Campaign indicators assist in evaluating the effectiveness of PSYOP.

A PSYOP campaign is designed to produce a desired effect (some action, behavior, or perhaps, inaction) upon the target audience. The success of a campaign can only be judged by its effect. Effects analysis determines the impact of a propaganda effort on an audience. It assesses the relative success of propaganda and the reasons why a particular effect was achieved.

Propaganda effects analysis is a difficult task. Even under the best circumstances, it is hard to judge whether attitudes and opinions have been changed by propaganda. During limited or general war, analysis is even more difficult because the effects of propaganda often cannot be seen until the area becomes accessible. In a cold war situation, internal defense and development (IDAD), or consolidation operations the task is somewhat simpler and results are more accurate because the audience is generally more accessible. (See chapter 16.)

FACTORS WHICH CONTRIBUTE TO THE FAILURE OF PSYOP

Information may be difficult to find and requires a subjective (personal) evaluation. Failure to search all sources thoroughly for this information and lack of experienced personnel to make the required seasoned judgments will contribute to the failure of PSYOP campaigns.

Target groups frequently are not properly identified. PSYOP personnel must continuously study information to identify and define target groups clearly. This information is acquired through the submission of good intelligence requirements (EEI/OIR) to the appropriate collection agencies and repositories.

*Chapter Fifteen***15****THE PSYOP****AUTOMATED MANAGEMENT****INFORMATION SYSTEM (PAMIS)**

One of the day-to-day problems which can directly affect the quality of work is the massive amount of information that must continually be processed. Without electronic assistance, the information is limited to the content of a file supplemented by personal knowledge. Therefore, an electronic, systematic means of accumulating and presenting large quantities of relevant information is of value to PSYOP personnel.

The PSYOP Automated Management Information System (PAMIS) is designed to assist the PSYOP staff officer, intelligence officer, propaganda analyst, propaganda officer, and others in obtaining, maintaining, and using large amounts of information. It is a set of three interrelated information handling systems:

The PSYOP Foreign Area Data (PFAD) System - An automated means of storing and retrieving textual information, such as analyses, abstracts, extracts, and summaries about a country or region.

The PSYOP Foreign Media Analysis (PFMA) System - An automated means of storing and retrieving coded content analysis data about the mass media of countries of interest to the PSYOP unit or staff.

The PSYOP Effects Analysis System (PEAS) - An automated means of storing, processing, and presenting information pertaining to the effectiveness of PSYOP campaigns, media, themes, and programs.

These three systems are interrelated in that information from one can aid in analyzing data from the other systems.

PAMIS is managed and maintained by the Officer of the Joint Chiefs of Staff in conjunction with the Department of the Army. It utilizes computers and peripheral data processing equipment located in the Pentagon.

PSYOP FOREIGN AREA DATA (PFAD) SYSTEM

The PFAD System provides uniform procedures for the collection, storage, and automated retrieval of PSYOP-relevant information about a country or region of the world. Its purpose is to provide the PSYOP planner with information on which to base plans and estimates, and to provide the psychological operator with information and intelligence on which to base target analysis, propaganda development, and campaign planning.

The PFAD System does not duplicate area handbooks, intelligence annexes and estimates, or other similar materials. Rather, it supplements these with PSYOP-specific information, concentrating especially on facts and data which lead to the discovery of PSYOP vulnerabilities and opportunities.

Sources of material for the PFAD System

The PFAD System accepts material from a variety of agencies or sources: active and reserve PSYOP unit personnel, individual researchers and research institutions, and experts obtained specifically to meet PAMIS intelligence needs. The material references a source (e.g., a book, intelligence report, newspaper, cable, etc.).

PFAD System Contents Records

The PFAD System contains two basic computer records:

Source description record--the essential facts needed to describe adequately the nature of the source publication or document.

Subject narrative record--summary narratives of information about specific PSYOP subjects.

The purpose of the source description is to present to the user a brief overview and description of PSYOP-relevant material, such as books, periodicals, dissertations, government documents, cables, and the like. The user of the PFAD System can evaluate the source description printout (see figure 15-1) and determine whether to obtain the basic source document or to request the appropriate subject abstracts from the computer. He can request a computer printout (bibliography) that contains information on a given country, political group or movement, ethnic, social or religious group, or definitive subject or subjects.

The purpose of the subject narrative is to provide the social, cultural, economic, political, communication media, and other special information needed to make decisions on all aspects of PSYOP. Each entry is a short one-page abstract. Each narrative record, consisting of one or more abstract entries, is coded so the user can request subject data from the PFAD file in any combination of information elements. For example, the user can retrieve all subject information about a given nation or region of a country; he can select those subjects about electronic media relevant to specific population groups; or he can retrieve all PFAD data records on a given PSYOP target. Figure 15-2 is an example of a subject narrative record. In the case of translations into English, the entries may be larger than in the original language. The location and date of publication of the original source will be included, permitting further research.

Information for PFAD System

The agency which does the original research on a given subject provides the information by typing it in specific format on a magnetic typewriter tape. This tape cartridge is then mailed to the National Military Command System Support Center (NMCSSC); there it is converted and transferred to computer tape, and the information is checked and stored in one or two PFAD files: BIBLIOGRAPHY and SUBJECT.

Electronic data processed reports are provided on request. They consist of selected retrievals of key information used to prepare PSYOP estimates of the situation and basic PSYOP studies. Figure 15-3 is a coversheet for a PFAD System output report.

Using the PFAD System

The PFADS programmer is able to review and upgrade the data base by removing information of little or no value. In addition to the review process, the data base is structured to indicate areas in which information is missing so that research and intelligence priorities can be assigned to fill out these areas. By these two processes, the PFAD System provides a means for increasing the quality and quantity of information available for PSYOP uses.

DESCRIPTIVE ABSTRACT OF SOURCE

THIS UNPUBLISHED DOCTORAL THESIS DESCRIBES AND ANALYZES THE SOCIAL ANTHROPOLOGY OF ONE TYPE OF DRUZE VILLAGE IN LEBANON AS IT WAS IN THE EARLY 1950'S. MANY OF THE BASIC SOCIAL STRUCTURES AND RELATIONSHIPS DESCRIBED ARE COMMON TO OTHER VILLAGES IN THE ARAB MIDDLE EAST. HOWEVER, THE RELATIONSHIPS BETWEEN BOTH HORIZONTAL AND VERTICAL GROUPS ARE CHANGING, AS THE AUTHOR NOTES, AND THUS SHOULD NOT BE CONSIDERED NECESSARILY TO REFLECT THE 1973 CONDITIONS IN THIS OR OTHER VILLAGES IN LEBANON AND THE MIDDLE EAST.

SUBJECT NARRATIVE

(STUDY IN FOREIGN COUNTRIES)--SINCE THE ESTABLISHMENT OF THE GDR, ABOUT 10,000 GDR CITIZENS HAVE COMPLETED THEIR EDUCATION AT UNIVERSITIES AND ADVANCED SCHOOLS OF THE USSR, THE CSSR, THE POLISH PEOPLE'S REPUBLIC, AND OTHER SOCIALIST COUNTRIES. THESE GRADUATES ARE NOW RESPONSIBLY FULFILLING IMPORTANT TASKS IN VARIOUS BRANCHES OF OUR SOCIAL LIFE. MORE THAN 600 GRADUATES ARE EMPLOYED AS PROFESSORS AND LECTURERS IN THE GDR ADVANCED SCHOOL SYSTEM. IN 1974 THE NETWORK OF STUDY LOCATIONS WAS CONSIDERABLY EXPANDED. THUS, AT THE PRESENT TIME, ABOUT 5,000 GDR STUDENTS ARE RESIDING AND STUDYING IN 18 CITIES OF THE USSR, IN 9 CITIES OF THE POLISH PEOPLE'S REPUBLIC, AND IN 5 CITIES OF THE USSR.

FOREIGN MEDIA ANALYSIS (FMA) SYSTEM

The Foreign Media Analysis System provides a means of storing, retrieving, and processing information obtained from analysis of foreign communication media. Selected media are analyzed by foreign language coders (normally part of a PSYOP unit) to determine the amount of media space or time devoted to significant subjects or propaganda themes.

The basic unit for the FMA System is the dominant subject (or propaganda theme) of the printed article or news broadcast related to a specific country or government. The coder/analyst is required to follow established conventions and rules in classifying and coding each input unit according to the following queries:

What is the main thrust or manifest content of the printed article or news item?

What governments, international organization, or political movements are the subject of the article or news item?

What is the tone of the article toward the governments or institutions, or international organizations?

How much space (in square centimeters) or time (in minutes) is devoted to the subject?

Does the article or news item contain information of significant personalities, events, or subjects important to PSYOP? Such articles or news items are summarized for the FMA textual file.

This information is checked to insure validity and uniformity of coding and is then keypunched on 80-column cards. The data are transmitted by AUTODIN to the NMCSSC computer site in the Pentagon where it is audited, edited, and stored.

The FMA System provides both standard and special request reports. The standard reports are identified as:

PSY1-01 - Major Subject Categories by Source

PSY1-02A - Report About Theme Countries

PSY1-02B - Report About Other Countries

PSY1-03 - Coverage by Rank Order of Foreign Governments by Tone

PSY1-04 - Coverage by Regions of the World

PSY1-05 - Subject Index to FMA Media

PSY1-10 - Clear-Text or Narrative Abstracts

The purpose of the PSY1-01 printout is to give the analyst a knowledge of:

The square centimeters of space or time (measured in minutes) allocated to broad FMA domestic subjects by each medium over a designated period of time.

The percentage of total coverage allocated by the media to foreign events, governments, and institutions.

The purpose of the PSY1-02A and PSY1-02B printout is to provide analysts with:

A statistical analysis of the amount and tone of media coverage for each country or international organization.

A statistical analysis of communication trends by subject and tone.

A correlation analysis of these data with each of the 700 FMA subjects.

A comparative analysis by content and tone of media directed at the domestic as compared with international audiences.

Hypotheses and inferences from trend data confirming or denying other intelligence.

The purpose of the PSY1-03 printout is to sort by media and tone (critical, neutral, favorable) FMA data on foreign countries. A comparison of three time periods can be processed for any one PSY1-03 report. Any combination of these time periods can be specified by the user.

The purpose of the PSY1-04 printout is to summarize foreign media data about all foreign governments in specific geographic regions. The PSY1-04 printout provides the analyst with a one-page summary of media coverage of foreign governments in relation to other governments according to geographic regions.

In order to adequately analyze foreign communications media, it is necessary to examine the qualitative aspects of a news item or feature article, as well as the quantitative data. In other words, the actual story or news item must be read to obtain the "flavor" of the presentation or arguments in a qualitative sense. The PSY1-05 provides information about the location of articles in the source document or audio tape. It provides a "library" index similar to the New York Times Index for each FMA source. Another purpose of the PSY1-05 printout is to provide analysts with a consolidated listing of FMA data about a particular country or government.

The purpose of the PSY1-10 printout is to provide users with a synopsis of those articles or news items of major interest to PSYOP programs.

In addition to the PSY1-series reports that have been described above, statistical data can also be processed by using the Online Data Processing System (ODPS) available to users of the FMA system. A variety of data processing routines, such as histograms, line graphs, trend analysis, and tabular reports, are available at NMCSSC. Also, special processing can be requested in order to use data contained in FMA computer records concerning a particular inference or hypothesis. (See figure 15-4 for a schematic of the FMA system.)

PSYOP EFFECTS ANALYSIS SYSTEM (PEAS)

The PSYOP Effects Analysis System is designed to collect and process data on a target audience to measure the impact or effect of US and allied PSYOP. In addition, PEAS will store and process data about friendly and hostile PSYOP activities and actions. Figure 15-5 presents the relationship of the PEAS with the PFAD and FMA Systems.

Data Worksheets

Data worksheets are used to collect and organize the data in accordance with an 80-column punch card format. Data are organized in PEAS by:

Units or activities responsible for initiating US/allied propaganda and PSYOP activities.

Units or activities delivering or disseminating US/allied PSYOP messages and actions.

Military intelligence, civilian, PSYOP, and other interrogators.

Units or activities responsible for monitoring hostile propaganda and actions.

PEAS Worksheets

The PEAS worksheets have been designed so they can be completed in two stages:

Initial data collection by non-PAMIS-trained personnel.

Coding by personnel trained in PEAS methodology and coding conventions.

The data are compiled by answering a series of questions on appropriate worksheets. The worksheets are then sent to a PSYOP unit for insertion of punch card transcript data codes, verification of data, preparation of data cards, and submission to an electronic data processing (EDP) support facility for processing and storage.

Who says what, how, to whom, under what circumstances, for what purpose, and with what effect?

FIGURE 15-4

THE FMA APPROACH TO CONTENT ANALYSIS

FIGURE 15-5
RELATIONSHIP OF PSYOP EFFECTS ANALYSIS
SYSTEM WITH PFAD AND FMA SYSTEMS

Storage and Retrieval

Following validation, transaction cards are converted into a format suitable for digital storage and retrieval and stored on one of several PEAS data files. (See figure 15-5.)

File ACTIV (Activities). Data from this file provides information about the effort devoted to the various mass media channels and other methods of communication. Information about other types of action is also available; i.e., those that are designed primarily for psychological effect, such as show of force, supply drops, medical relief, etc. File ACTIV also provides PSYOP commanders with uniform procedures and methods for reporting and analyzing US and friendly PSYOP activities. It provides data on the effort supporting:

- Specific campaigns.
- Various PSYOP objectives and tasks.
- Propaganda themes.
- Target groups.
- Military units and civilian agencies.

PEAS Impact File. The PEAS Impact File provides PSYOP commanders, target analysts, and others with systematically collected feedback about US and allied propaganda messages and PSYOP actions. Data collected for the Impact File is only one element in determining the overall effect of PSYOP. It does not replace the collection of data about propaganda messages from panels or data collected by means of in-depth interrogations.

Use of PEAS Worksheets (Impact Data Records). The PEAS data collection format is useful for prisoners-of-war interrogations at the brigade and division levels of command. Each PEAS impact record pertains to a respondent's reaction to an electronic or printed PSYOP message. In the interrogation process, the respondent is required to select or identify the PSYOP message(s) that he has seen or heard.

PEAS impact data messages (worksheets) are then completed for those US/allied propaganda messages identified by the prisoner or other respondent. A combination of casual statistical data and clear-text narrative information is used to evaluate the impact of PSYOP campaigns, objectives, tasks, and themes. The PEAS computer program can correlate that portion of the PSYOP record containing effect data with information about target groups, PSYOP objectives/tasks, PSYOP themes, and other actions. These data should provide commanders with indicators about the success or failure of military PSYOP.

The PEAS POLWAR File. The POLWAR File of the PEA System provides uniform procedures and methods for reporting and analyzing hostile propaganda and actions directed at US and allied populations. Data from the file allows continuous monitoring of the hostile POLWAR at the tactical command level. This file of the PEAS interfaces with the Foreign Media Analysis System of PAMIS.

The POLWAR File is concerned with those communications and actions that take place in a combat environment. This contrasts with the FMA System whose interest is primarily strategic and is concerned with those media directed to the domestic audience. The operational objectives of the POLWAR data file are to:

Pinpoint those military units that are the target of hostile propaganda and psychological actions.

Highlight and quantify enemy propaganda objectives, tasks, and themes.

Highlight enemy propaganda to friendly ethnic groups and other special targets.

Provide indicators of the impact of hostile PSYOP on US and allied military populations.

In addition, a systematic analysis of hostile POLWAR activities provides valuable clues concerning the impact of our own PSYOP programs on the enemy. Standard practices and operating procedures should be established by the theater commander to monitor hostile propaganda and to collect data. An 80-column punch card format is used to collect and organize the POLWAR data. It can be completed by military PSYOP teams, military intelligence, radio monitoring teams, special police, national information agencies, and others.

Chapter Sixteen

PROPAGANDA ANALYSIS

The psychological operator uses propaganda analysis to:

- Reveal opportunities for PSYOP exploitation.
- Assess the effects of enemy and friendly propaganda.
- Collect intelligence related to PSYOP.
- Obtain intelligence for other uses.
- Supplement other intelligence.

Tools of the Analyst	16-2
Scope of Propaganda Analysis	16-3
Methods and Procedures	16-3

16

TOOLS OF THE ANALYST

The propaganda analyst works primarily with foreign mass communications that attempt to influence the conduct, attitudes, opinions, and emotions of groups. A foreign country's daily output of official printed media, radio and television broadcasts, and wire service releases provides the greater portion of material. This material assists in analyzing:

Morale.

The level of morale of a nation may be determined by its domestic propaganda. For example, domestic propaganda quietly and unemotionally delivered generally reflects high morale, while silence, bluster, or strident propaganda suggests low morale.

Involuntary Information.

Propaganda may contain news, opinions, and entertainment. Valuable information can be obtained from a careful analysis of this material. For example, the space a government gives to its leaders in its propaganda is often a measure of the relative power of individuals within the hierarchy.

Biographic Information.

Events may provide biographical information on particular individuals. For example, the presence of a new personality at a publicized ceremony may indicate a shift in the power position of that person.

Economic Data.

Economic information may be derived from statistics reported in propaganda, even if the statistics are false. Comparisons with previous data often give valuable clues about industrial or agricultural output, manpower shortages, or other economic conditions.

Propaganda Inconsistencies.

Any inconsistency in propaganda may provide insight into conditions in the source's homeland, including the condition of its combat forces.

Intentions.

Propaganda may be used to conceal the real intentions of the source. An example is an attempt to convey the impression that any future outbreak of hostilities will be the fault of the other nation.

SCOPE OF PROPAGANDA ANALYSIS

Propaganda analysis is the detailed examination of the source, content, audience, media, and effects of propaganda. Propaganda analysis permits the analyst to arrive at valid conclusions that will result in effective PSYOP campaigns. These elements are interrelated and cannot be analyzed independently. In short, propaganda analysis provides answers to the basic questions: WHO says WHAT, to WHOM, in WHAT MANNER, for WHAT REASON, and with WHAT EFFECT.

A word of caution: To distinguish minor, transient themes from those that are basic (major) and continuing, the analyst must collect sufficient information over an extended period of time.

METHODS AND PROCEDURES

The first step in the propaganda analysis process is to analyze the communication system. At the basic level, a communication model consists of a source, message, and destination. The relationship of the items for analysis (source, content, media, audience, effects) to the basic elements of the communication system (source, message, destination) are illustrated in figure 16-1.

COMMUNICATION ELEMENT	SOURCE	MESSAGE	DESTINATION
COMPONENT OF PROPAGANDA ANALYSIS (ANALYTIC FUNCTION)	SOURCE ANALYSIS	CONTENT ANALYSIS MEDIA ANALYSIS	AUDIENCE ANALYSIS EFFECTS ANALYSIS

FIGURE 16-1
RELATION OF COMPONENTS OF PROPAGANDA
ANALYSIS (ANALYTIC FUNCTIONS) TO
COMMUNICATION MODEL ELEMENTS

Each type of analysis (source, content, audience, media, effects) has its own procedure. For example, when the audience is accessible, it is possible to analyze effects by the use of personal (structured) interviews and questionnaires. If not accessible, less direct procedures must be employed. On the other hand, source and audience analyses are more dependent on specific information about the source and the target audience than on procedures.

Once the universe of communications has been defined and the analytical categories selected, quantitative analysis can be performed. This is done by counting the number of entries in each analytical category from each unit of analysis of the media. Statistical comparisons and analyses can be performed from these counting operations. Qualitative or interpretive analysis is required to illuminate or supplement these quantitative findings.

Source analysis. The source is the individual or organization sponsoring the development and dissemination of the propaganda. Analysis of the source gives the analyst an understanding of the credibility of the source and its proximity to the center of government, military command, and other important persons.

Actor and authority.

Actor refers to the persons or entity apparently initiating the propaganda. Authority, on the other hand, refers to the person or entity in whose name a statement is made. Sometimes the actor and the authority are the same.

Author.

One of the major reasons to analyze propaganda is to establish authorship--to determine where in the spectrum of power the propaganda originates. The author and authority may be the same, especially if the author is well known to the target audience; e.g., Winston Churchill.

Content analysis. Content analysis, the most important element of propaganda analysis, depends on sound analytical methods and reliable, accurate information. It is the analysis and evaluation of statements to determine the motives and objectives of the source. It reveals the meaning and reasons why the message(s) was disseminated. Because content (what is said) is the major element of communications, content analysis constitutes the major effort of propaganda analysis. Direct access to the target audience is not required.

Procedures for content analysis range from the application of objective, quantitative techniques to the application of entirely subjective techniques. Objective techniques systematically analyze content over a period of time by classification systems and statistical tables.

Subjective content analysis is based on the background, "gut feeling," and judgment of the analyst.

A combination of both methods is required for a valid product; statistics, equations, and tables must be interpreted.

How it's done:

STEP 1

An assumption (hypothesis):

Whichever approach is taken (objective, subjective, or a combination), the first step is to set up an assumption (hypothesis) to be proved or disproved. The hypothesis is actually an educated guess as to what the analyst believes to be the motive for some psychological action or propaganda message. It may be necessary to change the hypothesis as the analysis develops. In some cases it may be necessary to repeat the entire process.

STEP 2

Sampling:

The next step is to decide which specific items to examine for content. The analyst will seldom have free access to all the propaganda produced by a source, so he must take samples of the source's propaganda. The sample must be large enough to provide an accurate indication of the propaganda produced. It must also be representative, having the characteristics of the propaganda output. Sampling for content analysis involves the following operations:

The analyst must determine which communications (publications, commentary, etc.) to examine--which newspapers, which magazines, which radio or TV stations.

Having decided which titles he will examine, the analyst must next decide which issues he will analyze. For example, having decided to examine a particular newspaper, he must decide which issues--Monday? Tuesday? etc.

Having made these decisions, the analyst must decide what part of the publication or broadcast he will examine--the front page? editorials? evening newscasts? etc.

Next the analyst determines the unit of analysis for counting the content elements. The original assumption will help to determine which are appropriate. Major units of measure are:

Words. The word is the unit of analysis. Use of this unit results in a list of relative frequencies of selected words.

Phrases. A variation of the word is the phrase. Phrases generally fall into the categories of cliches, idioms, or slogans.

Sentences. This category is an extension of phrases.

Topics and themes. Topics are appropriate when only the subject matter is considered without any embellishment by value judgments. Lists of topics can be prepared without any reference to actual propaganda content. Themes are more appropriate when the subject matter and the value judgments (positive or negative) associated with the subject matter are addressed. Themes tend to be derived more from the actual content than do topics. **A theme implies a topic, but a topic does not necessarily imply a theme.**

Examples:**TOPIC****THEMES**

Military maneuvers

The unbeatable
division

Farm production

Five percent feeds
the world

The farmer

The backbone of
the country

Item. An item is a complete unit of a medium devoted to a specific subject. The item will differ according to the medium used. It may be a news story, an editorial, a magazine, a book, a radio or TV program, or any other complete, self-contained expression of ideas. Items are convenient units when using broad, general content categories covering a large range of subjects over a relatively long period of time.

Space-Time Units

Number of lines, paragraphs, pages, chapters, square centimeters.

Column inch.

Footage (film or videotape). This translates to time measure (minutes).

Minutes; e.g., broadcast time (loudspeaker, radio).

When using units of count or measure, more than one unit can be used for any given analysis. The purpose of the analysis determines the units to be used.

STEP 3**Basis for classification:**

The next step is to consider the characteristics of propaganda messages that can be used for classification or category formulation. Message content may be broken down into two major categories: what is said and how it is said.

On the basis of what is said, the following breakdown is appropriate.

Subject matter.

Most information is classified on the basis of subject matter.

PAMIS FMA.

The PAMIS Foreign Media Analysis System categorizes propaganda on the basis of subject matter (among other categories).

Values of the message originator as reflected in content.

Values are the ideals and goals of a society or other group; they affect the behavior of members of that society or group. Themes such as "freedom of

speech," "freedom of religion," and "freedom of press" are examples of content categories which represent values.

Direction--pro or con.

Propagandists are either for or against something. This is apparent in the content of their propaganda. The directional approach (pro or con) may be combined with the subject matter category, or it can be used alone. In this approach, the subject matter is indicated and judgments are made as to how the subject matter was treated by the propagandist; i.e., positively, neutrally, negatively.

Regionalism.

Propaganda may be classified on the basis of its geographic origin (regionalism). This classification and analysis depend upon the ability to monitor regional publications and broadcasts. The emphasis is on associating subject matter and its treatment with geographic areas.

On the basis of how a message is stated, the following categories may be used.

Form or type of communication.

Forms or types in newspapers include editorials, news, features, comment, letters to the editor, fiction, etc. Radio and TV content may be classified as music, news, commentary, special features, drama, variety, and talk.

Form of statement.

Much propaganda consists of arguments or appeals; i.e., a conclusion with supporting rationale.

Intensity.

From the strength of an appeal or argument, an analyst might determine the potential impact on audiences as well as how strongly the source feels about a specific issue. One technique is to measure intensity involved by identifying emotion-laden terminology, classifying the expressions in terms of direction (i.e., positive, neutral, negative), and counting the frequency of such terms.

Propaganda tricks of the trade.

In those instances when the logic of an argument or appeal is weak, propagandists revert to techniques known as tricks of the trade. These techniques may also be used to bolster valid arguments and appeals. In many cases, certain techniques may be used to address specific target groups or subject matter areas. A good reason for analyzing tricks of the trade is that they may give the first indication that the material being analyzed is propaganda. (See appendix I for more complete coverage of tricks of the trade.)

Language used.

The language and dialects used, the most obvious features of propaganda, are the best indicators of the intended target audience and its characteristics.

Mode (as a reflection of intent or purpose).

A particular manner or style can sometimes be used as a basis for classifying propaganda output. Four possible categories (others may also be used) might be image enhancement, image destruction, persuasive, and threatening.

As in all intelligence analyses, the results must be presented to the users. Normally, a tabular chart indicating totals for each category for each period of time would be used to permit comparison of coverage. These totals can be converted into charts, bar or pie graphs, etc. In the case of pure qualitative content analysis, the results are primarily word pictures based on impressions rather than numbers.

STEP 4

Analysis of results:

The analyst takes the results of his study and examines them in the light of his hypothesis. Using quantitative content analysis techniques, the analyst reviews any charts or graphs depicting the final results of the count and decides whether the hypothesis (original assumption) is supported or not. By this means the analyst determines trends in a time series and relative emphasis in comparative studies, depending upon the hypothesis.

STEP 5

Final inference:

The final step, based on the proof or lack of proof of the hypothesis, is drawing the inference which can be used by the analyst to reach useful conclusions on current conditions or future actions.

Audience analysis. Audience analysis is the study of the total audience that the propaganda reaches or seeks to reach. An audience may include those persons who were not the intended target for propaganda but who have received the message. Audiences may range from a highly general category, such as the Russian people, to a specific category, such as a rifle company. They may be defined as specific groups in terms of income, nationality, geography, ethnic, political, religious, social, economic, classes or castes, etc.

Should propaganda content be classified according to audience, decisions must be made as to whether the apparent or inferred audience (or both) should be considered. In case of inferred audience, stringent specific criteria must be spelled out for making the inference. Tables and matrixes may be constructed to make the analysis more valuable.

Media analysis. The analyst is interested in the specific medium used, why a particular medium was chosen, what media capabilities an adversary has, and how consistent the message content is in the various media.

A minimum requirement for message effectiveness is that it be received and perceived by the intended recipient. The sensory mechanisms required to perceive a message are used as the most fundamental classification of media. Briefly, messages can be perceived visually, aurally, or aurally and visually. The breakdown of receptor mechanisms and corresponding media are as follows:

VISUAL	AUDIO	AUDIOVISUAL
Books Magazines Pamphlets Leaflets Posters Handbills Calendars Novelties Photographs Newspapers Signs (fixed and mobile) Banners	Radio Loudspeakers (carrying live or prerecorded messages)	Sound motion pictures Tape and slide combinations Cassette and filmstrip combinations Television Activities (e.g., military civic actions, show of force, rallies, demonstrations) Interpersonal (face-to-face communications)

Periodicity.

Time or periodical patterns of operation can be used as a basis for classification. Printed media are generally classified according to their periodicity; e.g., daily, weekly, biweekly, monthly, etc. Radio and television programs can be classified on the basis of their broadcast times within a broadcast day or on other time schedules; e.g., a daily feature, a weekly feature, a morning or evening feature, and a feature at 1800 hours, etc.

Placement of content.

The physical position or placement of content within a medium may be used as a basis for classification. Printed material might be classified as lead stories, cover stories, center spreads, front page news, etc.

Place of origin.

Sometimes origin is openly acknowledged, and other times it must be inferred. The origin of radio and television broadcasts may be established by direction-finding techniques. The precise source of material contained in other media may be more difficult to pinpoint.

Technical characteristics.

Radio and television broadcasts can be classified on the basis of the frequencies or channels employed, modulation, and the strength of the signal (the likely power at which the signal was transmitted).

Printed material (also signals) can be classified on the basis of methods used to reproduce the material. The number of pages, quality of paper, and typography might be used as a basis for classification.

Printed media and television may also be classified on the basis of color or black and white.

Media are sometimes linked with delivery systems, which also serve as a basis for classification. For example, loudspeakers can be stationary, hand-carried, truck-mounted, tank-mounted, or aircraft-mounted. Leaflets may be delivered by fixed or rotary-wing aircraft, balloons, sea floats, artillery, bombs, and mines, or they may be disseminated by hand.

Mode of transmission.

Media can be classified as overt or covert. Covert transmission would include surreptitiously delivered leaflets, handbills, posters, and broadcasts from clandestine radio stations.

Acknowledgement by source.

The extent to which a source acknowledges its output may be used as a basis for classifying media (and content). White, gray, and black propaganda fall within this classification category.

Legal status of disseminator.

By international convention, countries broadcast on assigned frequencies and power output. Not all broadcast facilities adhere to this convention. Thus, broadcast stations can be classified on the basis of their registration and the extent to which they adhere to regulations. Some clandestine stations are clandestine only because they do not adhere to international broadcast codes.

Some indicators of problem areas.

Supply shortages may be indicated by poor grades of ink or paper used in the source's printed propaganda. Weak radio signals, interrupted programs, poor program production, or a lack of operating stations suggest a lack of signal equipment, facilities, supplies, and trained personnel.

Effects analysis. In analyzing hostile and friendly propaganda effects, the analyst attempts to determine the effect of the source's propaganda upon the target audience and the reasons why it was effective, partially effective, or totally ineffective. Four general types of evidence help to ascertain if propaganda has or has not been effective. These are responsive action, participant reports, observer commentaries, and indirect indicators.

Responsive action is behavior which can be more plausibly attributed to propaganda than to any other stimuli in the environment of the target audience. In the ideal case, a one-to-one ratio can be established; e.g., immediate surrender of troops precisely as directed by a combat loudspeaker broadcast. Rarely, however, can responsive action be attributed to propaganda appeals alone; often the appeal, at best, has crystalized an existing tendency for action.

Participant reports are accounts received from members of the target audience on how they were affected by the propaganda. These reports may be emotion laden and are less reliable evidence than responsive action; they may not truly reflect the individual's response. In accessible areas, participant reports are valuable because a great variety of participants can be asked how they felt about the propaganda.

Observer commentaries are reports by witnesses to a situation in which they were not involved. Depending upon the perceptiveness of the observer, his assessment of the situation may or may not be accurate. Information from observers may be taken at face value. Observer commentaries may be taken from such persons as agents stationed within the target area, PWs, escapees, defectors, reporters, businessmen temporarily in the area, etc.

Indirect indicators are the events that occur in the area of operations and appear to result from PSYOP although not directly suggested by PSYOP. Indirect indicators fall into four major categories:

Physical actions barring reception. These are actions taken by the enemy to prevent the audience from receiving external communications. Barring of entry of printed material and jamming of radio stations are examples.

Psychological conditioning. A government or military commander might initiate actions which, while not physically preventing reception of external communications, are designed to cause the audience to avoid them. For example, the government or military commander might try to convince the audience that the source cannot be believed, or harsh penalties might be enforced for listening to, viewing, or reading communications from external sources.

Persuasive efforts. If the audience did receive the communication in spite of the efforts of its government or command, a counterpropaganda program might be initiated. Content analysis could reveal this effort.

Apparent related events. Events may occur that can logically be inferred to be associated with the psychological operations or propaganda although they were suggested. Before these events can be accepted as indirect indicators, all causative external factors other than propaganda must be accounted for.

Several techniques are available to analyze the relative effectiveness of US Army propaganda campaigns. These often indicate effective and ineffective themes and the principal concerns of specific audiences.

Public opinion polls, if properly used, present a fairly reliable index of propaganda effectiveness. Do not assume, however, that the results of polls precisely mirror the views of the people.

Prisoner-of-war interrogations and surveys can furnish valuable data regarding US Army propaganda effectiveness. Selected prisoners should be given specific written or oral questions regarding themes, format, color, appropriateness, programing, location where seen or heard, steps taken by recipients, actions taken by local authorities, and other feedback information to be used to improve the overall program.

Prisoner-of-war panels are valuable in determining propaganda effectiveness. A planned message is presented to the panel, and members are questioned as to the credibility or validity of the message. Weak propaganda may be detected and corrected

before it is used. The panel may point out poorly composed propaganda messages caused by a lack of full understanding of enemy psychology, terminology, and customs. This technique may suggest ways to strengthen particular themes into account previously unknown factors.

Other sampling techniques may be employed. One technique involves sampling of opinion leaders; i.e., those persons whose positions enable them to influence public opinion. This technique is particularly useful in occupied areas. Analysis of personal letters and captured personal documents is often rewarding because the writers usually express their true sentiments regarding their immediate environment, conditions at home, enemy propaganda techniques, and other pertinent factors.

Disintegration of enemy groups suggests low morale. An enemy group which was subjected to intensive propaganda attack and which is now disintegrating may provide clues to the effectiveness of propaganda operations. The number of enemy soldiers who surrender is generally not an accurate measure of propaganda effectiveness because of the many factors involved which actually induce surrender.

Current information on enemy morale--number of defections, increase in political arrests, strikes, mutiny, etc., as determined from PW reports, monitored radio reports, and other information--should be used by the psychological operator.

Chapter Seventeen

17

FACE-TO-FACE/AUDIOVISUAL/ VISUAL/AUDIO COMMUNICATIONS

Media are categorized by methods of dissemination: face-to-face (interpersonal), audiovisual, audio, and visual.

17

Face-to-face (interpersonal) communication is the most effective means of transmitting a persuasive message. It is employed in rallies, rumor campaigns, group discussions, lectures, show-and-tell demonstrations, social organizations, social activities, entertainment, and individual person-to-person contact, all providing a participating experience for the individual or group to recall later.

Audiovisual media such as television, electronic tape recordings, and sound motion pictures are the second most effective means of communication available to the psychological operator. Effectiveness is based on seeing and hearing the persuasive message. These media are an excellent means of transmitting persuasive messages and eliciting a high degree of recall.

Audio media (loudspeakers and radio) lend themselves to the transmission of brief, simple messages and to personalization by use of the human voice. They require little or no effort by the audience, and generally, they have more appeal than visual media. Also, the barrier of illiteracy may be more easily overcome with audio media than with visual media (printed material).

Visual media can transmit long, complex material. Animated or still cartoons may be used to convey themes to illiterate and preliterate target audiences. Visual media generally have the least amount of popular appeal.

Themes are reinforced and the target audience given broad coverage by using several media to deliver the same basic message. For example, radio and television can augment leaflets; face-to-face communication can support newspaper circulation.

CRITERIA FOR SELECTION OF MEDIA

Acceptability and credibility.

A complete target analysis will indicate how acceptable and credible a particular medium is to the target audience.

Availability.

The availability of media, the mechanical capability of message production, and the capability to deliver the message, as well as the ability of the audience to receive and understand it are important.

Timeliness.

Production and dissemination lag for each medium must be considered. For example, a medium requiring a long production or dissemination time would not be suitable for a message exploiting a target of opportunity.

Quantity.

The media selected should be mixed, one medium reinforcing the other, and delivered in sufficient volume to insure that the entire target is exposed to the message. Care, however, is required to prevent counterproductive oversaturation of the target audience. This requires analysis of intensity and timing of propaganda dissemination.

Themes.

The theme to be conveyed will have a bearing on the selection of the best media to transmit the message.

Suitability.

The media selected must be suitable for the target. The language selected, vocabulary, and level are also important factors. For example, it would not be appropriate to use newspapers or other printed text to deliver a message to an illiterate audience. A professional journal might be the most suitable means of reaching a professional audience.

CATALOGING

PSYOP units should prepare catalogs of media material which applies to recurring themes and general audiences. These catalogs should include printed material, loudspeaker and video tapes, motion picture films, and specialty items available to PSYOP.

FACE-TO-FACE COMMUNICATION

Face-to-face communication ranges from two or more individuals in informal conversation to planned persuasion among groups. The credibility of the PSYOP messages delivered by face-to-face (interpersonal) communication is increased when the communicator is known and respected.

Advantages

Relationship	It employs an interpersonal relationship.
Audience selection	The audience can be deliberately selected and the appeal directed and tailored for it.
Assessment of impact	Feedback is immediate. The communicator can immediately assess the impact of his message and adjust his approach to obtain the desired response.
Limited support required	Limited technical and logistical support are required.
More credible	It can be more credible than other methods because the target audience can evaluate the source.

Presentation	Complex material can be presented in detail. Frequent repetition and slight variations can be readily used to influence the audience.
Expeditious	In some instances, particularly in primitive areas, it may be the most expeditious method of disseminating propaganda.

Disadvantages

Limited use in tactical situations	Use is limited in general war due to the inaccessibility of the target individual or group. It has limited use in tactical combat since the psychological operator has little face-to-face communication with opposing forces until they are captured or defect.
Close control necessary	It must be controlled, especially at the lowest levels where each communicator has the responsibility to interpret policy and objectives. The control factor is best illustrated by trying to pass an oral message, one person at a time, throughout a group. By the time the message reaches the end of the group, it does not resemble the original message. Reinforcement by other media is necessary to eliminate this problem.
Limited by insecure areas	Security considerations limit the conduct of face-to-face communications. As the security situation improves and more areas are secure, area coverage can be extended.
Requires able communicators	It requires knowledgeable, orally persuasive individuals who can convince the target audience that the program and policies are irresistible and inevitable.
Normally require indigenous personnel	For effective communications, indigenous personnel are normally required.
Range of voice limited	The range of the human voice and the need for visual contact limit this method to relatively small audiences.

TELEVISION

Television, including video tape recording (VTR), is one of the most effective media for persuasion. It offers many advantages for PSYOP, and its wide application in other fields contributes to its acceptance and use. It is appropriate for use in limited, general, and cold war and is particularly effective in FID and consolidation operations.

In places where television is not a common communication medium, receivers may be distributed to public facilities and selected individuals. A possible limitation in enemy countries, however, is that television receivers may be set to allow reception on only one or two channels under government control.

Television is an all encompassing-mass communication medium. Like radio, it makes use of the sense of hearing to convey an idea. Like printed material, it makes use of the sense of sight, adding the element of motion. And like the motion picture, it combines sight, sound, and motion. Television is immediate; in effect, it places the viewer in two locations simultaneously, creating the illusion of participating in a distant event.

Advantages

Speed	Television programs can reach large segments of the target audience rapidly. The transmission of events can be instantaneous.
Overcomes illiteracy	Illiteracy is not a barrier; an audience need not be able to read.
Unifies	Television brings people in widely separate locations closer together by exposing them visually to the same ideas and concepts.
Aural-visual	Television appeals to two senses, each reinforcing the other. This gives the viewer a sense of involvement.

Disadvantages

Range	Geography and atmospheric conditions affect the strength and range of the signal. The signal may, however, be boosted with relay stations, airborne transmitters, or satellite relay to increase the transmission range. Airborne antenna relay domes extend the range of a central transmitter but at great expense.
Reception	Television sets are unevenly distributed throughout the world. Messages disseminated by television will normally be received only by those within an above-average income range and economic class in many areas of the world, particularly in developing nations. In some developing nations, however, group listening/viewing centers may be available, negating the link between income and access to television. The association should be carefully determined for each target country. The fact that receivers in the target area may not be compatible with the transmission equipment is another disadvantage.
Power	Most television receivers require an outside source of electric power. Many areas of the world lack this power. The introduction of self-contained power packs partially eliminates this problem. If broadcasts are to be made from areas lacking power facilities, special generators and a fuel supply may be needed.

Vulnerability	Equipment and parts are fragile and extremely vulnerable to damage. Stations are easily identified and make excellent targets. Receivers are difficult to hide.
Program requirements	A substantial production staff and supporting equipment are required to produce daily programs. Each day's operation requires a large amount of film, video tape, and live programming to sustain a program schedule.
Maintenance	Maintenance is highly technical, requiring trained and skilled technicians and engineers; such people are difficult to find.
Personnel	Television is a complicated communication medium, demanding specialized personnel with a wide range of scarce skills.
Audience accessibility	Although TV is excellent in friendly or neutral areas, it will not reach audiences in hostile areas unless a means is found to enter sets in these areas. Incompatibility of receivers, extreme distortions caused by two transmitters on the same wavelength, jamming, and censorship limit the use of TV broadcasts to hostile areas. Community viewing provides an opportunity to present TV programs which help the people identify with the sponsor (generally the established regime). If it is necessary to provide receivers, one technique is to place them initially in urban centers, extending them to rural areas as equipment and power become available; or vehicles equipped with power generators and TV sets may be moved into and out of areas as required.

VIDEO TAPE

Video tape, an offshoot of television, is an excellent means of recording and projecting messages. It can replay a scene from the camera immediately after it is recorded. The tape can be used in either portable or studio recording systems, being processed electronically as it moves through the video tape recorder.

Although most commercial tape is 5 centimeters (2 inches) wide, the US Army primarily uses 1.875-centimeter (3/4-inch) cassette tape. The scenes from each size tape can be readily dubbed on to the other.

Advantages

The results of the "take" can be seen immediately; if editing is necessary prior to release to the audience, it can be done electronically as the material is being produced. There is no time lag as with film which requires chemical processing.

The tape can be reused a number of times, erasing itself as it is run through the recorder, or it can be quickly erased on equipment made for that purpose and then reused.

Video tape is virtually indestructible and can be used in almost any environment in which humans live.

The tape can be placed on readily available video cassette players which feed directly into commercial television receivers. With special equipment, video-taped scenes can be projected onto large motion picture viewing screens. The requirement for special projection equipment is not unique, as special equipment is also required to project filmed scenes on television screens.

Video tape can instantaneously project scenes in black and white or color, with natural or dubbed sound, on open (public) or closed (limited audience) circuits.

With the use of video tape, scenes may be recorded for a permanent record or for future use.

Disadvantages

The disadvantages of video tape are those inherent in the television medium.

MOTION PICTURES

Motion pictures combine many aspects of face-to-face communication and television by creating a visual and aural impact on the target audience. Since US Army PSYOP units are not able to produce motion pictures, appropriate films may be selected from available sources; effects on the target audience must be carefully considered.

Four general types of motion pictures are adaptable for psychological operations:

Entertainment.

These are standard commercial productions, including animated cartoons. Entertainment films developed specifically for propaganda purposes can be very effective as the themes may be woven into the plot of the movie. These films can be very effective in gaining attention for other propaganda.

Newsreels.

In the developing nations, newsreels are still a major attraction. They are on the scene and show exactly what is happening or, with good editing, give that impression. By careful, skilled editing and arrangement of sequence, news events can be used as propaganda.

Documentary.

This type of film--ostensibly an objective presentation of a scene, place, condition of life, or a social or political problem--is a prime

means of propagandizing a target audience. This is done by careful selection and sequencing of scenes and events.

Training films.

Themes can be hidden in the presentation. A number of US Government-produced films are available for use by the military psychological operator. They must, however, be selected with care, as many exploit particular situations and viewpoints in a biased manner.

Advantages

Themes and objectives may be dramatized to create realism. The dramatic quality tends to cause the viewer to identify with the characters being portrayed. Thus, skillful application of production and editing techniques, such as having a central character act the behavioral patterns desired, can be very effective. The tendency to identify with the actors aids in developing a high degree of audience involvement in the PSYOP appeal.

Motion pictures gain attention, especially among illiterate groups, as illiteracy is not a barrier to understanding and use.

Most children and a high percentage of adults accept without question presumably factual information presented in films.

Sight, sound, and color reinforced by moving images elicit a high degree of interest and recall.

The motion picture is a universal communications medium, combining audiovisual features, mass distribution, and ease of presentation.

Complicated events or complex ideas can be thoroughly explained. Cartoons and other special effects can be particularly effective.

Scenes can be rehearsed and perfected prior to filming.

Newsreels that show events known to the target audience enhance the credibility of the entire PSYOP program.

Motion pictures can be rerun.

Disadvantages

The production of high-quality motion pictures is extremely expensive and requires skilled technical production personnel.

Relatively lengthy motion picture production time makes it difficult to capitalize on targets of opportunity.

Films are rapidly outdated by events, clothing, vehicles, equipment, location, or dialogue.

Viewing by target audiences may be restricted because of security considerations, local regulations, or equipment capabilities.

Diverse language differences are a major problem; these can, however, be partially overcome by use of subtitles.

Projection equipment requires electric power which may not always be available.

Film is fragile and extremely susceptible to changes in temperature and other climatic conditions.

LOUDSPEAKERS

Microphones and sound amplifying equipment transmit messages up to a distance of 800 meters. In a civilian setting loudspeakers are used to communicate with assembled groups and in localized street broadcasting. They effectively extend the range of face-to-face communications.

Loudspeakers are the most responsive medium that can be used to support tactical operations. Unsophisticated loudspeaker messages can be developed on the spot and delivered live in fast-moving situations. PSYOP loudspeaker broadcasts are usually prerecorded to insure accuracy. Occasionally, standard tapes are developed, mass produced, and distributed from the theater or national level.

Advantages

Targets of opportunity can be exploited.

Persuasive messages can be transmitted to the target as the situation changes.

Loudspeakers can be an extension of face-to-face communication.

The operator can pinpoint his target.

The target audience can be illiterate.

The loudspeaker can be used to undermine enemy morale.

Operators can be easily and readily trained.

PSYOP personnel can move to and operate anywhere a potential target audience is located.

Large, powerful, fixed loudspeakers can broadcast messages considerable distances into enemy territory.

Loudspeakers may be mounted on either wheeled or tracked vehicles.

Loudspeaker systems can be mounted in either fixed or rotary-wing aircraft. This broadens the areas accessible for loudspeaker operations. Since both types of aircraft must operate at low altitudes for the message to be understood on the ground, the sophistication and intensity of the enemy air defense are prime considerations.

Small portable loudspeaker systems may be backpacked by dismounted troops.

Disadvantages

Range is limited by humidity, wind, precipitation, vegetation, terrain, and manmade structures.

The enemy can readily take countermeasures; i.e., concentrate artillery or other weapons on loudspeaker personnel and equipment.

Messages may be forgotten and distorted with the passage of time.

PLANNING AND COORDINATION

Loudspeaker operations are conducted in coordination with and in support of tactical operations. The loudspeaker team leader must advise the commander of the supported unit as to the support the team can give. The team can then obtain essential operational information and coordinate security with the leader of the tactical unit.

For maximum results, loudspeaker messages in support of tactical operations must have shock effect. A tactical broadcast should be no longer than a few seconds, as prolonged broadcasting from a fixed position will draw indirect enemy fire. The message should be carefully prepared, so that each sentence constitutes a single, complete thought that will not be misunderstood. The key sentence should be short and repeated for emphasis.

The size of the target area, the character and loudness of competing sounds, the terrain, and climatic conditions (humidity, wind, temperature, etc.) affect reception of loudspeaker messages. Sound travels better at night in low temperature and humidity. In hilly or mountainous terrain, echoes may interfere with clear reception. Jungle and heavily vegetated areas absorb sound. Sounds projected over water or low-lying coastal plains travel great distances.

The announcer, generally indigenous to the operational area, must have idiomatic language fluency. Defectors may be used. They will know the current slang, topics of interest, and the problems of the enemy soldier. Their messages, however, must always be prerecorded and checked prior to being broadcast. The announcer must have—

- An intimate and detailed knowledge of the customs, folklore, and speech habits of the audience.

- The ability to adapt script and presentation to the changing situation.

- A vigorous, unemotional delivery.

- An understanding of the military situation and its implications.

Broadcasting messages from aircraft is an effective way to reach an otherwise inaccessible audience. Some general considerations are:

- The PSYOP unit is responsible for the premission briefing of the aircrew. This briefing covers target location, current intelligence, total time required over the target, the length of the message, and the number of repetitions desired.

- The loudspeaker message should be no longer than 20 seconds so that the entire message is audible to the audience.

- Rotary-wing aircraft use banks of speakers mounted either internally or externally on the aircraft. The most effective altitude for a hovering rotary-wing aircraft is between 900 and 1,200 meters (3,000 and 4,000 feet) above ground level (AGL). The banking or orbiting course is effective at altitudes from 600 to 900 meters (2,000-3,000 feet) AGL. The presence and capabilities of enemy ground fire will determine whether to use these patterns or whether to use aerial loudspeakers at all.

The US Air Force has primary responsibility for aerial loudspeaker operations from fixed-wing aircraft.

An adapter system has been developed that permits the connection of the airborne loudspeaker system with the intercommunications and radio system of the aircraft. This allows a signal received by the aircraft from a ground radio transmitter to be rebroadcast to the target audience. The use of this system permits a language-qualified speaker in a central location to support widely dispersed ground elements. The device can be connected to a tape recorder to record the message for future use.

RADIO

Radio broadcasts can be transmitted to local audiences, or across national boundaries, and behind enemy lines. Political boundaries or tactical situations may hinder radio broadcasts, but they are not complete barriers. Since radio can reach mass target audiences quickly, it is useful for all types of psychological operations. Where radio stations are not common and receivers rare or nonexistent, receivers may be airdropped or otherwise distributed to key communicators, public installations, and selected individuals. Public listener systems may also be set up.

Advantages

Speed	Radio programs can be quickly prepared for broadcast. This is important when attempting to capitalize on targets of opportunity.
Wide coverage	Radio programs can reach members of large and varied audiences simultaneously.
Ease of perception	It requires little or no effort to visualize the radio message. Illiteracy does not prevent the listener from forming his individual image as he listens.
Versatility	Radio is easily adaptable to drama, music, news, and other types of programs.
Emotional power	A skilled radio announcer can exert tremendous influence on the listener simply with pitch, resonance, inflection, or timing.
Availability of receivers	Where availability or ownership of receivers is common, listening to radio is a habit. Ownership of receivers has increased greatly with the invention of transistors.

Disadvantages

Enemy restrictions	The target group may be subjected to severe censorship, thereby reducing the effectiveness of radio broadcasts. Some countries have only single channel radios with the frequency set to the government-owned station.
---------------------------	--

	In some areas central receivers are connected to household receivers to control listening.
Jamming	Jamming may prevent the target group from receiving radio broadcasts.
Technical	Signal may be made inaudible or distorted by fading or static due to unfavorable atmospheric conditions.
Lack of receivers	In certain areas, so few receivers are available that radio may not be an effective medium.
Fleeting impressions	Oral media do not have the permanency of written media. Messages may be quickly forgotten or distorted.

PROGRAMING

Radio programing consists of planning the schedule, content, and production of programs during a stated period. Words, music, and sound effects are put together in various ways to produce the different kinds of programs. Some of the major types of radio programs are:

Straight news reports (without commentary).

Musical (popular, folk, classical).

Drama.

Speeches, talks, discussions.

Sports.

Interviews.

Special events; i.e., on-the-spot coverage of an election or the arrival of an important visitor, etc.

Religious.

Variety, a combination including music, skits, comedy, vaudeville, etc.

Announcements.

PRINCIPLES

Regularity	Regularity is an essential element of programing. The radio programmer must create habitual program patterns in order to build a regular audience. Content, style, and format should follow an established pattern.
Repetition	Repetition is necessary for oral learning; therefore, key themes, phrases, or slogans should be repeated.
Suitability	The radio program must suit the taste and needs of the audience. Program style and format should follow the patterns to which the audience is accustomed.

Exploitation of censorship	Discussion or presentation of banned books, plays, music, and political topics is readily received by the audience. The same is true for news withheld by censors. In breaking censorship, the psychological operator must be certain that the reason for censoring the items was political and not moral.
Voice	Having announcers with attractive voice features is essential to successful radio operations. The emotional tone conveyed by the voice may influence the listener more than the logic of arguments. Announcers whose accents are similar to those of unpopular groups should not be used. Female voices are used to exploit nostalgia, sex frustration, or to attract female audiences. However, in some parts of the world, due to the status of women, female voices are resented.

CLASSIFICATION

Programs are classified according to content, intent, and origin.

Content	The most common and useful radio program classification is by content. News reporting, commentaries, announcements, educational or informative documentaries, music, interviews, discussions, religious programs, drama, and women's programs are the most common examples.
Intent	Classification by "intent" is useful in planning to obtain a desired response with a particular broadcast(s). Programs are produced to induce such emotional reactions as confidence, hope, fear, nostalgia, frustration, etc.
Origin	Classification by "origin" pertains to the source of the message; i.e., official, unofficial, authoritative, high military command, political party, etc.

FORMAT

Format is the arrangement of the various segments of a program. A fundamental principle in preparing scripts for broadcasting is to standardize as much as possible without losing flexibility. A standard or familiar manner of presentation identifies a program for the viewers, helping to gain a regular audience. The format for a series of programs is usually established before the first program is broadcast. Radio station personnel, when establishing the format, should bear in mind that they must adhere to the highest professional standards of scriptwriting.

PROGRAM BUILDING

The essential factors of program building are:

Purpose

The writer's first concern is the purpose of the program. What is it to accomplish? Careful construction of the purpose statement of the program will aid in structuring the program and provide a measuring device to determine if the goals are being met.

A credible program requires extensive research. Thorough research of a subject uncovers and provides hidden color and details which add a note of authority to the narrator.

Testing

The script is not completed when the last page is written; the announcer (or actor) must read it aloud (rehearse it) to determine how it sounds.

SCRIPTWRITING

Principles

Aural medium

The special characteristic of radio is that it is entirely an aural medium. Radio depends entirely on the ear and must work completely on the image inspired by the sound waves coming from the speaker system.

The sound of a voice (or music) in a radio presentation raises a particular image in the listener's mind. Radio scripts must make clear to the listener the scene or idea desired by the psychological operator.

Power of suggestion

The mind of each listener is a vast storehouse of scenery. The radio writer, through speech, music, and other sounds, enables the listener to visualize each scene.

Freedom of movement

The radio scriptwriter can change scenes as frequently as desired. He can rapidly take his listeners from one event or point on earth (or in space) to another--its all in the mind.

Conflict

Conflict is the attention-getter in a radio script, gaining and increasing audience interest. Conflict is the hero against the villain, good versus evil, the struggle for survival, etc., with the psychological operator offering the solution by way of his script(s).

TECHNIQUES

The imaginative application of techniques is a way to success. The writer must be constantly alert for new ideas and be willing to experiment with variations of old established techniques. The techniques discussed below apply equally to the preparation of scripts for television and loudspeaker operations.

Simplicity	Use simple sentences and words commonly used by the target audience. However, sentence length should be varied to avoid a singsong or monotonous effect.
Conversational style	Write news in a popular, informal, relaxed style. The listener should not be aware that the news is being read to him.
Speech speed	The normal rate of speech will vary among announcers. The scriptwriter should time the rate of speech of each announcer in the language used and tailor the script to gain maximum impact in the allotted time.
Initial attention	As the listener may be running the risk of severe punishment for listening to a forbidden broadcast, the broadcast must gain instant attention. The initial part of the script should convince the listener that the program will be of interest to him. Therefore, the essential facts need to be in the first few sentences to gain interest and to insure that nothing of importance is lost if the program is jammed.
Pacing and timing	Pacing refers to the changes in quality, emotion, thought, or feeling written into the program by the scriptwriter. Timing is controlled by the director and is a shift in the speed of message delivery.
Tongue twisters	Avoid words that successively begin with the same sounds, such as "In providing proper provisional procedures . . ." Avoid words ending in "ch," "sh," "th." These sounds generally produce a hissing noise.
Numbers	Round numbers off, unless the specific number is important. For example, 20 thousand may be used instead of 20,158. Large numbers should be written in the manner easiest to read: one billion 200 million 50 thousand instead of 1,200,050,000.
Unfamiliar names	Avoid beginning a news item with a name that is unfamiliar to the target audience. Introduce the names as "The chief of police, Mr. Jones . . ."
Quotes	The listener cannot see quotation marks. By voice inflection, the announcer can make it clear when a quotation begins and ends. Other methods may be used to indicate a quotation: In Smith's own words . . . To quote Smith . . . As Smith states . . .
Punctuation	Ordinary punctuation marks are ignored in scriptwriting. They can, however, be used as a guide for the announcer. For example, parentheses may be used to set off a phrase. Key words should be capitalized for emphasis. Phonetic spelling may be used to help the announcer with difficult words.

Profanity and horror

The announcer, speaking as a representative of his government and in keeping with the image of the serious, sincere spokesman, will not use profanity in his broadcasts. He will not use horrible descriptions of human suffering, although objective reports have a legitimate place in radio.

Abbreviations

Conventional abbreviations are seldom used. In scriptwriting "Mister" is used instead of "Mr." Any abbreviations used must be familiar to the target audience.

MONITORING

Radio monitoring provides information to the PSYOP current intelligence team on:

- The enemy's domestic and foreign propaganda programs.

- The propaganda the enemy aims at his own military forces in the field.

- Propaganda directed at our forces, and the necessary countermeasures which can and should be taken.

Radio monitoring also provides information for evaluating the effectiveness of US and allied PSYOP. The frequency band is scanned on a random basis to intercept other broadcasts of interest to the US and allied forces.

Operational rules require monitoring personnel to:

- Be objective when giving the monitoring reports.

- Be familiar with the names of persons and places likely to appear in the monitored broadcast.

- Monitor only the station(s) to which assigned. Scan the frequency band only when directed.

- Record the identity of the monitored station, the date and time, and other relevant information pertaining to the monitored broadcast.

- Bring significant information to the attention of superiors immediately. Do not wait to make a scheduled report.

- Use phonetic spelling when in doubt as to the spelling of strange names and places.

TEAM IC, MOBILE RADIO ENGINEER (RADIO TRANSMISSION)

Using the AN/TRT-22, with a general broadcast radius of about 100 miles (160 km), the IC team transmits radio programs in support of psychological operations. The team also performs direct support maintenance on organic communications-electronic equipment. It is capable of multishift operations.

The first consideration in placing the radio transmitter is operational effectiveness. In a wartime environment, consideration also must be given to enemy destructive operations, particularly local actions; e.g., placement of satchel charges, bangalore torpedoes, etc. This requires that not only must antennas be placed where they will operate effectively, but they must also be reasonably near transportation, sources of supply, and troops who will assist in affording protective security.

Reasonable nearness to transportation, engineer, and signal units merits priority consideration because:

The IC team is only 40 percent mobile with organic vehicles.

Movement of equipment--e.g., generators--may require use of heavy vehicles and equipment, such as cranes, wreckers, lowboys, or mobilizers, not available in PSYOP units.

Engineer and signal personnel are needed to erect, maintain, and dismantle the 250-foot (76 meters) antenna used with the AN/TRT-22 radio transmitter.

There is a recurring need for generator fuel, spare parts, and maintenance in addition to other recurring requirements.

Gaining the attention of a PSYOP target audience, building its interest, and ultimately influencing its emotions, opinions, attitudes, and behavior, is not done quickly. Thus, the transmitter must remain on site for an extended time. In fact, in a conflict environment movement is so infrequent as to pose no burden on units needed to transport equipment.

Chapter Eighteen

PRINTED MATERIAL

18

Printed material, which includes leaflets, newspapers, posters, handbills, books, magazines, and such items as novelties, trinkets, and gifts with messages printed on them, is major means of conveying propaganda. A propaganda message printed on substantial material is a relatively permanent document. Once printed and delivered, it can be retained and readily passed from person to person without distortion.

18

A properly developed and designed message (shape, color, format, texture, and other physical characteristics have been duly considered) can have a deep and lasting effect on the target audience.

ADVANTAGES

The printed word has a high degree of acceptance, credibility, and prestige.

Printed matter is unique in that it can be passed from person to person without distortion.

It allows for the reinforcing use of photographs and graphic illustrations which can be understood by illiterates.

It is permanent and the message will not change unless it is physically altered.

It can be disseminated and read or viewed by a larger, widespread target audience.

It can be reread for reinforcement.

Complex and lengthy material can be explained in detail.

It can be hidden and read in private.

Messages can be printed on almost any surface, including useful items.

Printed material can gain prestige by acknowledging authoritative and expert authors. This is particularly important in those societies where the printed word is authoritative.

DISADVANTAGES

A high illiteracy rate reduces the effectiveness and usefulness of the printed message.

Printing operations require special, extensive, continuing logistical support.

Dissemination is time-consuming and costly, requiring the use of special facilities and complex coordination.

As printed material must be physically delivered to the target audience, the enemy can prevent or interfere with its dissemination.

It is less timely than other means of communication.

It can be collected and destroyed by the enemy.

It can be altered by overprinting.

Where prohibited, it can readily be uncovered by search and stringent penalties imposed for possession.

Development and design of effective printed material requires trained and knowledgeable personnel.

PRINTED MATERIAL TECHNIQUES

Do's

Compile catalogs of printed material and make known their existence.

Use illustrations. They increase the attractiveness of the item, arouse the attention of the target audience, and convey meaningful information in a relatively small space. Illustrations are valuable when they enhance the printed message. The best illustrations are clear and appropriate. Use illustrations that show action.

Use photographs instead of sketches whenever possible (except when a sketch, e.g., a cartoon, a caricature, etc., will best evoke a desired emotion within the target audience). People regard photographs as positive proof of events being depicted. Thus, credibility can be markedly enhanced by using photographs of the actual scene or person rather than an artist's conception. Use sharp photographs; out-of-focus or blurred photographs reduce audience interest and the credibility of the message.

Use letters. Letters obtained from defectors, prisoners of war (always adhere to the Geneva Conventions), and other former enemy personnel can be extremely effective. There are, however, a few rules that should be followed:

Do not write letters for someone else. A letter that sounds as though it were written by other than the signing party has no credibility.

You may suggest possible themes and specific details, but the letter must be written by the signator.

Among some audiences poetry can be an effective medium for emotional and sentimental appeals. Good poetry elicits highly favorable reactions, but bad poetry elicits unfavorable reactions. In order to assure quality, well-known, popular poets should be employed.

Don'ts

Do not use long text (particularly in leaflets, posters, and handbills). People in enemy-controlled territory may have to read the printed item surreptitiously. A lengthy text increases the possibility of discovery and reduces the likelihood that people will risk reading it. Long texts discourage the average reader, and the poorly educated may not even try to read lengthy items.

Avoid small print; it discourages readers. Size of print must permit the message to be read immediately.

Avoid duplication of material. Issue only the superior product.

Do not distribute obsolete propaganda. Many printed items have a period of maximal impact. If distributed after the time for which they were meant, the impact may be minimal, nil, or adverse. Therefore, carefully watch for and do not reorder obsolete items (leaflets, posters, etc.).

LEAFLETS

A leaflet is a written or pictorial message on a single sheet of paper. It has no standard size, shape, or format. In selecting the size, shape, and weight of the paper, the primary consideration is that the paper accommodate the message and be easy to distribute. The recommended size, provided the message can be accommodated, is a 15.24 centimeters by 7.72 centimeters (6 by 3 inches) on 7.25- or 9.06- kilogram paper (16- or 20-pound). Leaflets of this size and weight have very favorable aerial dissemination characteristics.

FIGURE 18-1
SAMPLE LEAFLET

Categories of Leaflets

Leaflets may be categorized as persuasive, informative, and directive.

The persuasive leaflet attains its objective through use of reason. Facts are presented so that the audience is convinced that the conclusions reached by the propagandist are valid.

The informative leaflet is factual. In presenting facts previously unknown to the audience, it attracts a reading public by satisfying curiosity.

The directive leaflet directs action when intelligence indicates the target is receptive. It is used to direct and control activities of underground forces. It may be used to disrupt enemy production by giving advance warning of bombing attacks and suggesting that workers in enemy production facilities protect themselves by staying away from work.

During consolidation and foreign internal defense operations, directive leaflets assist in maintaining law and order and in publicizing government programs.

Leaflet Use

Leaflets are developed for specific uses, such as standard, special situation, safe conduct, and news.

Standard leaflets contain general propaganda messages intended for repeated use in all types of psychological operations. They are particularly valuable in fast-moving tactical situations when PSYOP units are unable to prepare leaflets to fit rapidly changing situations. The content of standard leaflets used in support of foreign internal defense, unconventional warfare, and consolidation operations varies widely.

Advantages of Standard Leaflets. Use of standard leaflets:

Permits rapid dissemination of a variety of propaganda messages. Leaflets are prepared in advance, stockpiled in bulk, or loaded in disseminating devices for storage or immediate delivery. This provides flexibility for the use of PSYOP at all levels of command.

Permits standardization of selected propaganda themes or messages, insuring consistency of propaganda content.

Allows cataloging. Standard leaflets are easily cataloged. The availability of catalogs of standard leaflets simplifies the task of integrating selected leaflets into tactical operations.

Permits the most efficient use of large, high-speed presses at theater Army level and maximum use of commercial facilities.

Permits a joint production agency to better control printed propaganda materials.

Allows pretesting well in advance of dissemination.

Insures continuation of the PSYOP effort even though reproduction equipment may be destroyed or temporarily disabled.

Disadvantages of Standard Leaflets:

Standard leaflets are usually less effective than leaflets tailored for a specific action or situation.

They are subject to deterioration.

Circumstances and conditions make them obsolete.

Stockpiles of leaflets become a logistical burden and can be overprinted by the enemy.

They endanger enemy soldiers and civilians seen reading them.

They are instantly identifiable as a PSYOP device; therefore, the leaflet's credibility is suspect.

Contingency leaflets are prepared for an anticipated event.

Special situation leaflets are requested when the standard leaflet message is inadequate to exploit a particular propaganda opportunity, situation, or objective. They are developed when intelligence indicates the existence of a specifically exploitable,

but transient and presumably nonrecurring psychological opportunity. They are intended for use only once because the circumstances which govern their preparation are seldom duplicated.

Use in tactical operations. Tactical PSYOP achieve maximum results when leaflets have specific relevance at the moment of receipt, when psychological pressures are greatest, and when a reasonable course of action is presented. For example, surrender becomes a reasonable course of action only when under current conditions no other alternative action seems plausible.

Use in strategic operations. Strategic PSYOP are made more effective by the use of special situation leaflets that deal with specific problems and discuss them in terms of current facts. The impact is usually cumulative, rather than immediate, extending over weeks, months, or years. These leaflets are used primarily to communicate with special targets, such as foreign workers in enemy or occupied countries, ethnic or religious groups, members of a particular industrial facility or industry, and friendly resistance groups.

Operational considerations. The following operational considerations should determine the use of special situation leaflets:

- Serve as a means for timely exploitation of psychological opportunities.

- Serve as a means to communicate more intimately with the target audience and permit the message to be more precisely slanted to the immediate and particular needs of the audience.

Physical Characteristics of Leaflets

Leaflet production is affected by the physical characteristics of paper, such as shape, texture, quality, size, and weight. Legibility and color reproduction are noticeably affected by paper quality and texture. A high grade of paper is needed for correct color reproduction. Quality also affects durability. **Safe conduct passes should always be printed on durable, high quality paper.**

The major factors involved in selection of paper weights and leaflet sizes are:

- Message length.

- Artwork required.

- Delivery system to be used.

- Press capabilities.

- Purpose of the leaflet.

Format

Although leaflets generally are small, they should contain comparatively large print, particularly when directed toward the enemy. However, a small leaflet with large print makes it necessary to use a text that is brief, to the point, and immediately attractive.

Since enemy personnel and civilians in areas under enemy control are prohibited from picking up or reading leaflets from external sources, the large print enables them to read the message without touching the leaflet. In case the reader wishes to hide the leaflet and read it surreptitiously at a later time, a small leaflet is more easily concealed.

Sequence	The order of presentation must be carefully planned and appropriate for the cultural reading habits of the target.
Headline	The headline is important because it summarizes the entire leaflet and is the part of the text that first catches the eye.
Subheadline	Subheadlines are used to introduce separate paragraphs and highlight the significant points of the message.
Text	The text must be simple and to the point, containing only one theme. The first sentence should contain the substance of the message. Credible and verifiable facts should follow.
Photographs and illustrations	Since photographs and illustrations carry a message, they must be arranged and numbered in a culturally logical sequence. For example, in some cultures the sequence of reading is from right to left, in others from top to bottom and right to left. Placing a number in front of the caption which accompanies a photograph or illustration makes it easier for the reader to follow the sequence.
Captions	Caption all photographs and illustrations. If this is not done, the reader may not understand the point the message is trying to make.

LEAFLET DISSEMINATION

Printed material is the one medium that must be physically delivered to a target audience. This presents problems when attempting to disseminate printed propaganda in enemy-held territory. In denied areas, printed propaganda is generally disseminated by air delivery, line-crossers, military patrols, or international mail.

The method of delivery depends upon a variety of factors, such as:

- Political conditions.**
- Military situation.**
- Target density and population patterns.**
- Number and size of leaflets to be delivered.**
- Enemy countermeasures.**
- Availability of ordnance and delivery devices.**
- Weather.**
- Allocation of air sorties for leaflet missions.**

Air-to-Ground Delivery

Paper quality affects the drift of airdropped leaflets. If a leaflet, which offers little or no wind resistance, is dropped from a flying aircraft, it will be blown at about the same speed and direction as the wind. If there are updrafts or downdrafts, the leaflet will still follow the general direction of the wind. In areas of no turbulence the constant pull of gravity acting upon the leaflet will cause it to fall at a fairly constant rate. (See figure 18-3, Leaflet Patterns, and figure 18-4, Detailed View of Leaflet Patterns.)

AUTOROTATING MOTION

FIGURE 18-2
LEAFLET MOTIONS

FIGURE 18-3
LEAFLET PATTERNS

FIGURE 18-4

DETAILED VIEW OF LEAFLET PATTERNS

Leaflet density. The basic objective of leaflet drops is to place sufficient leaflets on the ground to insure that every member of the target audience will see (not necessarily possess) a leaflet. To insure that members of the target audience chance upon leaflets, their location and activities must be considered. Target mobility has a great bearing on the number and density of leaflets dropped and on the area that must be covered.

If the target is a soldier dug in a defensive position, his mobility and the possibility that he will find a leaflet are reduced. This type of target requires more leaflets than one consisting of rear area soldiers with greater mobility.

In mountains or jungle areas, mobility is generally restricted to roads, paths, and trails. Leaflets should be concentrated in these areas to increase the possibility that the target will chance upon them.

An urban population will require more leaflets than the population living and working in open rural terrain. The density of leaflets disseminated over a city should be heavy because a great percentage of leaflets will land on inaccessible rooftops.

As a "rule of thumb," the psychological operator should trade lower densities for greater area coverage. Villages and hamlets should be targeted so leaflets will land not only in the village where people live, but also in the fields where they work. Trails in and out of the area should be targeted.

Airdrop by hand (low altitude)

In areas where low-level delivery is feasible, leaflets can be dropped by hand through aircraft doors, ports, or specially fabricated chutes as the delivery aircraft passes over or circles the target area.

FIGURE 18-5
USE OF CHUTES IN
LOW-ALTITUDE AIRDROP

Leaflets should be dropped in small quantities at very close intervals. This results in an almost continuous release of leaflets evenly distributed downwind and parallel to the flight of the aircraft. Two men can dispense thousands of leaflets per minute using this efficient, inexpensive technique.

Leaflets printed or distributed in areas of high humidity tend to stick together. Ruffling one or both ends of the leaflet stack insures complete dispersion.

High altitude free-fall

Leaflets dispensed from aircraft flying at altitudes up to 50,000 feet (15,000 meters) are carried to their target by prevailing winds. This technique is well suited for leaflet drops directed at large general target areas. It requires long-range planning and preparation to insure prompt reaction to favorable wind conditions. The advice of skilled meteorological personnel is essential throughout the planning and execution of this operation.

The characteristics of different size leaflets must be known to insure that the proper "mix" of leaflets is used to obtain dissemination throughout the target area.

Static line technique

At high altitudes the use of leaflet bundles or boxes opened by static line has proven effective. Through use of rollers on the deck of the aircraft, boxes weighing up to 50 kilograms (110 pounds) can be ejected with minimum exertion. The steps (figure 18-6) in preparing boxes for high-altitude, static line dissemination are:

Step 1. Using a punch, cut four holes about 6 centimeters by 2 centimeters (2 1/2 inches by 3/4 inch) as indicated in figure 18-6.

Step 2. Cut through the box from one hole to another as illustrated.

Step 3. Place a 5-centimeter (2-inch) wide strip of webbing through the holes. The length of webbing depends on the size of the box; it must be long enough to tie after the box has been filled with leaflets.

Step 4. Place a 10-centimeter (3-or 4-inch) strip of masking tape over the 5-centimeter wide strip of webbing.

Step 5. Cut all four corners of the box from the top to about three-fourths of the way down (or less).

Step 6. Again using masking tape, tape one strip up the cut portion and two across, as illustrated.

Step 7. After filling the box with leaflets, tie the two strips of webbing.

Step 8. Attach one end of the static line to the webbing ties. The length of the static line depends upon the type of aircraft, but it is normally about 4 1/2 meters (15 feet) long.

FIGURE 18-6

METHOD OF FABRICATING BOXES FOR HIGH-ALTITUDE STATIC LINE DISSEMINATION

The box is rolled out of the aircraft, and as the container comes to the end of the static line, the sides of the box split. In effect, it is turned inside out and the leaflets fall away followed by the empty box.

Balloon Operations

Balloon operations, useful for penetrating denied areas, can be conducted up to a range of 2,400 kilometers (1,500 miles). As the use of balloons for other than random drops requires a knowledge and study of wind patterns and air currents from the proposed launching site to the intended target area, a meteorologist must be available from the planning to the launching stages of the operation.

Types of balloons

Balloons are made of paper, rubber, or polyethylene.

Inflation and launching

Balloons should be inflated in an area protected from the elements and launched in winds of 5-7 knots. For safety, helium is preferred; however, hydrogen, a highly inflammable (explosive) gas, will support a slightly heavier load. **Extreme care is required when hydrogen is used:** The crew must wear protective cotton clothing and goggles; no silk, fur, nylon, or other potentially spark-producing clothing may be worn; all inflation equipment must be electrically grounded; and smoking is prohibited.

Other lighter-than-air gases, such as coal gas, may also be used.

Flight

Flight patterns are determined by the weather, wind, air currents, and gas pressure. Flight pattern tables showing altitude, time, distance, payload, and gross load are easily constructed. However, the slightest leak in the balloon will alter the flight pattern.

Tracking

Balloons can be radar tracked for about 40 kilometers (25 miles) by adding a conventional reflector. This distance is enough to establish wind patterns and trajectory.

Payload

Although the maximum payload is 9 kilograms (about 20 pounds), balloons are an inexpensive means of disseminating leaflets.

Coverage of the target

The actual leaflet impact area may vary from that predicted by as much as 10 percent. This does not mean failure, because the dimensions of the leaflet pattern will be large enough to assure substantial coverage of the chosen target.

Remotely Piloted Vehicles (RPVs)

Remotely piloted vehicles are capable of conducting a variety of combat missions including leaflet delivery, surveillance, reconnaissance, electronic warfare, and strike. The remote pilot is able to detect and identify targets, change the course of the RPV, and make decisions to initiate and terminate operations in the target area. **Pinpoint accuracy is possible.**

Use for leaflet drops

RPVs can be flown into enemy territories where the gun and missile antiaircraft defenses are very intense and the losses of manned aircraft might be unacceptable. RPVs similar to those used by the US Air Force for low altitude operations are readily adaptable to leaflet delivery for psychological operations. The RPVs can fly a preselected course at heights as low as a few hundred feet above ground level. The maximum speed will vary from Mach 0.8 for the clean configuration down to about Mach 0.6 when wing pods are installed. **These RPVs can be fitted with modified wing pods providing a large leaflet capacity per mission.**

Launching

Remotely piloted vehicles can be either ground or air launched, resulting in very flexible mission planning. Recovery of the RPVs is accomplished by a parachute system.

US Army variable speed training target

Smaller target drones, such as the US Army's new variable speed training target (VSTT), can be adapted for leaflet dispensing. Since these drones are smaller than the Air Force RPV, they are more easily adapted for short-range operations with the Army in the field.

Leaflet Bomb

The M129E1 leaflet bomb is an Air Force item, obtained through Air Force ordnance channels. Its empty weight is about 52 kilograms (115 pounds) and when loaded with leaflets, approximately 100 kilograms (225 pounds). It can carry approximately 30,000 13 x 20-centimeter (5 1/4 x 8-inch), 16-pound, machine-rolled leaflets. The maximum inside diameter of the bomb is 39.4 centimeters (15 1/2 inches); the minimum is 34.3 centimeters (13 1/2 inches).

FIGURE 18-7

LEAFLET BOMB

Because of the internal configuration, the method for loading 13 x 20-centimeter (5 1/4 x 8-inch) leaflets is to use six 36-centimeter (14 1/2-inch) diameter rolls and one 32-centimeter (12 1/2-inch) diameter roll. Before the leaflets are placed in the bomb, the detonating cord is placed in the seam between the two halves.

The bomb is fuzed and armed at the launch base by Air Force or Navy personnel. When the bomb is released, the fuze functions at a predetermined time, detonating the primer cord separating the two body sections, detaching the fins, and releasing the leaflets.

Surface Delivery

The ground patrol is a useful element for disseminating small amounts of printed material behind enemy lines. Posters, leaflets, pamphlets, kits, and novelties may be placed or scattered by patrols and reconnaissance elements, usually while on regular missions.

Leaflets, posters, and propaganda items can be left behind during retrograde movements.

Infiltrators, line-crossers, and sympathizers can be used to distribute printed propaganda behind enemy lines. They frequently distribute gray or black propaganda.

Propaganda may be mailed to selected individuals or organizations through enemy or neutral postal systems.

In FID situations all agencies of the supported government and civilian public service organizations (to include the religious community) should be used as outlets and distribution points.

Seaworthy containers are easy and inexpensive to use as sea floats. Propaganda is placed in a waterproof container and dropped at predetermined locations at sea, in rivers, or streams. However, access to reliable hydrographic data (prevailing winds, tide, and currents) is needed in order to plot projected courses accurately. Containers may be made of wood, bamboo, glass, plastic, rubber, or similar material. Inexpensive plastic or cellophane envelopes can be profitably used for large-scale float operations. Large-volume dissemination is necessary because a great number of the containers will never reach the designated target audience.

FIGURE 18-8

EXAMPLES OF SEA FLOATS

POSTERS, MAGAZINES, BOOKS, BANNERS, GIFTS, PERSONAL DISPLAY ITEMS

Other types of printed matter known as slow media are also used in psychological operations. These media include posters, pamphlets, books, magazines, reprints, gifts, and other items that contain printed messages. These materials are used primarily in populated and heavily traveled areas.

Posters

Posters include all single-sheet printed and graphic (illustrations, sketches, photographs, and symbols) materials which impart a message by being publicly posted. They are used to inform; their ultimate purpose is to enlist support. The message is generally emotionally colored, intended primarily to influence emotions and gain emotional support.

Posters are a universal medium, easy and inexpensive to produce and place--almost any surface is suitable. Since they present their message pictorially, they have a universal audience that includes illiterates. Properly placed, they cannot be avoided. When placed where people congregate, they stimulate discussion, broadening the impact of the message.

Since the opinions of neutral or other noninvolved foreign audiences may affect the courses of action of the enemy government, its security forces, or its allied and assisting government, posters should be made interesting and appealing to these foreign audiences.

Basic principles

Format.

Use formats, art styles, and forms that are familiar to and appropriate for the target audience. If possible, produce an art form that people want to possess and display.

Graphics.

Give maximum space to simple graphic productions. They attract an audience and significantly increase the impact of the message. Complex graphics, on the other hand, generally confuse the audience and are subject to ambiguous and undesirable interpretations by the audience.

Photographs.

Use photographs or photomontages. People believe them. The less sophisticated the audience, the greater the belief.

Symbols.

Use symbols, inanimate and animate (including human), that are significant to the target audience. Symbols which have positive characteristics (bravery, integrity, leadership, etc.) to the target add prestige and impact to the message.

Color.

As colors have different connotations in different societies, it is important that colors and color combinations used in posters be appropriate to the culture of the target audience. Improper colors may be counterproductive or, at best, nonproductive.

Print for a moving target.

It may be necessary for people to read the unfriendly poster while on the move. Therefore, the poster should be printed in letters of a size that can be read and seen at distances from 10 to 15 meters. For example, an enemy government may impose stringent penalties on any members of its armed forces or civilian population displaying an interest in enemy posters. Or if an enemy shadow government is active and effective, a display of interest in a poster may result in loss of life or limb, injury to family, or destruction of property.

Main point.

The main point, clearly and immediately stated, should occupy the visual center of the poster so it is seen first. In addition, all textual material must relate to the main point of the message.

The appeal.

Make the appeal positive, emotional, simple, and appropriate to the action desired. The poster is too compact to present complex arguments. Do not inflame emotions to the point of violent actions when such actions are neither appropriate nor desired. Overreaction may result in loss of liberty or life and of PSYOP effectiveness.

Slogans.

Slogans reinforce the graphic art and convey emotional appeals that will be long remembered. They are extremely effective in highly authoritative societies and cultures when related to highly emotional issues. In areas of mass illiteracy those who cannot read will hear the slogans spoken frequently, ask the literates to explain them, or have readers available.

Cliches.

Cliches, catchwords, and popular and stereotyped phrases may also be featured with somewhat the same effect as slogans.

Distribution.

Posters must be distributed according to a plan. "Hit-or miss" poster distribution has no part in a poster campaign.

Placement.

Place and display posters where people naturally and habitually gather, and where they have little or nothing to do for brief periods of time; e.g., bus and tram stops, rail stations and depots, parks, outdoor cafes, etc. Posters so displayed are most likely to be exposed to an audience and read.

Viewers tend to associate the poster with the area of placement. This is one reason why posters placed in areas dangerously reached (mountainsides, railroad trestles, water tanks, high walls, etc.) evoke admiration and have a high impact. By the same line of audience reasoning, posters placed in demeaning areas lose their effectiveness.

Vulnerabilities.

Posters are subject to weather conditions. They may be easily removed, destroyed, or defaced. Outdated posters may be used in enemy propaganda. Since a weatherbeaten, obsolete, or defaced poster is a liability, remove it quickly. This requires frequent visits to poster sites.

Magazines, Pamphlets, Reprints

Magazines, pamphlets, and reprints--although differing in length, use of illustrative material, and regularity of distribution--generally have common features as propaganda media:

- All are relatively expensive to produce and distribute.

- There is no limitation as to the kind of propaganda messages they can carry.

- The audience range is unlimited--youth groups, the mass of the population, intellectuals, professionals, etc.

These materials may be dropped from the air, mailed, delivered by messenger, placed in libraries and public areas, or handed out at meetings and rallies or surreptitiously handed out. The contents may be read and discussed on radio and television.

These publications have the basic advantages common to newspapers:

- They are relatively permanent.

- A wide variety of material may be presented, such as:

 - Complex and lengthy articles.

 - Technical and professional information and data.

 - News, features, and items of popular interest.

- Material may be set in a format and edited to appeal to the complete spectrum of audience groups.

- Colorful (and colored) graphic presentations may be made.

These publications also have the disadvantages inherent in newspapers:

- Production and distribution are time-consuming, complex, and expensive.

- They are not suitable for targets of opportunity.

- If national policy or situations change, they can be reminders of past policy and situations and used by the enemy.

- Magazines and pamphlets require the services of skilled editorial and production personnel.

Books

In consolidation and FID/IDAD operations, books are valuable when available to the audience, where there is an interest in them, and time is available to read them.

Manuscripts offered for publication may indicate popular feeling concerning local conditions, the government, the military, etc.

In the early stages of consolidation of occupied areas, PSYOP units will normally assist in distributing books from US or allied sources. PSYOP personnel may also be called upon to assist in a program to rehabilitate the book publishing industry.

The use of local publishers makes it easier to establish book translation programs by publishing, in the local language and at prices within the reach of the target group, selected books of friendly persuasion. Production shortages are likely to exist; therefore, paper stocks, ink, photographic supplies, and other material must be issued on a priority basis to approved publishers, concentrating on priority subjects.

Censorship may be necessary, even of translations of seemingly harmless literature.

A well-planned book program, including children's books, is of great value, particularly in education (and reeducation) programs. Books on any subject can be provided to all target groups. Popular reading will attract the less educated groups. Other books may help to acquaint the target audience with the achievements, aims, and advantages of the programs, activities, and operations of the United States, allies, or host country. A book written by a member (or ex-member) of the target audience can be most influential.

Banners

A banner is any piece of flag-like cloth, paper, or similar surface on which a message is drawn. A banner may be any size or shape, stationary or mobile.

They generally have a one-time use in intensely emotional situations. The message is short, hard hitting, and emotional with only one theme; it may be a rallying point for adherents to a cause. Banners indicate commitment on the part of those who make or carry them.

The major advantages of banners are their symbolism and ability to rally people to a cause. Other advantages are their high visibility and mobility. Banners are a complementary medium, however, and quickly become obsolete.

Personal Display Items

Personal items such as buttons, vehicular stickers, clothing (e.g., T-shirts), or jewelry which display a belief or cause indicate a relatively high degree of commitment. If seen in public at different times and places, they give the appearance of strength for the cause the propagandist advocates. People like winners, and this appearance of strength gains adherents.

Some of the items are relatively expensive, but if attractive, they will be sold. Purchase of expensive items is an indication of strong attachment to the cause represented by the purchased item.

Gifts and Novelties

Any item of practical use may be used as a message-carrying gift; i.e., soap, matches, lighters, cigarette holders, nail clippers, notebooks, calendars, recipe books, seed packets, grocery bags, salt, or other items for which the target group has a need. Novelties such as simple games, puzzles, wall stickers, playing cards, balloons, greeting cards, and other items of no great practical use may carry messages and be distributed.

The use of novelties must be decided at the highest echelon of command because:

- They are expensive.

- They require scarce resources.

- Distribution must be phased into the overall psychological operation.

Gifts, being useful items, do not serve well for propaganda, for the impulse of the recipient is to use the gift, ignoring the message. Gifts small in size need only be stamped with or contain the known symbol of the donor, a slogan, or a brief message. Gift wrappings or containers are also excellent media for messages, symbols, or slogans.

Normally, action messages should be avoided on gifts. An urgent warning or demand for serious sacrifices should not accompany trivial gifts.

The receipt of a useful or amusing item places the recipient in a receptive frame of mind for an accompanying propaganda message.

The major disadvantage of novelties and gifts is the cumulative expense of mass production and distribution. In addition, such items have only a peripheral, passive effect, seldom if ever moving people to action or changing opinions or emotions. At best, such items complement other media.

APPENDIX B

DETAILED BREAKDOWN OF TEAMS

HEADQUARTERS AND ADMINISTRATIVE TEAMS

Team AA, Command and Control (Company).

Capabilities: Command, administrative control, and operational supervision of one to seven platoons or teams. Operates independently as liaison detachment. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per division, separate brigade, task force, MAAG, mission, or equivalent sized command; one per PSYOP liaison requirement.

Mobility: One hundred percent mobile in organic vehicles.

Team AB, Command and Control (Battalion).

Capabilities: Command, administrative control, and operational supervision of two to five PSYOP companies; logistical and administrative support for assigned and attached units; limited procurement and distribution of nonstandard items of equipment and supplies for subordinate operational elements. Operates independently as a liaison detachment. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per army component of a subordinate unified command, corps, civil affairs or military police prisoner-of-war command, or equivalent sized command or as required; one per PSYOP liaison requirement.

Mobility: Thirty-two percent mobile in organic vehicles.

Team AC, Command and Control (Group).

Capabilities: Command of two to five PSYOP battalions; coordination and operational supervision of subordinate elements; specified elements parachute qualified when supporting an airborne unit.

Basis of Allocation: One per theater army, army component of a unified command or corps.

Mobility: Thirty-seven percent mobile in organic vehicles.

Team AD, Command Assessment.

Capabilities: To deploy with a corps deployment package into a hostile area, and analyze and evaluate the psychological warfare possibilities. To make recommendations to ground force commander in the area of psychological operations. To determine what psychological functional teams should be deployed into the area. To evaluate the results of any psychological campaign that had been conducted prior to insertion. To plan the use of themes to be used in a PSYOP campaign.

Basis of Allocation: One per corps deployment package.

Mobility: This team has no organic TOE equipment requiring transportation. Non-TOE equipment and supplies constitute approximately 300 pounds (20 cubic feet).

SUPPLY AND MAINTENANCE TEAMS

Team BA, Supply and Maintenance.

Capabilities: Plans and coordinates logistical requirements for PSYOP units and teams; procures and distributes standard and nonstandard items of equipment and supplies; this team has a minimum vehicle maintenance capability to support PSYOP companies and teams.

Basis of Allocation: One per PSYOP company or separate teams as required.

Mobility: Sixty-seven percent mobile in organic vehicles.

OPERATIONAL TEAMS

Team FA, Propaganda.

Capabilities: Supervises the production of, or develops, propaganda; controls propaganda development activity supporting theater army, corps, division, MAAG, or mission. Operates independently as a liaison detachment as required. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per two to eight Teams FB, FC, FD, or FE, as required; one per major command; one per PSYOP liaison requirement.

Mobility: One hundred percent mobile in organic vehicles.

Team FB, Audio and Television Production.

Capabilities: Prepares audio and television propaganda in the form of sound tapes, scripts, news, commentary, and entertainment programs for dissemination to target audiences by radio, television, and loudspeaker; researches, locates, procures, and records indigenous music and sound effects. Requires augmentation by indigenous linguists. Must be employed with Team ID, Mobile Radio Production, when not operating in a fixed facility.

Basis of Allocation: One or more per propaganda development activity, as required; one or more per Team IA, Mobile Radio Operations, as required; one per ethnic group targeted or geopolitical area of interest.

Mobility: One hundred percent mobile in organic vehicles.

Team FC, Current Intelligence.

Capabilities: Develops intelligence requirements and processes intelligence information to support psychological operations; analyzes current intelligence to determine and verify psychological susceptibilities, vulnerabilities, and opportunities; interrogates prisoners and translates foreign language printed material. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per PSYOP company, battalion, or group as required; one per major enemy unit, ethnic group, targeted, or geopolitical area of interest.

Mobility: One hundred percent mobile in organic vehicles.

Team FD, Research and Analysis.

Capabilities: Performs detailed background study and analysis of specific target groups, prepares PSYOP contingency plans, conducts propaganda analysis of friendly and enemy PSYOP. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per PSYOP group or battalion as required.

Mobility: Fifty percent mobile in organic vehicles.

Team FE, Graphic Production.

Capabilities: Prepares copy and illustrations necessary to produce leaflets, posters, pamphlets, and newssheets. Parachute qualified when supporting an airborne unit. Requires augmentation by indigenous writers and illustrators.

Basis of Allocation: One per PSYOP group or battalion as required; one per PSYOP unit with organic, medium, or heavy printing platoon.

Mobility: Fifty percent mobile in organic vehicles.

Team GA, Light Printing.

Capabilities: Prints propaganda leaflets and newssheets on organic presses. Trims, cuts, packages, rolls, and distributes printed propaganda material for dissemination by aircraft, tube artillery, and other means. Prepares propaganda messages for special situation leaflets and newssheets, as well as reproducing scripts for use by tactical loudspeaker broadcasts. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per PSYOP battalion or company as required.

Mobility: Eighty percent mobile in organic vehicles.

Team GB, Medium Printing (Operations, Camera and Plate).

Capabilities: Plans, controls, and supervises printing operations to produce leaflets, posters, and other propaganda materials. Supervises one to four Teams GC operating at a single location. Executes process photography and prepares photolithographic plates for use by Team GC. Provides electrical equipment maintenance and supply support for itself and attached Teams GC. Capable of multishift operations.

Basis of Allocation: One per mobile medium printing requirement.

Mobility: Fifty percent mobile in organic vehicles.

Team GC, Medium Printing (Press and Processing).

Capabilities: Prints by photolithographic process up to 1,200,000 production units per day of propaganda leaflets, posters, and other printed material to specification. Trims, cuts, rolls, packages, and distributes propaganda material for dissemination by aircraft, artillery, and other means. Provides direct and general support maintenance for organic presses when supported by Teams BA and GB and when welding and machinist support is provided from an outside source. Requires electrical power and administrative transportation support for prolonged operations. Capable of multishift operations.

Basis of Allocation: One to four per Team GB as required.

Mobility: Sixty percent mobile in organic vehicles.

Team GD, Heavy Printing (Operations, Camera and Plate).

Capabilities: Plans, controls, and supervises printing operations to produce leaflets, posters, pamphlets, and other propaganda materials. Supervises one to four Teams GE operating at a single location. Executes process photography and prepares photolithographic plates for use by Team GE. Provides electrical equipment maintenance and supply support for itself and attached Teams GE. Requires a fixed facility and outside source of power for operation. Capable of multishift operations.

Basis of Allocation: One per fixed heavy printing requirement.

Mobility: Five percent mobile in organic vehicles.

Team GE, Heavy Printing (Press and Processing).

Capabilities: Prints by photolithographic process up to 5,000,000 production units per day of leaflets, posters, pamphlets, and other printed propaganda materials. Trims, cuts, folds, stitches, packages, and distributes reproduced material for dissemination. Provides direct and general support maintenance for organic presses when supported by Teams BA and GD and when welding and machinist support is available from an outside source. Requires a fixed facility, external power source, and administrative transportation support for operation. Capable of multishift operations.

Basis of Allocation: One to four per Team GD.

Mobility: Five percent in organic vehicles.

Team HA, Platoon Headquarters (Audio and Visual).

Capabilities: Supervision of two or more Teams GA, HB, and HC, or K-Series Teams. Operates independently as a liaison detachment. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per psychological operations group, battalion, or company as required; one per PSYOP liaison requirement.

Mobility: One hundred percent mobile in organic vehicles.

Team HB, Loudspeaker.

Capabilities: Plans, prepares, records, and conducts live or taped loudspeaker broadcasts in support of psychological operations; produces limited quantity of and distributes leaflets. Loudspeaker with power source may be manpacked or mounted on ground vehicles, boats, or aircraft. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per combat battalion or as required.

Mobility: One hundred percent mobile in organic vehicles.

Team HC, Audio Visual.

Capabilities: Exhibits sound motion pictures, film strips and photographic slides; conducts loudspeaker broadcasts; produces limited quantity of and distributes leaflets; conducts face-to-face propaganda; surveys local population to secure PSYOP intelligence.

Basis of Allocation: One or more per PSYOP battalion or company; one per combat brigade or as required by the tactical or political situation.

Mobility: One hundred percent mobile in organic vehicles.

Team IA, Mobile Radio Operations.

Capabilities: Supervision of Teams IB, IC, ID, and IE when more than one team is deployed to support an operational mission. Provides user level supply support for PSYOP-peculiar communications-electronic equipment organic to subordinate teams. Requires company level administrative support.

Basis of Allocation: One per PSYOP group, battalion, or company as required.

Mobility: Thirty-two percent mobile in organic vehicles.

Team IB, Mobile Radio Monitoring.

Capabilities: Provides news from friendly and enemy radio and teletype sources including CONUS stations and theater headquarters to provide a base for selected propaganda news broadcasts or other propaganda media. Provides tape monitoring of selected broadcasts for subsequent translation and analysis. Performs direct support maintenance on organic communications-electronics equipment. Capable of multishift operations.

Basis of Allocation: One per Team ID or FC as required.

Mobility: One hundred percent mobile in organic vehicles.

Team IC, Mobile Radio Engineer.

Capabilities: Transmits medium or shortwave radio broadcasts in support of propaganda operations. Performs direct support maintenance on organic communications-electronics equipment. Capable of multishift operations.

Basis of Allocation: One per propaganda broadcasting mission.

Mobility: Forty percent mobile in organic vehicles.

Team ID, Mobile Radio Production.

Capabilities: Prepares and produces up to 8 hours of original radio programs per day in support of propaganda operations. Requires augmentation by indigenous announcers and support by Team FB.

Basis of Allocation: One or more per studio production requirement.

Mobility: Sixteen percent mobile in organic vehicles.

Team KA, Fixed Motion Picture.

Capabilities: Provides for the operation of a motion picture installation and/or the operational supervision or advisory assistance for motion picture installations operated by indigenous personnel.

Basis of Allocation: One per motion picture theater when operated by team members. One per three to five motion picture theaters operated by indigenous personnel.

Mobility: One hundred percent mobile in organic vehicles.

Team KB, Fixed Printing.

Capabilities: Provides operational control or advisory assistance for an indigenous newspaper or other type publication plant in a specific geographical area. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per publications' plant as required.

Mobility: Thirty-three percent mobile in organic vehicles.

Team KC, Fixed Radio.

Capabilities: Provides operational control or advisory assistance for an indigenous fixed radio broadcasting station. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per fixed radio station as required.

Mobility: Sixty-seven percent mobile in organic vehicles.

Team KD, Display.

Capabilities: Supervises preparation of copy and illustrations; provides control or advisory assistance for the preparation of copy, artwork, displays, bulletin boards, signs, and other graphic media. Requires augmentation by indigenous interpreters, writers, and illustrators.

Basis of Allocation: As required.

Mobility: Thirty-three percent mobile in organic vehicles.

Team KE, Fixed Television.

Capabilities: Provides for the operational supervision and/or the operation of an indigenous television broadcasting station; provides advisory assistance for television networks or stations. Provides limited maintenance and repair of a television broadcasting station.

Basis of Allocation: One per television broadcasting facility or as required.

Mobility: Fifty percent mobile in organic vehicles.

APPENDIX C

FORMAT FOR BASIC PSYOP STUDY (BPS)

CLASSIFICATION

TITLE PAGE

Indicate the target country/area.

MAP OF COUNTRY/AREA

Title of map, map number, map sheet number, and scale.

EXECUTIVE SUMMARY

The executive summary should focus on those PSYOP-exploitable vulnerabilities enumerated in the BPS. It should be written in a clear, brief, accurate, and coherent form. The summary should open with a short résumé of the area with its strategic significance and then state the PSYOP-relevant characteristics and conclusions reached in the BPS.

TABLE OF CONTENTS

See Tab 1.

INTRODUCTION

See Tab 2.

CHAPTER 1. HISTORY AND IDEOLOGY

This chapter gives a general review of the evolution of the state and its people, focusing on those aspects having psychological significance. It is not to be a detailed chronology of the country's development. However, the country's history and those factors which contribute to its formation have a preeminent relationship to the country's historical perspective, its attitudes, and its current world position.

The history chapter must be comprehensive in its "issue" orientation because of its special importance to psychological operations. An analysis of those historical issues which bear directly upon present political, economic, and military policies can provide to the operator a solid foundation for the rest of the study.

CHAPTER 2. GOVERNMENT AND POLITICS

This chapter covers the country's political system, giving a descriptive analysis of the sources of political power, the policymaking process, and the political complexities of the country's government. It should include the system's responsiveness to pressure and the system's influence on the country's politics.

When discussing politics, particular attention must be given to the role of the individuals and special interest groups or political parties in the political system. This should include the political attitudes and values of the population, their view of the political system, and the function of the government within their society.

CLASSIFICATION

CLASSIFICATION

CHAPTER 3. FOREIGN RELATIONS AND POLICY

This chapter surveys the country's foreign relations, concentrating on its political alignment in world affairs and its relationship with the United States. It describes the foreign policy of the country, but more important, it analyzes and interprets why the country acts as it does in international affairs.

This analysis and interpretation should cover those leaders who make the decisions that determine foreign policy formation and the success of their policy. This study of the foreign relations gives the psychological operator a view of the country's world position and the reasons for this position. The basis for internal support or opposition, as well as the political climate created by these policies, should be examined.

CHAPTER 4. SOCIETY AND CULTURE

This chapter is a descriptive analysis of the subject country's social setting. This analysis provides the operator with the knowledge needed to understand with whom he is to communicate in a possible PSYOP campaign. Every major aspect of the country's social dynamics which can assist in the assessment of its PSYOP potential must be analyzed.

A study of the country's social organization covers all socially transmitted cultural and behavior patterns and characteristics of the people. These include the society's social values and the role of the family. Its culture, social organization, customs, ethnic composition, and the interrelated effects of religion, language, and history should be addressed.

Associated with this structure are those social patterns of religion, culture, and education which determine the character of a society. An important aspect of the country's social condition, the status of the population's health, and those public programs (or the absence thereof) which seek to improve the general welfare may provide key PSYOP indicators. Social problems and intergroup tensions should be covered.

CHAPTER 5. THE ECONOMY

This chapter presents a brief analysis of the characteristics, structure, and dynamics of the national economy. It covers the target country's economic strengths and weaknesses, current economic and labor problems, and potential economic development.

The general description of the economy details the economic base of the country and the importance of agriculture, industry, and trade. This information is used to determine if the individual's needs are being met by the present economic structure. These economic considerations explain many of the sociological conditions of psychological importance. Of particular importance are perceptions within the society of the wisdom of policies, and how citizens individually or by referent groups stand to gain or lose by the policies.

CHAPTER 6. THE MILITARY ESTABLISHMENT

In addition to its primary function of external defense, the military establishment in most countries can be a valuable participant in, or impediment to, the country's programs of political life. Even when the military establishment is not directly involved in competition for political power, its actions and programs can have a major impact on social and political development.

This chapter is not "order-of-battle" oriented, but it should, as a minimum, analyze and provide conclusions on the following topic areas:

CLASSIFICATION

Emergence of the modern military establishment.

Military roles in the political, economic, and social spheres, and the effects of these roles.

Issues creating cohesion or conflict within the armed forces.

Internal conflicts within the military establishment.

Extent, quality, and influence of foreign military assistance.

CHAPTER 7. COMMUNICATION PROCESS AND EFFECTS

This chapter contains the information essential to understand communications patterns for the implementation of a psychological campaign. It should cover how and through what social means the people of the country communicate with one another (as distinguished from the technical data in the appendix on communications facilities). Data should include languages and language groups, nonverbal communication, and nonverbal symbols peculiar to the country's culture or cultures. It should identify distinctive styles in rhetoric or the visual arts that are significant to PSYOP, as well as dramatic, poetic, and musical forms, that could be used to inspire attitudes, emotions, and behavior desired by the PSYOP planners.

It should include data on formal and informal leadership positions in the society whose incumbents serve as key communicators and opinion leaders. An analysis of the readership and listenership habits of the society as well as an analysis of media effectiveness should also be presented. Freedom of the press issues, if any, should also be addressed.

CHAPTER 8. PSYOP, POLITICAL WARFARE, AND OFFICIAL INFORMATION

This chapter furnishes information on the propaganda conducted by or directed toward the subject country. Research personnel should examine the information efforts of the country's government and agencies, the kinds of domestic and foreign propaganda being produced for the current situation, and the political and philosophical direction of that information. A careful analysis of the effectiveness of propaganda techniques used by institutions within the society may provide useful insights for future US PSYOP efforts.

Propaganda can also come from other countries directed toward the subject country to achieve certain political aims. This chapter, therefore, should explain these foreign efforts, the media employed, to whom directed, and for what political end. Particular attention should be given to United States efforts and facilities for possible use in a future psychological campaign.

CHAPTER 9. POTENTIAL TARGET GROUPS

This chapter is the most important chapter of the BPS in that it synthesizes the most important information and applies it to the identified target groups. There are categories of information that must be used to define the psychological characteristics of each significant target group. These categories are as follows:

The attitude, past and present, and behavior of the target toward the key issues and conditions.

The accessibility of the target to propaganda, including the media to which the target is most responsive.

CLASSIFICATION

Susceptibility to persuasion. This requires a thorough analysis of the conditions and attitudes that pertain to the target. This analysis should determine what behavior patterns the target can be persuaded to adopt, what resistance must be overcome, and what the possibilities are of successful target persuasion. It is recognized that some targets may not be susceptible to any line of persuasion. Conditions change and so may the susceptibility of the target.

The **effectiveness** of the target in influencing other targets or the target's ability to take direct action to influence events. In the case of a single individual, this means how effective he is as a communicator. In the case of a group, it means what is the power of the group in relation to other groups in effecting attitude change or in taking direct action in accordance with the behavioral results desired by the psychological operator. Initially, a group's effectiveness may not be what is desired, but as the situation changes, its effectiveness may also change.

Vulnerabilities and sensitivities. From the standpoint of identifying motivating themes or themes to be avoided, it should be considered that each target will be vulnerable to certain issues and conditions just as it will be sensitive to its own values.

INTRODUCTION

() This Basic PSYOP Study (BPS) is intended to provide a summary of those aspects of (country name) that are deemed to have significance to the planning and conduct of psychological operations. The study, therefore, strives to isolate and identify those PSYOP-relevant vulnerabilities, characteristics, insights, and opportunities that are perceived by the authors to exist in (country name). It is prepared specifically as a basic source document for further development of estimates, plans, and annexes. Although this study can assist in developing concepts for contingency planning, its composition has not been tailored to the conduct of any current plan. Rather, it is intentionally a "neutral" document in the sense that its data and insights can be used with a wide variety of possible present and future political and military developments in the region.

() (Here should be inserted a paragraph which references the authority directing the study, research cutoff date, and provisions for update.)

() The format directed for use in this Basic PSYOP Study is designed in all cases to focus on the PSYOP aspects of the many topics addressed. It is intended that this document should not be viewed as a comprehensive and self-contained area study, but should instead be used in conjunction with, and as a complement to, such other standard references as the Department of the Army Area Handbook Series. In addition, the following aspects of the purpose and method of preparation of this BPS are pertinent:

a. It results from research that combines both the standard classified products of the national intelligence community and the findings of the academic social science disciplines.

b. It attempts to be more analytical than descriptive in nature and is, therefore, subject to varying individual perspectives.

c. It should be read, and its conclusions analyzed, in conjunction with other Basic PSYOP Studies prepared on (regional area).

d. It does not presume to be either a definitive statement of US foreign policy or a comprehensive and authoritative analysis of (country name), except in those specialized areas that are of direct PSYOP relevance.

() (Here should be inserted a statement of US Policy objectives toward the country in question. This information should be extracted in order of priority from the appropriate ICA Country Plan, Department of State Policy Memorandum, or similar document.)

() Research has revealed certain areas where gaps exist in material presented in this study. These gaps were occasioned by such limitations as the classification level of the BPS, availability of complete and timely information, or time constraints on the scope of the future research. Their enumeration here will hopefully aid future research and point out further inquiries to be made by users of this document.

() (Insert here those issues or BPS relevant data which could not be addressed or completely answered.)

APPENDIX D

FORMAT FOR PSYOP ESTIMATE OF THE SITUATION

CLASSIFICATION

Issuing Headquarters

Location of CP

Date/Time Group

PSYCHOLOGICAL OPERATIONS ESTIMATE OF THE SITUATION NO. ____

Reference: List maps, charts, and source documents necessary for understanding the estimate.

1. MISSION

The restated mission determined by the commander after he completes mission analysis in the sequence of command and staff actions. (See FM 101-5.)

2. THE SITUATION AND CONSIDERATIONS

a. Intelligence Situation.

- (1) Characteristics of the area of operations. Analysis of Area of Operations No. ____.
- (2) Enemy strength and dispositions. Identification of forces opposing the command.
- (3) Enemy capabilities.
 - (a) Affecting tactical mission. Intelligence Estimate No. ____.
 - (b) Affecting PSYOP activities.

b. Tactical Situation.

- (1) Present dispositions. Operation Estimate No. ____.
- (2) Possible tactical courses of action.
 - (a) Course of action one.
 - (b) Course of action two.
 - (c) Course of action three.
- (3) Projected operations.

c. Personnel Situation.

- (1) Personnel Estimate No. ____.
- (2) Critical shortages of personnel that will affect PSYOP support of the operation.
- (3) Availability of linguistic personnel.
- (4) Availability of indigenous personnel for employment with PSYOP.

CLASSIFICATION

D-1

CLASSIFICATION**d. Logistic Situation.**

- (1) Logistic Estimate No. _____.
- (2) Status of PSYOP specific equipment.
- (3) Availability of PSYOP related supplies.

e. Civil Affairs Situation.

- (1) Civil Affairs Estimate No. _____.
- (2) Disposition of CA units.
- (3) General attitude of population.
- (4) Anticipated enemy civilian personnel reactions and possible effects upon our actions.

f. PSYOP Situation.

- (1) Disposition of PSYOP elements. (Annex A--Overlay, Disposition of PSYOP Elements.)
- (2) PSYOP situation in the area of operations. Include considerations such as areas to be considered occupied and those to be considered liberated. Include any missions, directives, objectives, or guidance received from higher authority.
- (3) Requirements for indigenous personnel support.
- (4) Peculiarities of operations to be supported that may impact on PSYOP, such as planned use of nuclear weapons, possibility of pursuit or exploitation, planned use of deception measures, previous operations and their effect on enemy morale, etc.

g. Assumptions.

- (1) Approximate length of time that area should remain under control of the command.
- (2) Probable enemy PSYOP reaction to planned operations.
- (3) Other assumptions as required.

h. Special Factors. Other difficulties, difficult patterns, or considerations that may detract from or assist in the accomplishment of PSYOP objectives.

3. ANALYSIS

- a. Analyze each course of action to determine its advantages and disadvantages for the conduct of psychological operations. This is done by wargaming the course of action from the current disposition through the objective. (Annex B--Target Analysis of Enemy Forces.)
- b. The first part of the analysis is to determine those considerations or enemy capabilities listed in paragraph 2a that will materially assist in choosing the best course of action.
- c. The second step is to analyze each contemplated course of action versus the enemy capabilities. Each course of action is analyzed separately against the enemy capabilities to determine the probable psychological impact.
- d. There is no attempt to compare courses of action in this paragraph.
- e. Identify deficiencies and advantages and disadvantages of each course of action.

CLASSIFICATION

4. COMPARISON

- a. Compare the courses of action to determine which one offers the best chance of success. In the first paragraph, list the advantages and disadvantages of each course of action that affect PSYOP.
- b. Develop and compare methods of overcoming disadvantages in each course of action.
- c. In the last subparagraph state a general conclusion as to which course of action offers the best chance of success for PSYOP.

5. CONCLUSIONS

- a. PSYOP can support the operation.
- b. Tactical course of action number _____ can best be supported from resource viewpoint. Course of action number _____ provides the most exploitable PSYOP situation.
- c. Deficiencies requiring the commander's attention.
- d. Recommend the adoption of course of action number _____.

XXXX

G5

Annexes: A--Overlay, Disposition of PSYOP Elements (omitted)
 B--Target Analysis, Enemy Military Units (omitted)
 C--Target Analysis, Civilian Groups in Area of Operations (omitted)
 D--Proposed Employment of PSYOP Resources (omitted)

NOTE:

The information contained in the Psychological Operations Estimate of the Situation may be presented in either of two ways. It may be a separate PSYOP estimate as indicated in this appendix, or the considerations may be included in the Civil-Military Operations Estimate as indicated in FM 101-5. This estimate is normally the responsibility of the CMO staff officer, based on input provided by the supporting PSYOP unit.

The PSYOP staff officer in a tactical unit may also make an estimate to determine the best method for accomplishing a PSYOP task. In such a case, he may use the format for the tactical commander's estimate contained in FM 101-5. Similarly, the PSYOP unit commander or staff officer can use the combat service support commander's estimate of the situation.

APPENDIX E

FORMAT FOR PSYOP ANNEX/APPENDIX

CLASSIFICATION

Copy No ____ of ____ copies
Issuing Headquarters
Place of Issue
Date/Time Group
Message Reference Number

ANNEX/APPENDIX ____ (Psychological Operations) to OPORD No. ____.

References: Maps, charts, documents, reports, and other plans which have a significant bearing on the conduct of PSYOP.

Time Zone Used Throughout the Order:

1. SITUATION

a. Enemy Forces.

- (1) Annex A (Intelligence) to OPORD No. ____.
- (2) Psychological situation.
 - (a) Enemy military and civilian morale.
 - (b) Enemy strengths and weaknesses.
- (3) Ideological and psychological factors, favorable and unfavorable.

b. Friendly Forces.

- (1) OPORD No. ____.
- (2) PSYOP capabilities and plans of friendly forces and agencies.
- (3) Refer to command relationship agreements and to requirements for interagency support.
- (4) Periodic PSYOP Report ____.

c. Attachments and Detachments. Task organization OPORD ____.

2. MISSION

A clear, concise, and complete statement of what PSYOP is to accomplish in support of the mission stated in the basic OPORD.

CLASSIFICATION

CLASSIFICATION

3. EXECUTION

- a. Concept of Operation. Summarize the course of action and state generally the concept for the conduct and control of PSYOP. Where applicable, indicate phasing of the operation and arrangements for the transfer of operational control of PSYOP assets or the transfer of operational control of psychological operations.
- b. Tasking. By subparagraph task the major subordinate headquarters to conduct PSYOP in support of specified objectives and tasks.
- c. Target Groups. Identify enemy forces and major target groups that the operation is intended to influence or that are affected by PSYOP actions, information, and propaganda activities conducted in support of the operation. Separately identify subgroups of significance to PSYOP. Include an analysis of the vulnerabilities and effectiveness of each target group and each group's susceptibility to PSYOP. This information may be included as an APPENDIX/TAB to the PSYOP ANNEX/APPENDIX.
- d. Objectives.
 - (1) List in separate subparagraphs the officially stated US national policy objectives and the US national psychological objectives within the countries involved.
 - (2) In separate subparagraphs, state the psychological objectives that are to be achieved from the planned operation or that are to be induced in support of the action.
- e. Themes and Actions To Be Stressed or Avoided.
 - (1) Themes to be stressed.
 - (2) Themes to be avoided.
 - (3) Supportive actions.
 - (4) Prohibited actions.
- g. Coordinating Instructions. List details of coordination, control, and instructions applicable to two or more elements of the command. List procedures necessary for approval of PSYOP to be conducted by subordinate units.

4. SERVICE SUPPORT

- a. Logistics. Provide a statement of the logistical arrangements applicable to PSYOP but not covered in the basic order. This paragraph may include but is not limited to:
 - (1) Stocking of propaganda and information materials.
 - (2) Provisions for the supply and maintenance of PSYOP-peculiar supplies and equipment.
 - (3) Provisions for control and maintenance of indigenous equipment and materials.
- b. Administration. Provide a statement of administrative arrangements applicable to PSYOP not covered in basic plan. The following items may be included:
 - (1) Requirements for special reports.
 - (2) Fiscal matters relating to special funds.
 - (3) Personnel matters relating to indigenous personnel.
- c. Annex ____ (Service Support) to OPORD ____.

CLASSIFICATION

CLASSIFICATION**5. COMMAND AND SIGNAL.**

- a. Signal. Refer to appropriate annex.
- b. Command. Provide command instructions concerning command post locations. May include topics concerning relationship arrangements of nonmilitary assets available for support.

Appendixes/Inclosures:

Distribution:

NOTE: The information concerning the conduct of PSYOP may be presented as a separate appendix to the Civil-Military Operations Annex or included in the body of the CMO Annex. This is normally prepared by the CMO staff officer based on input and recommendations from the supporting PSYOP unit.

CLASSIFICATION

APPENDIX F

EXPLANATION OF TARGET ANALYSIS WORKSHEET

The target analysis worksheet (figure F-1) is a systematic method of evaluating tentative targets by relating conditions to the psychological objective. It is the basis for the Psychological Operations Campaign Control Sheet. A separate worksheet should be completed for each tentative target surfaced from the study of intelligence. When completed, each target analysis worksheet should be filed in the appropriate PSYOP workbook.

National objective: Obtain from US policy statements and documents. Sources for US objectives relevant to US Army PSYOP might be unified command military plans, ICA Country Program memorandums, Department of State and Defense policy statements, and other related command PSYOP guidances.

Mission: The mission received from the next higher headquarters or that mission which results from an analysis of the unit's general mission and the resultant PSYOP tasks.

Target: Select target based on PSYOP mission.

Conditions: Current events and environmental factors which affect the target group.

Attitude: The known attitudes of the target group relevant to the mission are listed.

Target susceptibility: Information relative to the ability to persuade the target group. Consideration is given to the unfulfilled wants, needs, and feelings of the target group. Susceptibility must not be confused with accessibility.

Psychological objective: The type of behavioral or attitudinal change desired of the target to help accomplish the mission. Psychological objectives should be stated in measurable terms. The psychological objective must be supported by information concerning target susceptibility and effectiveness.

Target effectiveness: The study of power; it deals with the target group's ability to accomplish the psychological objective.

Impact indicators: Those factors which indicate the target audience responded to PSYOP and thus fulfilled the psychological objectives. In devising the psychological objective(s), the analyst must consider questions to be answered which measure its achievement.

NOTE: Those blocks with an asterisk (*) should be cross-referenced to the appropriate section, page, and paragraph of the PSYOP workbook or other reference source. If information to support these blocks is not available, it may be necessary to submit an EEI to intelligence gathering sources.

TARGET ANALYSIS WORKSHEET

NATIONAL OBJECTIVE: To assist oppressed people in self-determination.

MISSION: (PSYCHOLOGICAL OBJECTIVE) Stimulate disaffection against government in power.

TARGET	*CONDITIONS	*ATTITUDE	*TARGET SUSCEPTIBILITY	PSYCHOLOGICAL OBJECTIVE	*TARGET EFFECTIVENESS	IMPACT INDICATORS
Dock workers in _____	Current intelligence indicates that the shortage of food in _____ has resulted in food rationing which favors government officials and deprives urban workers of all but a subsistence diet. (References:	Increasing resentment and animosity toward local bureaucrats. (References:	It should be relatively simple to communicate with this group because their basic need for food is not being effectively met. Their primary concern centers on obtaining sufficient food. They have demonstrated against the government and as a result some were killed and many imprisoned. Preferred communications are those delivered in person by an emotive orator of high prestige. (References:	Persuade the dock workers to take anti-government actions.	This group is well organized and has positive leadership. It is part of a larger union of longshoremen, a critical labor group in this country, dependent upon seaborne communications. These longshoremen have capable representation in the government. The opinions of these representatives are highly significant and are sought after by national leadership. (References:	30% increase in anti-government demonstrations by dock workers. 25% increase in dock worker absenteeism.

Figure F-1.

APPENDIX G

EXPLANATION OF PSYOP CAMPAIGN CONTROL SHEET

The purpose of the psychological operations campaign control sheet is to provide a planning guide that will assist PSYOP planners in organizing and controlling a campaign after the psychological objective(s) has been selected. The campaign control sheet format (figure G-1) is a guide and can be modified to meet local conditions and echelons of command as appropriate.

National objective: The national objective or other applicable policy guidance. This information and the mission received from the next higher headquarters should be transcribed from the target analysis worksheet.

Psychological objective: The measurable psychological objective which has been developed and which will aid in accomplishing the mission. It is stated in terms of desired action and results.

Conditions: A synopsis of the significant entries in the conditions block of the target analysis worksheet.

Target: A summary of the significant attitudes, susceptibility factors, and effectiveness which were contained in the target analysis worksheet.

Related internal development programs: The various ongoing civic action and related programs which support the achievement of the psychological objective. Planned and ongoing programs by other agencies should be noted.

Themes: The lines of persuasion selected through target analysis to be conveyed to the target audience. Care should be taken not to confuse objectives and themes. The theme is the idea to be communicated that will contribute to the accomplishment of the objective.

Campaign: The media to be used, the frequency, and duration.

Implementation: The schedule for monitoring, recording, and controlling propaganda dissemination as the campaign progresses. It reflects changes in duration, intensity, timing, and susceptibilities, and should be completed in pencil.

Campaign impact indicators: The measurable responses that demonstrate the success of the overall campaign.

APPENDIX H

PSYOP BASIC TERMS

Attitudes are positively or negatively learned orientations toward something or someone that have a tendency to motivate an individual or group toward some behavior. Experienced soldiers, for example, have negative attitudes toward slovenliness.

A Basic PSYOP Study (BPS) is a detailed background document which describes the PSYOP-relevant vulnerabilities, characteristics, insights, and opportunities that are known about a specific country susceptible to exploitation.

Culture is a generic term for beliefs, values, and behavior that are learned while symbolically interacting with other individuals or groups. Culture is shared among individuals and groups and transmitted by means of words, symbols, and actions. It is the use of these means that attaches meaning and value to things that make the human animal unique. By learning, sharing, and transmitting certain beliefs and behaviors (i.e., industrialization, democracy) and not others (i.e., agriculture, dictatorship), one culture is distinct from another.

Cultural relativism is the social science principle that no aspect of human life can be judged meaningfully outside the context of a particular society or culture.

Communication is the process of standardizing and exchanging intelligence perceptions and meanings found in the form of value statements, ideas, sentiments, beliefs, etc., using words, symbols, or actions.

Drives (i.e., hunger, thirst, and activity) are unlearned (primary) or physiologically learned (secondary) internal tensions or stimuli which dispose the individual or group to a general behavior that will satisfy a need. Drives may stimulate an individual or group to cooperation, competition, or accommodation in order to insure survival. Hunger, for example, may stimulate the individual or group to cooperate, compete, commit aggression, hoard food, or gather food.

Ethnocentrism denotes the tendency of some people to use their way of life as a standard for judging and, usually, criticizing others. It indicates a belief by individuals that their race, culture, society, etc., are superior to others.

Folkways are types of norms. They are commonly accepted and informally sanctioned rules of behavior. Or, they may be thought of as being popular ways of thinking or acting, which are customary but not insisted upon. Formal punishments (negative sanctions) are not involved for those who deviate from expected behavior, but some form of informal punishment, such as expulsion, avoidance, or ostracism may be applied. Shaking hands as a way of greeting is an example of a folkway.

Frustration is individual or group inner conflict. It is created or increased by preventing or blocking the individual's or group's attainment of a desired goal. For example, the target individual's or group's unsuccessful attempts to visit their families may create frustration. Or, another example: The unrelenting presence of a combat force surrounding them may also create frustration.

Goals are the objectives that guide purposeful behavior to satisfy needs. For example, an individual or group may excel in combat as a goal to satisfy a perceived need for recognition and prestige, or to satisfy their standards of pride.

Group is two or more people recognized by others as a collectivity interacting to achieve common goals.

In-group or we-group is two or more people who have a mutual feeling of belonging together as a group. Each person identifies with the collectivity and is bound by mutual attitudes of cooperation, devotion, comradeship, loyalty, respect, sympathy, group pride, and a belief in their superiority over those outside the group. The attitudes of an in-group tend to motivate the individual or group to be hostile to, contemptuous of, indifferent to, and isolated from other groups. An in-group may also be a prestige group.

Interaction occurs when two or more individuals may come into contact and a change in the behavior and/or attitude of one, some, or all takes place. The psychological operator, using the technique of face-to-face communications, interacts with an individual or group. Through his persuasive message, a behavior and/or attitude change is sought.

Intercultural relations are the interactions between two or more individuals or groups differing in behaviors they have learned, shared, and transmitted by means of words, symbols, and actions.

Key communicator is an individual or group having the economic, social, or political power to persuade the individuals or groups with which he interacts to change or reinforce existing opinions, emotions, attitudes, and behaviors.

Language is the written or spoken word and symbols that denote or connote meanings to an individual or group. The denotational meaning of a word is all of the objects, events, or instances to which a word refers. The connotational meanings carry the emotional impact of language, rather than rational meaning or expression; i.e., feelings and attitudes rather than concrete physical items.

Mores are contemporary, required, and sanctioned rules (norms) of social behavior, similar to folkways, agreed upon by common consent for the welfare of society, whose violation justifies the use of sanctions. For example, in some societies mores exist that prohibit the eating of beef; in others, the eating of pork.

Motives, unlike the generalized predispositions of drives, are learned and goal directed. They are drives plus learning, allowing purposeful behavior to satisfy needs. Through learning, hunger is alleviated by a search for food. This is in contrast to a drive, a generalized disposition that may encompass a search, aggression, or hoarding.

Motivation is the process by which an individual or group initiates conscious, deliberate, and purposeful action. An individual or group may hear a loudspeaker message stating a comrade has defected and received food, clothing, shelter, and a pardon. Consciously and deliberately, an individual or group may lay down their weapons.

Needs may be described as tension-producing deficiencies within an individual or group, deficiencies which create a stimulus or tension. To reduce the tension, the individual or group initiates a need-satisfying behavior. If the need (tension) must be satisfied to sustain life, it is a primary or innate need (i.e., hunger or thirst), inborn, unlearned, and possessed by each individual or group. If the need is acquired by cultural and/or societal interaction, or related to social survival, it is a secondary or learned need.

Norm is the average or standard behavior, attitude, opinion, or perception shared by and expected of individuals and groups. Norms may be considered as rules in the game of life of each respective social group and related to its specific culture. Norms must also be seen as relative to the cultural setting in which they occur.

Opinion is a view, judgment, or appraisal formed in the mind about a particular matter or particular matters. It may also be said to be an intellectually defined judgment of what is true for the individual or group. It may be more influenced by attitudes than facts.

Out-group, other group, or they-group is comprised of all the individuals or groups that are not participants in the in-group/group under study. The group may be subjected to hostility, indifference, isolation, and contempt, behaviors that can be attributed to the in-group's attitudes. It should be noted, however, that not all individuals look at out-groups with hostility or hatred. Another common feeling is one of envy or a strong desire to become a member of the out-group. This is true when the members of the out-group have higher status and prestige, and the individual has the possibility of joining the out-group once he meets certain requirements. For example, businessmen wishing to increase their prestige desire to join increasingly higher status country or tennis clubs, or enlisted persons may desire to become officers.

Perceived needs are those tension-producing deficiencies which are sensed by vision, hearing, smell, taste, and/or touch and consciously evaluated; the aspect of perception is tinted by the individual's or group's culture and society. Tension, for example, could be suggested to the individual by his smelling the aroma of food cooking or by receiving a persuasive message...hunger.

Perception is the process of evaluating information which has been received and classified by the five physical senses (vision, hearing, smell, taste, and touch) and interpreted by criteria of the culture and society.

Politicomilitary activities encompass the complex of military activities which are conducted primarily for their direct, social, economic, political, and psychological impact. The activities, in their purest form, are the interaction of the military with the society-government. The operational concept involves such functions as community relations; civil affairs, to include civic action; psychological operations; certain aspects of informational activities; and coordination with other US Government agencies and friendly foreign governments.

Propaganda is any form of communication in support of national objectives designed to influence the opinions, emotions, attitudes, or behavior of any group in order to benefit the sponsor, either directly or indirectly.

Psychological objective is a statement of measurable response expected from the target audience as a result of PSYOP. The psychological objective must accurately define the specific behavioral response or attitude change desired which, in turn, must support the PSYOP goals.

Psychological operations include psychological warfare and encompass those political, military, economic, and ideological actions planned and conducted to create in neutral, friendly, and nonhostile foreign groups the emotions, attitudes, or behavior to support the achievement of national objectives.

Psychological warfare is the planned use of propaganda and other psychological actions to influence the opinions, emotions, attitudes, and behavior of hostile foreign groups in such a way as to support the achievement of national objectives.

Society is an enduring and cooperative social group whose members have developed organized patterns of relationships, traditions, institutions, and collective activities and interests. Societies may be considered to be relatively independent human groupings that have their own territory, contain persons of all ages and both sexes, and maintain their unique respective lifestyle (culture). The American people, for instance, have formed lasting and cooperative social groupings which demonstrate organized patterns of behavior such as religious, educational, and political systems.

Stimulus is an action agent or activity that inherently promotes or causes a response, stimulation always implying a response. For example, a persuasive message, airdropped into an industrial area, may warn of an impending air bombardment. The message may act as a stimulus, stimulating a mass evacuation of the area.

Strategic PSYOP are generally designed to further broad or long-term aims in coordination with general strategic planning, with gradual results realizable in the indefinite future. They are directed at enemy troops and civilians behind the combat zones or in enemy, friendly, or neutral countries. See "strategic psychological warfare," JCS Pub 1.

Susceptibility is the degree to which the target audience can be influenced to respond in ways that will assist in the accomplishment of the PSYOP portion of the commander's mission.

Symbols are objects or images whose values or meanings are given by those who use or recognize them; the values are not derived from physical properties. For example, the dove may be a symbol of peace.

Taboo is a prohibition whose violation is expected to produce an automatic penalty such as expulsion, confinement, or death at the hands of someone believed to have supernatural powers.

The complete message is the propaganda message (word) and action (deed) to persuade the individual or group to change or strengthen their opinions, emotions, attitudes, and behavior; the words and deeds are mutually supportive. The deed plus the word equals the message.

Value is the believed ability of someone or something to satisfy a psychological, physical, or social need of an individual or group. For example, an individual or group may defect to satisfy a human need for security, while another individual or group will remain with their fighting unit to satisfy their need for security and/or their pride in self and unit.

Vulnerability is a condition or sensitivity which creates a need within the target audience, rendering it responsive to persuasive appeals.

APPENDIX I

PSYOP TECHNIQUES

Knowledge of propaganda techniques is necessary to improve one's own propaganda and to uncover enemy PSYOP stratagems. Techniques, however, are not substitutes for the procedures in PSYOP planning, development, or dissemination.

Techniques may be categorized as:

Characteristics of the content self-evident. No additional information is required to recognize the characteristics of this type of propaganda. "Name calling" and the use of slogans are techniques of this nature.

Additional information required to be recognized. Additional information is required by the target or analyst for the use of this technique to be recognized. "Lying" is an example of this technique. The audience or analyst must have additional information in order to know whether a lie is being told.

Evident only after extended output. "Change of pace" is an example of this technique. Neither the audience nor the analyst can know that a change of pace has taken place until various amounts of propaganda have been brought into focus.

Repetition. This technique can be noted only after the same word, theme, message, or phrase has been used a number of times.

Nature of the arguments used. An argument is a reason, or a series of reasons, offered as to why the audience should behave, believe, or think in a certain manner. An argument is expressed or implied.

Inferred intent of the originator. This technique refers to the effect the propagandist wishes to achieve on the target audience. "Divisive" and "unifying" propaganda fall within this technique. It might also be classified on the basis of the effect it has on an audience.

SELF-EVIDENT TECHNIQUE

Appeal to Authority. Appeals to authority cite prominent figures to support a position, idea, argument, or course of action.

Assertion. Assertions are positive statements presented as fact. They imply that what is stated is self-evident and needs no further proof. Assertions may or may not be true.

Bandwagon and Inevitable Victory. Bandwagon-and-inevitable-victory appeals attempt to persuade the target audience to take a course of action "everyone else is taking." "Join the crowd." This technique reinforces people's natural desire to be on the winning side. This technique is used to convince the audience that a program is an expression of an irresistible mass movement and that it is in their interest to join. "Inevitable victory" invites those not already on the bandwagon to join those already on the road to certain victory. Those already, or partially, on the bandwagon are reassured that staying aboard is the best course of action.

Obtain Disapproval. This technique is used to get the audience to disapprove an action or idea by suggesting the idea is popular with groups hated, feared, or held in contempt by the target audience. Thus, if a group which supports a policy is led to believe that undesirable, subversive, or contemptible people also support it, the members of the group might decide to change their position.

Glittering Generalities. Glittering generalities are intensely emotionally appealing words so closely associated with highly valued concepts and beliefs that they carry conviction without supporting information or reason. They appeal to such emotions as love of country, home; desire for peace, freedom, glory, honor, etc. They ask for approval without examination of the reason. Though the words and phrases are vague and suggest different things to different people, their connotation is always favorable: "The concepts and programs of the propagandist are always good, desirable, virtuous."

Generalities may gain or lose effectiveness with changes in conditions. They must, therefore, be responsive to current conditions. Phrases which called up pleasant associations at one time may evoke unpleasant or unfavorable connotations at another, particularly if their frame of reference has been altered.

Vagueness. Generalities are deliberately vague so that the audience may supply its own interpretations. The intention is to move the audience by use of undefined phrases, without analyzing their validity or attempting to determine their reasonableness or application.

Rationalization. Individuals or groups may use favorable generalities to rationalize questionable acts or beliefs. Vague and pleasant phrases are often used to justify such actions or beliefs.

Simplification. Favorable generalities are used to provide simple answers to complex social, political, economic, or military problems.

Transfer. This is a technique of projecting positive or negative qualities (praise or blame) of a person, entity, object, or value (an individual, group, organization, nation, patriotism, etc.) to another in order to make the second more acceptable or to discredit it. This technique is generally used to transfer blame from one member of a conflict to another. It evokes an emotional response which stimulates the target to identify with recognized authorities.

Least of Evils. This is a technique of acknowledging that the course of action being taken is perhaps undesirable but that any alternative would result in an outcome far worse. This technique is generally used to explain the need for sacrifices or to justify the seemingly harsh actions that displease the target audience or restrict personal liberties. Projecting blame on the enemy for the unpleasant or restrictive conditions is usually coupled with this technique.

Name Calling or Substitutions of Names or Moral Labels. This technique attempts to arouse prejudices in an audience by labeling the object of the propaganda campaign as something the target audience fears, hates, loathes, or finds undesirable.

Types of name calling:

Direct name calling is used when the audience is sympathetic or neutral. It is a simple, straightforward attack on an opponent or opposing idea.

Indirect name calling is used when direct name calling would antagonize the audience. It is a label for the degree of attack between direct name calling and insinuation. Sarcasm and ridicule are employed with this technique.

Cartoons, illustrations, and photographs are used in name calling, often with deadly effect.

Dangers inherent in name calling: In its extreme form, name calling may indicate that the propagandist has lost his sense of proportion or is unable to conduct a positive campaign. Before using this technique, the propagandist must weigh the benefits against the possible harmful results. It is best to avoid use of this device. The obstacles are formidable, based primarily on the human tendency to close ranks against a stranger. For example, a group may despise, dislike, or even hate one of its leaders, even openly criticize him, but may (and probably will) resent any nongroup member who criticizes and makes disparaging remarks against that leader.

Pinpointing the Enemy: This is a form of simplification in which a complex situation is reduced to the point where the "enemy" is unequivocally identified. For example, the president of country X is forced to declare a state of emergency in order to protect the peaceful people of his country from the brutal, unprovoked aggression by the leaders of country Y.

Plain Folks or Common Man: The "plain folks" or "common man" approach attempts to convince the audience that the propagandist's positions reflect the common sense of the people. It is designed to win the confidence of the audience by communicating in the common manner and style of the audience. Propagandists use ordinary language and mannerisms (and clothes in face-to-face and audiovisual communications) in attempting to identify their point of view with that of the average person. With the plain folks device, the propagandist can win the confidence of persons who resent or distrust foreign sounding, intellectual speech, words, or mannerisms. The audience can be persuaded to identify its interests with those of the propagandist:

Presenting soldiers as plain folks. The propagandist wants to make the enemy feel he is fighting against soldiers who are "decent, everyday folks" much like himself; this helps to counter themes that paint the opponent as a "bloodthirsty" killer.

Presenting civilians as plain folks. The "plain folks" or "common man" device also can help to convince the enemy that the opposing nation is not composed of arrogant, immoral, deceitful, aggressive, warmongering people, but of people like himself, wishing to live at peace.

Humanizing leaders. This technique paints a more human portrait of US and friendly military and civilian leaders. It humanizes them so that the audience looks upon them as similar human beings or, preferably, as kind, wise, fatherly figures.

Categories of Plain Folk Devices:

Vernacular. This is the contemporary language of a specific region or people as it is commonly spoken or written and includes songs, idioms, and jokes. The current vernacular of the specific target audience must be used.

Dialect. Dialect is a variation in pronunciation, grammar, and vocabulary from the norm of a region or nation. When used by the propagandist, perfection is required. This technique is best left to those to whom the dialect is native, because native level speakers are generally the best users of dialects in propaganda appeals.

Errors. Scholastic pronunciation, enunciation, and delivery give the impression of being artificial. To give the impression of spontaneity, deliberately hesitate between phrases, stammer, or mispronounce words. When not overdone, the effect is one of deep sincerity. Errors in written material may be made only when they are commonly made by members of the reading audience. Generally, errors should be restricted to colloquialisms.

Homey words. Homey words are forms of "virtue words" used in the everyday life of the average man. These words are familiar ones, such as "home," "family," "children," "farm," "neighbors," or cultural equivalents. They evoke a favorable emotional response and help transfer the sympathies of the audience to the propagandist. Homey words are widely used to evoke nostalgia. **Care must be taken to assure that homey messages addressed to enemy troops do not also have the same effect on US/friendly forces.**

If the propaganda or the propagandist lacks naturalness, there may be an adverse backlash. The audience may resent what it considers attempts to mock it, its language, and its ways.

Social Disapproval: This is a technique by which the propagandist marshals group acceptance and suggests that attitudes or actions contrary to the one outlined will result in social rejection, disapproval, or outright ostracism. The latter, ostracism, is a control practice widely used within peer groups and traditional societies.

Virtue Words. These are words in the value system of the target audience which tend to produce a positive image when attached to a person or issue. Peace, happiness, security, wise leadership, freedom, etc., are virtue words.

Slogans: A slogan is a brief striking phrase that may include labeling and stereotyping. If ideas can be sloganized, they should be, as good slogans are self-perpetuating.

Testimonials: Testimonials are quotations, in or out of context, especially cited to support or reject a given policy, action, program, or personality. The reputation or the role (expert, respected public figure, etc.) of the individual giving the statement is exploited. The testimonial places the official sanction of a respected person or authority on a propaganda message. This is done in an effort to cause the target audience to identify itself with the authority or to accept the authority's opinions and beliefs as its own. Several types of testimonials are:

Official Sanction. The testimonial authority must have given the indorsement or be clearly on record as having approved the attributed idea, concept, action, or belief. Four factors are involved:

Accomplishment. People have confidence in an authority who has demonstrated outstanding ability and proficiency in his field. This accomplishment should be related to the subject of the testimonial.

Identification with the target. People have greater confidence in an authority with whom they have a common bond. For example, the soldier more readily trusts an officer with whom he has undergone similar arduous experiences than a civilian authority on military subjects.

Position of authority. The official position of authority may instill confidence in the testimony; i.e., head of state, division commander, etc.

Inanimate objects. Inanimate objects may be used in the testimonial device. In such cases, the propagandist seeks to transfer physical attributes of an inanimate object to the message. The Rock of Gibraltar, for example, is a type of inanimate object associated with steadfast strength.

Personal Sources of Testimonial Authority.

Enemy leaders. The enemy target audience will generally place great value on its high level military leaders as a source of information.

Fellow soldiers. Because of their common experiences, soldiers form a bond of comradeship. As a result, those in the armed forces are inclined to pay close attention to what other soldiers have to say.

Opposing leaders. Testimonials of leaders of the opposing nation are of particular value in messages that outline war aims and objectives for administering the enemy nation after it capitulates.

Famous scholars, writers, and other personalities. Frequently, statements of civilians known to the target as authoritative or famous scholars, writers, scientists, commentators, etc., can be effectively used in propaganda messages.

Nonpersonal Sources of Testimonial Authority.

Institutions, ideologies, national flags, religious, and other nonpersonal sources are often used. The creeds, beliefs, principles, or dogmas of respected authorities or other public figures may make effective propaganda testimonials.

Factors To Be Considered.

Plausibility. The testimonial must be plausible to the target audience. The esteem in which an authority is held by the target audience **will not always** transfer an implausible testimonial into effective propaganda.

False testimonials. Never use false testimonials. Highly selective testimonials? Yes. Lies (fabrications)? Never. Fabricated (false) testimonials are extremely vulnerable because their lack of authenticity makes them easy to challenge and discredit.

PROPAGANDA TECHNIQUES WHICH ARE BASED ON CHARACTERISTICS OF THE CONTENT BUT WHICH REQUIRE ADDITIONAL INFORMATION ON THE PART OF AN ANALYST TO BE RECOGNIZED

Incredible truths. There are times when the unbelievable (incredible) truth not only can but should be used. Among these occasions are:

When the psychological operator is certain that a vitally important event will take place.

A catastrophic event, or one of significant tactical or strategic importance, unfavorable to the enemy has occurred and the news has been hidden from the enemy public or troops.

The enemy government has denied or glossed over an event detrimental to its cause.

A double-cutting edge. This technique has a double-cutting edge: It increases the credibility of the US/friendly psychological operator while decreasing the credibility of the enemy to the enemy's target audience. Advanced security clearance must be obtained before using this technique so that operations or projects will not be jeopardized or compromised. Actually, propagandists using this technique will normally require access to special compartmented information and facilities to avoid compromise of other sensitive operations or projects of agencies of the US Government.

Though such news will be incredible to the enemy public, it should be given full play by the psychological operator. This event and its significance will eventually become known to the enemy public in spite of government efforts to hide it. The public will recall (the psychological operator will "help" the recall process) that the incredible news was received from US/ allied sources. They will also recall the deception of their government. The prime requirement in using this technique is that the disseminated incredible truth must be or be certain to become a reality.

Insinuation. Insinuation is used to create or stir up the suspicions of the target audience against ideas, groups, or individuals in order to divide an enemy. The propagandist **hints**, **suggests**, and **implies**, allowing the audience to draw its own conclusions. Latent suspicions and cleavages within the enemy camp are exploited in an attempt to structure them into active expressions of disunity which weaken the enemy's war effort.

Exploitable vulnerabilities. Potential cleavages which may be exploited include the following:

Political differences between the enemy nation and its allies or satellites.

Ethnic and regional differences.

Religious, political, economic, or social differences.

History of civilian animosity or unfair treatment toward enemy soldiers.

Comforts available to rear area soldiers and not available to combat soldiers.

People versus the bureaucracy or hierarchy.

Political differences between the ruling elite, between coalitions members, or between rulers and those out of power.

Differences showing a few benefiting at the expense of the general populace.

Unequal or inequitable tax burdens, or the high level of taxes. The audience should be informed of hidden taxes.

The scarcity of consumer goods for the general public and their availability to the various elites and the dishonest.

Costs of present government policies in terms of lost opportunities to accomplish constructive socially desirable goals.

The powerlessness of the individual. (This may be used to split the audience from the policies of its government by disassociating its members from those policies.) This technique could be used in preparing a campaign to gain opposition to those government policies.

Insinuation devices. A number of devices are available to exploit these and similar vulnerabilities:

Leading questions: The propagandist may ask questions which suggest only one possible answer. Thus, the question, "What is there to do now that your unit is surrounded and you are completely cut off?" insinuates that surrender or desertion is the only reasonable alternative to annihilation.

Humor: Humor can be an effective form of insinuation. Jokes and cartoons about the enemy find a ready audience among those persons in the target country or military camp who normally reject straightforward accusations or assertions. Jokes about totalitarian leaders and their subordinates often spread with ease and rapidity. However, the psychological operator must realize that appreciation of humor differs among target groups and so keep humor within the appropriate cultural context.

Pure motives. This technique makes it clear that the side represented by the propagandist is acting in the best interests of the target audience, insinuating that the enemy is acting to the contrary. For example, the propagandist can use the theme that a satellite force fighting on the side of the enemy is insuring the continued subjugation of its country by helping the common enemy.

Guilt by association: Guilt by association links a person, group, or idea to other persons, groups, or ideas repugnant to the target audience. The insinuation is that the connection is not mutual, accidental, or superficial.

Rumor: Malicious rumors are also a potentially effective form of insinuation.

Pictorial and photographic propaganda: A photograph, picture, or cartoon can often insinuate a derogatory charge more effectively than words. The combination of words and photograph, picture, or cartoon can be far more effective. In this content, selected and composite photographs can be extremely effective.

Vocal: Radio propagandists can artfully suggest a derogatory notion, not only with the words they use, but also by the way in which they deliver them. Significant pauses, tonal inflections, sarcastic pronunciation, ridiculing enunciation, can be more subtle than written insinuation.

Card stacking or selective omission: This is the process of choosing from a variety of facts only those which support the propagandist's purpose. In using this technique, facts are selected and presented which most effectively strengthen and authenticate the point of view of the propagandist. It includes the collection of all available material pertaining to a subject and the selection of that material which most effectively supports the propaganda line. Card stacking, case making, and censorship are all forms of selection. Success or failure depends on how successful the propagandist is in selecting facts or "cards" and presenting or "stacking" them.

Increase prestige: In time of armed conflict, leading personalities, economic and social systems, and other institutions making up a nation are constantly subjected to propaganda attacks. Card stacking is used to counter these attacks by publicizing and reiterating the best qualities of the institutions, concepts, or persons being attacked. Like most propaganda techniques, card stacking is used to supplement other methods.

The technique may also be used to describe a subject as virtuous or evil and to give simple answers to a complicated subject.

An intelligent propagandist makes his case by imaginative selection of facts. The work of the card stacker in using selected facts is divided into two main phases:

First, the propagandist selects only favorable facts and presents them to the target in such a manner as to obtain a desired reaction.

Second, the propagandist uses these facts as a basis for conclusions, trying to lead the audience into accepting the conclusions by accepting the facts presented.

Presenting the other side: Some persons in a target audience believe that neither belligerent is entirely virtuous. To them propaganda solely in terms of right and wrong may not be credible. Agreement with minor aspects of the enemy's point of view may overcome this cynicism. Another use of presenting the other side is to reduce the impact of propaganda that opposing propagandists are likely to be card stacking (selective omission).

Lying and distortion: Lying is stating as truth that which is contrary to fact. For example, assertions may be lies. **This technique will not be used by US personnel.** It is presented for use of the analyst of enemy propaganda.

Simplification: This is a technique in which the many facts of a situation are reduced so the right or wrong, good or evil, of an act or decision is obvious to all. This technique (simplification) provides simple solutions for complex problems. By suggesting apparently

simple solutions for complex problems, this technique offers simplified interpretations of events, ideas, concepts, or personalities. Statements are positive and firm; qualifying words are never used.

Simplification may be used to sway uneducated and educated audiences. This is true because many persons are well educated or highly skilled, trained specialists in a specific field, but the limitations of time and energy often force them to turn to and accept simplifications to understand, relate, and react to other areas of interest.

Simplification has the following characteristics:

It thinks for others: Some people accept information which they cannot verify personally as long as the source is acceptable to them or the authority is considered expert. Others absorb whatever they read, see, or hear with little or no discrimination. Some people are too lazy or unconcerned to think problems through. Others are uneducated and willingly accept convenient simplifications.

It is concise: Simplification gives the impression of going to the heart of the matter in a few words. The average member of the target audience will not even consider that there may be another answer to the problem.

It builds ego: Some people are reluctant to believe that any field of endeavor, except their own, is difficult to understand. For example, a layman is pleased to hear that "law is just common sense dressed up in fancy language," or "modern art is really a hodgepodge of aimless experiment or nonsense." Such statements reinforce the ego of the lay audience. It is what they would like to believe, because they are afraid that law and modern art may actually be beyond their understanding. Simple explanations are given for complex subjects and problems.

Stereotyping is a form of simplification used to fit persons, groups, nations, or events into readymade categories that tend to produce a desired image of good or bad. Stereotyping puts the subject (people, nations, etc.) or event into a simplistic pattern without any distinguishing individual characteristics.

CHARACTERISTICS OF CONTENT WHICH MAY BECOME EVIDENT WHEN NUMEROUS PIECES OF OUTPUT ARE EXAMINED

Change of Pace: Change of pace is a technique of switching from belligerent to peaceful output, from "hot" to "cold," from persuasion to threat, from gloomy prophecy to optimism, from emotion to fact.

Stalling: Stalling is a technique of deliberately withholding information until its timeliness is past, thereby reducing the possibility of undesired impact.

Shift of Scene: With this technique, the propagandist replaces one "field of battle" with another. It is an attempt to take the spotlight off an unfavorable situation or condition by shifting it to another, preferably of the opponent, so as to force the enemy to go on the defense.

REPETITION

An idea or position is repeated in an attempt to elicit an almost automatic response from the audience or to reinforce an audience's opinion or attitude. This technique is extremely valid and useful because the human being is basically a creature of habit and develops skills and values by repetition (like walking, talking, code of ethics, etc.). An idea or position may be repeated many times in one message or in many messages. The intent is the same in both instances, namely, to elicit an immediate response or to reinforce an opinion or attitude.

PROPAGANDA TECHNIQUES BASED ON THE NATURE OF THE ARGUMENTS USED

The two major types of arguments used in propaganda are rational and nonrational. When this category is used, it must be understood that the truth or falsity of the content has nothing to do with the nature of the argument. Thus, an elaborate structure of reasons proposed to a target audience might consist entirely of lies but still qualify as a rational appeal.

The outstanding example of a rational argument is one using the least-of-evils technique. Selection, case making, and card stacking also fall within the category of rational arguments, as might appeals to authority and, possibly, testimonials.

Nonrational arguments sometimes contain numerous virtue words or engage in considerable name calling. But the mere presence of these characteristics is insufficient reason to label an argument nonrational.

PROPAGANDA CLASSIFIED ON THE BASIS OF THE INFERRED INTENTS OF THE ORIGINATOR

Anticipatory or Preparatory: This type of propaganda is disseminated in order to bring the expectancies of the target audience in line with the realities of the situation. This technique which prepares the audience for the "worst" is used to soften the blow of an unfavorable situation or result.

Divisive Propaganda: Divisive propaganda intentionally raises issues to stir up dissent and factions within the target audience.

Hot Potato: Hot potato is a technique in which the propagandist presents a potentially embarrassing event, situation, or issue in order to force the enemy to respond, knowing that the response will put the opponent in a bad light.

Coercive Propaganda: This type of propaganda uses forceful or threatening language in order to intimidate the target audience into supporting a position. It is of limited value and duration.

Fear themes and messages: Fear themes and messages are among the most effective means of influencing target audiences. Fear which binds group members against the outside, such as fear that the enemy (the outsider) will block, erode, or destroy the basic values of the audience, has long been used by individuals and groups having parochial interests. In the realm of politics this is illustrated when factions within a political entity are bitterly split over an important issue and someone from outside the entity enters the conflict with his solution to the divisive problem. The differing parties will immediately unite (close ranks) against the outsider.

Using fear messages: When using fear messages, give specific, simple instructions in offering a solution that minimizes the possibility of danger. The message must state or infer that the action called for can be performed if the target follows precisely the simple and precise instructions given in the message. In giving instructions, the psychological operator wants to affect behavior, not test intelligence.

Effectiveness of fear messages: Fear messages are most effective when:

They arouse fear for the safety and welfare of the individual and close family members.

The source of the message is prestigious and credible to the target audience.

The audience is not familiar with the details of the threat posed. Ignorance of the details can be used to pose a threat and build fear.

Members of the audience are self-centered.

The target can take immediate action to execute simple, specific instructions.

Fear of change. People fear change, particularly sudden, imposed change over which they have no control. They fear it will take from them status, wealth, family, friends, comfort, safety, life, or limb. That's why the man in the foxhole hesitates to leave it. He knows and is accustomed to the safety it affords. He is afraid that moving out of his foxhole will expose him to new and greater danger. That is why the psychological campaign must give him a safe, honorable way out of his predicament or situation.

Terrorism: The United States is absolutely opposed to the use of terror or terror tactics. But the psychological operator can give a boomerang effect to enemy terror, making it reverberate against the practitioner, making him repugnant to his own people, and all others who see the results of his heinous savagery. This can be done by disseminating fully captioned photographs in the populated areas of the terrorist's homeland. Such leaflets will separate civilians from their armed forces; it will give them second thoughts about the decency and honorableness of their cause, make them wonder about the righteousness of their ideology, and make the terrorists repugnant to them. Followup leaflets can "fire the flames" of repugnancy, indignation, and doubt, as most civilizations find terror repugnant.

In third countries: Fully captioned photographs depicting terroristic acts may be widely distributed in third countries (including the nation sponsoring the enemy) where they will instill a deep revulsion in the general populace. Distribution in neutral countries is particularly desirable in order to swing the weight of unbiased humanitarian opinion against the enemy.

The enemy may try to rationalize and excuse its conduct (terroristic), but in so doing, it will compound the adverse effect of its actions, because it can never deny the validity of true photographic representations of its acts. Thus, world opinion will sway to the side of the victimized people.

Friendly territory: Under no circumstances should such leaflets be distributed in friendly territory. To distribute them in the friendly area in which the terrorists' acts took place would only create feelings of insecurity. This would defeat the purpose of the psychological operator, which is to build confidence in the government or agency he represents.

APPENDIX J

GRAPHICS, MUSIC, AND SOUND EFFECTS REGISTER GUIDES

Lists and files of art, music, and sound effects native to the anticipated area or country of operations should be prepared by PSYOP units. The material should be continuously reevaluated and upgraded.

The lists in this appendix are guides to material to support propaganda production or in-country PSYOP campaigns.

GRAPHICS REGISTER GUIDE

Scenery and Scenes:

Scenery

Street scenes, cities, towns, villages, hamlets

Idyllic scenes

People:

Key personalities

Members of target audience ethnic groups

Crowds

Children in ordinary and extraordinary, charming, amusing, sad, or tragic poses or activities

Target audience ethnic groups engaged in their various occupations

Military groups with accurate depiction of uniforms, arms, and equipment

Families at home, work, play

Depictions of all possible emotions by individuals

Clothing of all groups and ages, both sexes (including common denominator infantry clothing)

The Home:

Interiors, exteriors, all types of domiciles, private and public buildings, installations, and factories

Furniture and furnishings

Food, food preparation, eating habits, sources of food

Noneconomic Events and Activities:

- Activities involving US, friendly and enemy military personnel, and target civilian population groups
- Social activities of all groups and ages
- Religious activities
- Amusements
- Sports
- Unusual events and incidents

Economic Activities:

- Industrial
- Commercial
- Financial
- Agricultural
- Waterborne
- Other normal occupations
- Unusual occupations of all groups
- Means of transportation, from human bearers to aircraft

Equipment-Occupational and Household:

- Tools, farm implements
- Weapons
- Utensils, cutlery

Art Forms:

- Music
- Dance
- Painting, drawing, sculpture
- Representations of femininity
- Representations of masculinity
- Pornography--of areas in which acceptable

Military:

- Records (photographic, if possible) of all rehabilitation, MAP, AID, and other similar support, US and foreign
- Records (photographic, if possible) of typical pre-MAP or AID conditions, especially of well-known buildings and installations
- Records (photographs, if possible) of war damages

Records (photographs, if possible) of friendly PSYOP and audience reactions

Long-range photography (close-up, if possible) of enemy frontline positions and fortifications

Photographs of the activities, comforts, and conditions of prisoners of war and civilian internees. Must not be in violation of Rules of Land Warfare and pertinent conventions.

MUSIC REGISTER GUIDE

A music file should be established. The following outline can be used as a guide for such a file:

Folk tunes: dances, ballads

Classics: operas, traditional music

Popular music: currently popular, perennially popular, jazz

Patriotic music: national anthems, military, special holiday, ceremonial, and historical music

Religious music

Denied music: Each music composition, song, or ditty which has been denied to target audiences should be collected, stored, and prepared for use as occasions warrant

Songs of vendors: Record and collect these as feasible

SOUND EFFECTS REGISTER GUIDE

Musical openings, closing bridges, and other sound effects are of vital importance to the dramatic emphasis which may be integrated into sound programs (radio, loudspeaker, television). Ideally, they should be produced by local musicians from areas of operational interest during nonconflict periods. Suggested types of sound effects which should be stored are-

Musical Effects:

Majestic fanfares to usher in processions of dignitaries

Music connotating massive bustling activity of major proportions and importance

Musical announcements of a gathering of martial forces

Fanfares for important announcements

Heavy dramatic openings, serious (some in minor key)

Light dramatic openings, some comic and gay

Medium dramatic openings, not comic nor heavy

Dramatic martial openings, especially for documentaries

Musical connotations of massive destruction, as of a destroyed city, scorched earth, a deserted village, or a wasteland

Musical suggestions of desperation, strong emotions, or agitation

Comical musical representations

Connotations of a mysterious atmosphere with overtones of menace

Meditations

Suggestions of a whimsical tale to follow; light, frothy

Musical descriptions of a street scene, business activities, many people, shopping, bargaining, traffic tieups

Swirling fogs, musically described

Treachery, musically invoked

Musical descriptions of the emotional reactions to a moral blow

Musical reaction to the worst possible news

Musical connotations of the awakening of anger followed by that which evokes mysterious menace, purposeful revenge

Dangerous action

Tone pictures of early morning, of songbirds, or the morning dew--of an awakening, a beginning

Peasant dances, gatherings

Musical equivalent of a comic or amusing interlude, clowns dancing

Music for nature at work, activities of nature, birds, animals

Man at work, building, creating

Warm feeling of an emotional uplift

Musical description of hope awakening, help coming

Music for the approach of the unknown--its steady approach, closer and closer

A poignant stab

An emotional shock, changing to a mood of mystery

Sharp stabs--strings

Stab and holds, repeated to build up tension (varying lengths)

Light dramatic curtains

Medium dramatic curtains

Heavy dramatic curtains

Documentary curtains

Fear music, reactions to approaching disasters

Martial music, national pride musically expressed

Sadness, music connotating the loss of something dear

Musical contemplation, connotating relaxed moods

Music expressing excitement, hurry, confusion, bustle

Other Sound Effects:

Sounds of military action

Street noises

Airport sounds

Animal sounds

Sounds of the market place

Farm sounds

Train and boat whistles

Sounds of various types of vehicles

Sounds of school, bells, children at play, in class

Sounds of church, mosque, temple, etc; praying, bells, gongs, drums, songs, dances, etc.

Sounds of local people at work, play, at home

Transportation sounds, harbor sounds, truck, rail, and other transport sounds

Additional Sound Effects: Additional sound effects are frequently necessary for the production of radio and television programs. Some are also pertinent to loudspeaker broadcasts.

31 AUGUST 1979

By Order of the Secretary of the Army:

E. C. MEYER
General, United States Army
Chief of Staff

Official:

J. C. PENNINGTON
Major General, United States Army
The Adjutant General

DISTRIBUTION:

Active Army, ARNG, and USAR: To be distributed in accordance with DA Form 12-11B, Requirements for Psychological Operations, US Army Doctrine (Qty rqr block no. 326) and Psychological Operations, Techniques and Procedures (Qty rqr block no. 327).

Additional copies can be requisitioned from the US Army Adjutant General Publications Center, 2800 Eastern Boulevard, Baltimore, MD 21220.

to facilitate their return to base. Another

leaflet in the same series is shown

in illustration number 8 on page 36.

Note

Instructional and informational material concerning psychological warfare has been requested in a considerable number of inquiries addressed to Propaganda Branch, Intelligence Division. This SYLLABUS OF PSYCHOLOGICAL WARFARE has been prepared to meet such inquiries until more basic documentation is available. Psychological warfare, sometimes called military propaganda, is a subject new to formal American military doctrine; its definition in relation to other military topics will accordingly take special time and care. A field manual, a technical manual, ordnance and air studies and other appropriate documents are in course of preparation, but until they are approved for publication, no book or outline can be represented as expressing the official views and policies of the War Department. This SYLLABUS is designed to serve during the interim and it must be understood to be provisional in character. It will be superseded when the more formal publications become available.

This SYLLABUS is designed either for independent reading or for course instruction. It has been prepared by Major Paul M. A. Linebarger, AUS, who is in civilian life a professor at the School of Advanced International Studies, Washington, D. C. Major Linebarger is also preparing a college-level textbook on psychological warfare. He has worked in this field at the old Psychological Warfare Branch, the O.W.I., the CBI and China Theater propaganda facilities and this Branch.

The Psychological Warfare Division, G-2, Army Ground Forces has closely cooperated in the preparation of this SYLLABUS for publication. Propaganda Branch issues and endorses this SYLLABUS only to the extent of making it available as an instructional aid.

I. Definitions

¶1. PSYCHOLOGICAL WARFARE. Psychological warfare has been defined as warfare psychologically waged; that is, military operations carried out with close and studied reference to the politics, opinion, and morale of the enemy. It is not in this sense that the term has been used in American practice during World War II. Psychological warfare has been, more narrowly, defined as comprising the use of propaganda against an enemy, together with such other operational measures of a military nature as the effective use of propaganda may require.

¶2. PROPAGANDA. Propaganda may be loosely described as "organized non-violent persuasion." More technically, it may be defined for Army purposes as follows: Military propaganda consists of the planned use of any form of communication designed to affect the minds and emotions of a given enemy, neutral, or friendly foreign group for a specific strategic or tactical purpose.

¶3. OVERT PROPAGANDA. Overt or "white" propaganda is propaganda which is officially or otherwise plainly issued from a known source. (See Illustrations #1, #4, or #5, as opposed to #9, which falsely implies that it is of American origin.)

¶4. COVERT PROPAGANDA. Covert or "black" propaganda is issued from a concealed or falsified source. (Illustration #9; or a radio station which pretends to be a "freedom station" and is actually operated by one of the belligerent powers.)

¶5. STRATEGIC PROPAGANDA. Strategic propaganda is directed at enemy forces, enemy peoples or enemy-occupied areas in their entirety and--in coordination with other strategically planned means--is designed to effectuate results sought over a long period of time.

¶6. TACTICAL PROPAGANDA. Tactical propaganda (sometimes called "combat propaganda") is directed at specific audiences, and is prepared and executed in support of combat operations.

¶7. CONSOLIDATION PROPAGANDA. Consolidation propaganda is directed toward civil populations in areas occupied by a military force and is designed to insure compliance with the commands promulgated by the commander of the occupying force.

¶8. COUNTERPROPAGANDA. Counterpropaganda is designed to refute a specific point or theme of enemy propaganda.

¶9. POLITICAL WARFARE. Political warfare (also called "crisis diplomacy," or "the war of nerves," or the "diplomacy of dramatic intimidation") consists of the framing of national policy in such a way as to facilitate propaganda or military operations, whether with respect to the direct political relations of governments to one another or in relation to groups of persons possessing a political character.

¶10. MEDIA. The devices by means of which the communication is conveyed. (In everyday life, the most common media are the living voice, the telephone, print, and the typewriter. In war propaganda, the most common media are voice radio, wireless in plain code, leaflets and pamphlets.)

Allied psychological warfare was based preeminently on the political warfare developed by President Woodrow Wilson. The United States entered the war in 1917 with a clear conscience, since the Kaiser's government was plainly the aggressor. Immediately upon participation, the U. S. government strove for the Fourteen Points. These assured both Allies and enemies that the United States sought no new territory as a result of war, that we stood for open diplomacy, that we believed in a "league to enforce peace," which would make further war impossible. They also promised democratic self-government to the hitherto-suppressed nationalities of the Baltic and Central Europe (Poland, Czechoslovakia, Latvia, etc.). This democratic political offensive was propagandized by official government action, but its greatest effect was achieved when it was carried by ordinary news channels all over the world.

British political warfare supplemented American effectively. In special cases, the British accomplished even more striking results. Against Turkey they rallied the Arab states, while rallying world-wide Jewish Zionist help to their side by promising the Jews a national home in Palestine (Balfour Declaration). India was quieted, in the face of German, Turkish, and revolutionary propaganda, by the Montagu statement and Montagu-Chelmsford reforms. Japanese political warfare during World War I was directed at her co-ally, China.

II. Psychological Warfare, 1914-1918

¶11. PSYCHOLOGICAL WARFARE IN THE FIRST WORLD WAR. In the first World War, psychological warfare was employed chiefly by means of political warfare and through combat propaganda which used air-borne and artillery-fired leaflets. Radio was not available.

¶12. POLITICAL WARFARE OF THE CENTRAL POWERS AND THE ALLIES. The Central Powers used very old-fashioned political warfare. They were reactionary monarchies, legitimist in outlook, and were unable to exploit the revolutionary, democratic or autonomist sentiments of the time. Their chief political warfare exploits consisted of inducing Turkey to proclaim a jihad against the Allies; since the Turkish sultan was the titular caliph of all Islam, this seemed promising but was countered by local measures (T. E. Lawrence and the Arab revolt against Turkey, for example) in the Middle East, and of the assistance offered to Lenin and the Bolshevik leaders by the German General Staff. The Germans gave Lenin, a subject of the Czar, transit from Switzerland to Finland in the expectation that Lenin would enter Russia, commit high treason against the Czar, and take Russia out of the war. He did so, but the ensuing wave of Communist revolution contributed to the defeat of Germany as well.

Allied psychological warfare was based preeminently on the political warfare developed by President Woodrow Wilson. The United States entered the war in 1917 with a clear conscience, since the Kaiser's government was plainly the aggressor. Immediately upon participation, the U. S. government strove for the Fourteen Points. These assured both Allies and enemies that the United States sought no new territory as a result of war, that we stood for open diplomacy, that we believed in a "league to enforce peace" which would make further war impossible. They also promised democratic self-government to the hitherto-suppressed nationalities of the Baltic and Central Europe (Poland, Czechoslovakia, Latvia, etc.). This democratic political offensive was propagandized by official government action, but its greatest effect was achieved when it was carried by ordinary news channels all over the world.

British political warfare supplemented American effectively. In special cases, the British accomplished even more striking results. Against Turkey they rallied the Arab states, while rallying world-wide Jewish Zionist help to their side by promising the Jews a national home in Palestine (Balfour Declaration). India was quieted, in the face of German, Turkish, and revolutionary propaganda, by the Montagu statement and Montagu-Chelmsford reforms. Japanese political warfare during World War I was directed at her co-Ally, China.

At the end of the war, the Allies faced a serious problem in the revolutionary propaganda of the Russian Communists, who had established a Soviet communist form of state which denied the legitimacy of all other states. The Soviet leaders expected revolution to break out throughout the world. Communist revolts did occur in Hungary, Bavaria, Berlin and elsewhere. The Allies countered these with military intervention on the side of the Conservatives in Russia and with diplomatic and military aid to the states around Russia ("cordon sanitaire"). The reciprocal bitterness and suspicion which resulted from this clash between Allies and Bolsheviki later provided a line of cleavage which Hitler utilized in preparing World War II.

¶14. THE CREEL COMMITTEE. The national propaganda agency of the United States government--the Committee on Public Information, usually known by the name of its chairman, George Creel--was the "Creel Committee." This was actually an emergency wartime department of the government. It was set up by order of the President and was financed out of his special war funds, later supplemented by congressional appropriations. The Creel Committee organized both domestic and foreign propaganda. (There was no War Department or General Staff agency charged with the military side of psychological warfare.) Coordination was effected by Mr. Creel himself; he had close access to the President and to the appropriate cabinet members.

¶15. DOMESTIC PROPAGANDA. Internal propaganda within the United States was more difficult than it was to be in World War II. The decision to declare war had to be taken by the United States. The Germans had been too clever to unite us, as did the Japanese with their psychological blunder at Pearl Harbor, by means of an overt attack on American territory. The Creel Committee had the normal problems of wartime morale (slackers, profiteers, inert people); it also had well-organized groups of Irish-Americans (Ireland then being anti-British), German-Americans and powerful isolationists to counter. The Committee proceeded vigorously on the domestic front. Since there was no radio, it organized "Four Minute Men," standardized public speakers who carried war messages throughout the country. It served the press by systematizing government information policy. It used posters, advertising, cartoons, civic clubs, the theatre, movies, and women's organizations as outlets for its material. The political warfare--the extent of the promises made for a democratic, war-free, prosperous post-war world--probably contributed to the post-1918 reaction against "propaganda" which continued down to World War II; in retrospect, it appears excessive and certain to have caused post-war disappointment and embarrassment to the government.

¶16. TACTICAL PROPAGANDA. Leaflets were the chief means of battle-front propaganda on the Western front. The Germans threatened to

take measures against British airplane pilots who dropped leaflets, so that the British and Americans relied chiefly on mortars and balloons. In General Pershing's headquarters, a section G-2 D was organized for "psychologic" warfare, and tactical leaflets were showered on the German lines. These included surrender passes; forms on which Germans could notify their families that they were safe, pictures of well-fed prisoners of war in American hands; political attacks on Kaiserism and on Prussian control of non-Prussian Germany; leaflets giving the German troops the correct news of the war, when bad; and emphasis on the democratic aims of the Allies. German profiteers and capitalists were attacked. Chief emphasis was on food, however, since the Germans were starving, and on the fact that the Americans had arrived in Europe in large numbers and that millions more were coming. Post-1918 German commentators (including Ludendorff and Hitler) blamed Germany's defeat on Allied propaganda, and credited the Allies with effective professional propaganda. Part of the German willingness to admire Allied propaganda must be discounted, since the German admiration was based in part on an unwillingness to admit loss of the war by military means. Nevertheless, propaganda was a major ingredient of Allied victory in World War I.

¶17. THE INTER-WAR PERIOD. The Communists used propaganda as a major weapon for achieving and consolidating their rule in Russia, and used propaganda for the attempted subversion of "capitalist states". This tended to identify propaganda as something which "Bolsheviks" could use, but which established governments could not counter-employ. In tactical psychological warfare, propaganda was the main feature of Chiang Kai-shek's preliminary unification of China; he had studied Russian irregular warfare and psychological warfare in Moscow.

Illustration #1. American Combat Leaflet, World War I.

III. Experience of World War II

¶18. THE NAZIS AS PROPAGANDISTS. In order to gain control of Germany, the National Socialist German Workers' Party, as Hitler called himself and his followers, had to use psychological warfare methods in time of peace. This was made possible by the breach of faith between Left and Right in Germany, each of which had become acutely conscious of propaganda. (The Left, KPD, or German Communist Party, was so propaganda-sensitive that all considerations of constitutionalism or internal security had to be reviewed on the assumption that other parties were propaganda-conscious and that every political move was filled with propaganda value. This stultified their own effectiveness. The anti-Nazis never united successfully.) The Nazis cynically tried to learn from Communist experience and soon gained a mastery of mass media. They used posters, rumor campaigns, personal intimidation, mass rallies, radio, and a coordinated press. They learned strategic psychological warfare techniques--simplicity, clarity, repetition, splitting the opponents, alternate appeasement and intimidation of antagonists--on their way to power within Germany. Once in power, they subordinated their politics to propaganda.

¶19. EFFECTS OF OVER-EMPHASIZED PROPAGANDA. The Nazis over-did propaganda to the extent that neither the Nazi party members nor, even less, the German people could tell what they really wanted. They could not even find out what Germany as a whole was doing or planning to do. The government controlled all news, entertainment, radio, telegraphs; the mails were not secret; publishing was under license. Opposition had to be violent and illegal ("purges"). Secret police and internal espionage used terror against the home population. This gave the Germans a united country. They did not have to worry about cheap, insincere, or fatuous opposition. They did not have to put up with foreign or private propaganda. But they paid a terrible price for this false security, since they lost all chance of finding out their own true economic, political or legal position. By being too suspicious of outside propaganda, they made themselves the utter, willing dupes of Hitlerite propaganda. Propaganda not only put Hitler into power; it helped to keep him there after all other parties were "unified" into the Nazi party or else suppressed, and after criticism and opposition gave the Germans no further chance to check up on him or to oppose him, except through high treason. The evils of the private press were ended; the evils of a single-party system and a controlled press were greater.

¶20. THE CONQUEST OF AUSTRIA AND CZECHOSLOVAKIA. After achieving power within Germany, Hitler began applying the same tactics in his foreign affairs. He called the bluff of the Allies by re-

militarizing the Rhineland, by making it seem a mere matter of prestige. He bullied Austria into submission; Nazi troops crossed the frontier without opposition and reduced the whole country without having to fight. This was accomplished by careful analysis of public opinion in the possible enemy states and by the use of propaganda to scare the victim while assuring all other prospective victims that the occasion in question was the last aggression. Hitler used psychological warfare in the broad sense as well as strategic and tactical propaganda. In 1938, with the Munich crisis, he scored his greatest victory in psychological warfare. The Western democracies (France, England) agreed to the partition of Czechoslovakia in a conference with the Axis (Italy, Germany) while the Russians were excluded from the bargaining. Hitler's propaganda emphasized German claims to the Czech territory in question, and promised no more aggression. Using the threat of force and the manipulation of anti-World War opinion in the democracies themselves, Hitler's propaganda won. A few months later he took the rest of Czechoslovakia and followed that by bullying Russia into a neutrality agreement. The scene was ready for further aggression. Psychological warfare had made the victims themselves agree to each single aggression, had made them hope it was the last, and had kept them from forming an alliance to meet the common danger.

¶21. MILITARY THREAT BEHIND THE PROPAGANDA OPERATION.

These successes could not have been won if suspicions between Communists and democratic countries had not been high, if anti-war sentiment had not been so strong, if Hitler had been more frank about his ultimate aims. Furthermore, they could not have been won if psychological warfare had not been backed up by a very real threat of armed force. Hitler did not begin his major aggressions until he had a military edge on his opponents, and his propaganda made his strength seem greater than it was. Whenever he was not operating he let his army and Luftwaffe seem weak, and encouraged the idea he was unready; but crises were underscored with the threat of real military force. Unless the force had actually been there, the powers of Europe would not have yielded. This demonstrates the axiom that psychological warfare cannot work purely by itself; it needs force or the very real threat of force to make it effective. (The German General Staff after the war admitted that Germany's bluff could have been called, but Hitler never left the opposition (no way out). He always offered peace as the reward for non-interference in his one particular demand of the time. He never forced all demands at once, so that his enemies could look at the German armed forces, estimate the situation, estimate the cost of war, and make a reasoned decision as to whether beating the Germans or giving in were better.)

¶22. THE BLACK PROPAGANDA OF THE AXIS FIFTH COLUMN.

One of Franco's generals boasted as his forces invested Madrid: "I have five columns. Four here. And a fifth column inside the city." From this

phrase there derived the term fifth column to designate active clandestine operators. Unlike the espionage agent, the fifth columnist seeks to take an active part in the war. He may perform sabotage, instigate rebellion, launch whispering campaigns, prepare for an uprising. The spy has two main jobs: to find fact; to communicate it. The fifth columnist has one job: to make trouble. Whenever Hitler's war of nerves against the democracies struck at morale, the morale was already readied for his blow. His agents sowed dissension throughout Europe and--to a lesser degree--the rest of the world. One of their main functions was black propaganda. This was not Nazi propaganda except in the sense that the Nazis paid for it and expected to benefit by it. It might be any kind of propaganda which heated up the controversies in the anti-Nazi camps. It might take the form of anti-Nazism, provided it did so in such a way as to defeat its purpose. Many of its instruments were unconscious of its Nazi origin. In the early part of World War II, the situation was complicated by the fact that the Communist clandestine operatives had the same short-range goals as the Nazis: discredit of the capitalist democracies, denunciation of the imperialist war, and so forth. With the entry of the Soviet Union into the war, the Communist propaganda line shifted over to support of anti-Nazi military operations.

The fifth column is considered to have made a major contribution to the fall of France. In Norway, a minority of ultra-patriotic fanatics under Vidkun Quisling helped the Germans occupy the country. The tactics of the fifth column cannot be summarized: they involved cutting communications, telephoning false orders, destruction of bridges, calling of strikes, and anything else which would work certain mischief. (Popular writers, since the invention of the atomic bomb, have predicted that a major duty of future fifth columns will be the concealment of atomic bombs in enemy territory. If these were radio-sensitive, one dash on the right wavelength would send the enemy cities white-hot into the stratosphere.)

¶23. POLITICAL WARFARE. Political warfare in World War II was more obvious and less effective than in World War I. Many countries had two governments (India, France, Holland, the Philippines); some even had three (Yugoslavia, Poland). Appeals for support of these governments were made by every available propaganda means. The United Nations sometimes had the government-in-exile (Norway, Holland, Luxembourg); sometimes the Axis had it (Provisional Government of Free India). The three-cornered character of political warfare arose from the presence of rival democratic and Communist governments, both on the United Nations side. The chief lesson learned by all participants was the fact that when a country is occupied, a certain percentage of the population, however small, is going to show improper private ambition and volunteer to serve the enemy; the conquerors, far from having to prepare quisling governments in advance, were almost universally embarrassed by the different cliques of traitors who volunteered to serve the occupying powers.

- Parce que** ils ont compris que cette guerre n'est pas un simple conflit entre nations, mais bien le heurt de deux idéologies. D'un côté, un peuple qui vient d'accomplir sa révolution sociale et de l'autre, l'internationale Judéo-capitaliste qui, non sans angoisse, voit se lever l'aube d'un renouveau qui n'est pas sans danger pour nos intérêts.
- Parce que** ils vomissent notre race, la race juive, et qu'ils veulent la mettre, une fois pour toutes, dans l'impossibilité de poursuivre son œuvre de corruption et de désagrégation.
- Parce que** ils veulent éliminer définitivement les ploutocrates et autres parasites qui vivent de la sueur du peuple.
- Parce que** ce sont des hommes virils, sains et dynamiques qui méprisent les «zazous» qui sont le produit d'une société en pleine décomposition.
- Parce que** ils ont vu le bolchevisme chez lui et parce qu'ils ne le veulent pas en France; parce qu'ils connaissent la bestialité et l'effrayable asservissement de ceux qui vivent sous notre despotisme.
- Parce que** ils veulent pour leurs travailleurs le respect auquel ils ont droit, en même temps que l'assurance définitive d'une EXISTENCE DIGNES.
- Parce que** ils veulent une Europe unie qui ne s'épuisera plus tous les 25 ans dans une tuerie atroce pour les besoins de notre coffre-fort.
- Parce que** ils veulent pour cette Patrie, à laquelle ils ont voué leur vie, une place de choix dans l'Europe de demain.
- Parce que** nous sommes des destructeurs et qu'ils appartiennent à la race des constructeurs.
- Parce que** fiers de leurs traditions et d'un passé glorieux, ils veulent balayer tout ce qui causa leur médiocrité et CONSTRUIRE LEUR AVENIR.
- Parce que** leur foi est inébranlable et parce qu'ils ne déposeront pas les armes avant le triomphe final.
- Parce que** ce sont des soldats héroïques, aussi humains dans la paix qu'ils sont courageux au combat.
- VOILA POURQUOI J'ACCUSE LES HOMMES DE LA WAFFEN-SS.

Illustration #2. German leaflet attempting counterpropaganda to Allied radio broadcasts beamed at France.

¶24. RADIO PROPAGANDA. In Europe, especially, the widespread possession of radio sets made it possible for the belligerents to use standard-wave radio broadcasting as a regular means of getting propaganda into enemy territory. The following, in approximate order of importance, were the materials transmitted:

- a. Official speeches by government leaders.
- b. Official communiques.
- c. News of the world, most of it true, but so arranged as to favor one side or the other.
- d. Special features (regular lectures, debates, "educational programs").
- e. Regularly scheduled commentators (either white or black).
- f. Ostensibly private or independent speakers.
- g. Black stations (British-sponsored "Gustav Siegfried Eins"; German "Lord Haw Haw"; American "Operation Annie").
- h. Planted or falsified news quoted from its ostensible source by official radio, while the official radio disclaimed responsibility.
- i. "Ghost" voices or programs, cut in on an enemy wavelength either while enemy radio was on the air or when enemy stations went off because of air raids.

Jamming was not found to be successful except as an interference; it never interdicted all listening to the jammed stations. More feasible anti-radio measures were those taken to prevent use of materials heard over the air; listeners were punished or killed in Axis Europe. Since radio propagandists on both sides counted on the indirect audience (people who were told what the radio had said), restriction of propaganda to the direct audience (people who actually heard the broadcast) amounted to a definite control.

¶25. COUNTERPROPAGANDA AGAINST RADIO. On-the-ground counterpropaganda was attempted. Newspapers on each side were given materials with which to confute radio claims of the enemy. The strength of the democracies showed in that the British and Americans could talk the matter through in their domestic propaganda media, while the Germans and Italians, having made all domestic publishing into propaganda, had no

impartial-looking agency to which to carry an appeal against propaganda. The anti-radio measures included poster and leaflet operations. Illustration #2 shows a German attempt to refute Allied claims that the Waffen-SS (militarized Hitlerite elite guard) was a gang of thugs and murderers; the German leaflet shows the enemy broadcaster as a Jew saying, "I accuse the men of the Waffen-SS!"--of such things as believing in the future, wanting to help France, preventing recurrent world wars, being heroic soldiers.

¶26. TYPES OF CIVILIAN AUDIENCES. Civilian audiences for both radio and leaflet propaganda were often divided into five categories:

- a. The home audience;
- b. Allies;
- c. Friendly or impartial neutrals;
- d. Enemy satellites and hostile neutrals;
- e. The enemy audience.

Different programs had to be worked out in each case.

¶27. THE PROPAGANDA OUTPOST. For home, allied, and neutral audience, it was possible for the propagandists to move into the city with the audience, to rent an office, go talk to local newspapermen, make arrangements with local theaters, and carry on through the normal procedures of publicity. The picture exhibit and the "cultural" enterprise were among the major undertakings. (Things which were not entertaining enough to be called recreation were frequently listed as "culture"--specialized lectures, exchange of professors, etc.) The propaganda outpost possessed the inestimable advantage of direct contact. When the outpost was in a neutral country, it provided a channel through which material could be given to visiting enemies; or the neutral press, circulating in enemy territory, could be primed with items calculated to do psychological harm to the enemy.

¶28. NEWS LEAFLETS. For both civilian and military enemies, news was one of the main forms of United Nations propaganda against the Axis and enemy-occupied countries. The free nations had a more open news policy, so that the Germans could not use news as freely in reprisal. For civilian audiences, this took the form of miniature airborne newspapers dropped over the enemy by plane. When the military situation became static, such newspapers were dropped on enemy troops as well (see Illustrations #6 and #10). When great events occurred, it usually was found more impressive to get out a special news leaflet summarizing the event. Often these were prepared in advance (D-Day; Russo-Japanese war; fall of Paris); sometimes they had to be worked out at top speed (Roosevelt's death; atomic bomb; Japanese offer to surrender).

¶29. CIVILIAN ACTION LEAFLETS. Leaflets sometimes requested the civilians to perform a specific function. Leaflets like those shown in Illustration #8 were dropped over Occupied China to deny the Japanese the use of Chinese labor in maintaining his line of communications. Since much of the Japanese logistics depended on local help, this was a major undertaking. The propaganda leaflets from the OWI-CBI, distributed by the 14th Air Force, called for the Chinese to stay away from railroads and the texts told the Chinese that their American friends did not desire to bomb them. This was perfectly true. Coolie transport columns sometimes disappeared overnight after being peppered with such leaflets, leaving the Japanese sitting in the middle of nowhere with more gear than they could carry. The cover illustration is another action leaflet, calling for help to be given downed American flyers.

¶30. CIVILIAN MORALE LEAFLETS. Leaflets which had neither news nor special action calls often aimed at enemy morale as a whole, to run it downwards, or at allied morale, to keep it up. Morale leaflets, when effective, most commonly exploited some definite enemy weakness, such as lowered rations, the execution of hostages, denial of furloughs to enlisted fathers.

¶31. BLACK LEAFLETS. Often an enemy situation would arise in which black leaflets could be used. If the enemy issued a complicated new ration card, the dropping of a few million forgeries was certain to embarrass his rationing. Official-looking imitations of enemy documents were dropped, giving "secret" orders to do something highly distasteful to the enemy population. Sometimes an enemy newspaper would be duplicated. Handbooks for malingerers were used by both sides. Soviet propaganda developed some exceedingly handsome "militarist German" attacks on Hitler and his gang as not being Junker enough.

¶32. COMBAT PROPAGANDA. Comparable leaflets were used for strategic propaganda to troops. News and morale leaflets were of the same general types; sometimes the same leaflet was used for both audiences. Action leaflets, however, were not in most instances applicable to military personnel and civilians both. The commonest action leaflet for troops was, of course, the surrender pass or surrender leaflet. The most famous and effective of these is the Passierschein issued from SHAEF (see Illustration #11). Combat propaganda also made use of loudspeakers.

¶33. GIFTS AND NOVELTIES. A sensational but minor field of experiment concerned the dropping of matches, chocolate, needles, salt and other gifts by an air force. Countermeasures to this sometimes consisted in dropping duplicates of the enemy gift, but fixing the duplicates so as to make the receivers suspicious of all such gifts (poisoned chocolate, nauseous salt, etc.).

¶34. TERROR DEVICES. A still less important range of experiment concerned the creation of terror devices--whistles attached to shells, weapon drops to imaginary undergrounds, etc. Though often interesting, these played no appreciable part in the war as a whole. The German attacks on Holland, Belgium and France made very liberal use of such methods. This field overlaps in part with orthodox military deception procedures, such as were illustrated in the post-war press photographs of dummy tanks, jeeps, etc., which were made of rubber and could be inflated.

¶35. SYSTEMATIZATION OF PSYCHOLOGICAL WARFARE. The major development of psychological warfare during World War II may perhaps be summed up in terms of its systematization. The war brought forth few wholly new devices, outside of the use of radio. The novelty consisted of the close integration of psychological warfare with national policy on the one hand and with military operations on the other. All major participants, to a greater or less degree, utilized military propaganda units as aids to field operations. The increased use of air power made possible the dissemination of leaflets, pamphlets and occasional books on a tremendous scale. Fitting all these operations to the national governments, the theater or field army headquarters, all appropriate military echelons, and then coordinating propaganda operations one with the other was a task which could not have been accomplished without the plentiful use of the radio and the duplicating machine. World War II made psychological warfare a continuous, systematic, and purposeful part of the general conduct of war. (See Paragraph 58.)

¶36. CONSOLIDATION PROPAGANDA. The value of psychological warfare did not end with the cessation of hostilities. Consolidation propaganda, carried out under the authority of the military headquarters in charge of occupation, proved invaluable in conveying commands of the occupying power to the populace concerned. By the use of propaganda, cooperation was ensured much more swiftly; greater public interest was aroused; and persons friendly to the occupying power were given a chance to step forward and to assist the occupation. In the case of friendly or dubious areas, consolidation facilities put local publishing and broadcasting back on schedule and assured the military of a means of getting help from the people.

IV. Propaganda Analysis

¶37. COLLECTION. Propaganda analysis is valuable to the non-propagandist as a source of news and intelligence. The news or intelligence is in turn valuable for two unrelated purposes: first, for the indication of national or military policy which the attempted mission of the propaganda itself either forecasts or indicates; secondly, for the incidental content of factual material which is used to make up the propaganda. In order to analyze propaganda lines and to glean the valuable fact out of the propaganda material, it is necessary to collect the propaganda. This depends, in difficulty, on the remoteness of the area covered, and on the controls involved. In peacetime, a great deal of propaganda can be acquired by the process of subscribing or even asking for it. In wartime, propaganda collection must be undertaken along with ordinary military intelligence collection from the enemy home area; from neutral areas, it can be gotten by ordinary means; in one's own territory, the only problem is that of definition. Radio materials can be collected by having a living monitor listen to the programs, writing them down or summarizing them, or by making recordings of appropriate material and processing them at leisure.

¶38. MONITORING. Since even the non-propagandist cannot use propaganda analysis unless it deals with up-to-date (sometimes up-to-the-minute) materials, good monitoring is essential. Signal Corps receivers require no modification unless recordings are to be made. Monitoring of radio material simply consists of putting it down in convenient form.

¶39. SPOT ANALYSIS. The psychological warfare operator takes the most current propaganda materials and prepares a brief summary of the news content and of the probable motive of the enemy for using that particular propaganda at that time. (See Paragraph 45.) He is then in a position to develop his own propaganda with reference to the propaganda situation as seen by the enemy. Slavish submission to enemy initiative is a bad idea in propaganda. Normally, the sound operative uses the spot analysis for his own information, but he does not necessarily try to confute enemy propaganda point by point. He tries to counter with strong, independent propaganda lines of his own.

¶40. AREA ANALYSIS. More systematic propaganda analysis requires the collection of all available propaganda materials from a given area for a specific period of time. These materials are then broken down in terms of media which they employ, and each is searched for the probable

motive of the issuer. In a large, free country like the United States, this is a very difficult and complicated task. In a nation which has a dictatorial or one-party government controlling all media of communication, or in a small nation, it is possible to work out an analysis of the major propaganda pressures operating within the country.

When a whole nation is too large an area, the area of analysis can be cut down by procurement of materials from a single city, province, or zone. The important point about area analysis consists of getting a representative sampling (such as all the newspapers published in Rome or Munich or Shanghai on a given day).

¶41. TIME OR DEVELOPMENT ANALYSIS. In order to find out what a single propaganda source is doing, the source should be covered day by day, week by week, or month by month. The content of the source can be broken down into percentages (of time, for radio; of columns or square inches, for printed material). The emphasis will become plain as soon as the different percentages are noted on ordinary graph paper. Further study will show what the source is trying to accomplish with each emphasis.

¶42. STRATEGIC PROPAGANDA ANALYSIS. For generalizations about the over-all opinion of a given national group, it is necessary to count as propaganda everything to which the persons concerned have access. For these purposes, it does not matter whether movies have a propaganda slant or not; the fact that 69 percent may have no propaganda slant will itself be a propaganda factor of prime importance. The propaganda presentation consists of all public information to which the persons concerned have access. The propaganda operator must consider the propaganda presentation--that is, his own materials and all other public communications, whatever the kind--before he can even guess the success of a given technique. National morale (before, during, and after war) cannot be gauged by a single propaganda source, but must include a scheduled appraisal of all the contributing factors to the public opinion of the nation concerned.

¶43. PROPAGANDA IDENTIFICATION. The propaganda analyst will find that there is no magic formula by means of which he can unfailingly identify propaganda. Human beings are highly communicative and almost all two billion of them talk a great deal of their waking time. Propaganda is distinguished from conversation, education, private quarrels, recreation, romance, ordinary monologues, etc., by the fact that it is communicated intentionally. It is not the content of the communication, but the motive which impels it, which distinguishes propaganda from non-propaganda. This is like saying that propaganda is propaganda when it is propaganda; to a certain extent this unsatisfactory definition is correct.

However, few communications come from completely unknown sources; when they are, they are often mistrusted. The propaganda analyst must therefore take into account the source, whether ostensible or real, the timing, the people to whom the communication is addressed, and the probable effect which that communication will have on those people at that particular time before he can find the source, if the source is hidden. If the source is not hidden, the whole process is out in the open. (See Paragraph 45.) Thus, even with a hidden source, it is feasible to work back to the probable source by analyzing the probable effect.

¶44. PROPAGANDA VERSUS TRUTH. Good propaganda does not make use of lies. Good propaganda is truthful, except in very extraordinary circumstances. Good propaganda uses the truth selectively. It directs to the audience those truths which will accomplish the results which the propagandist seeks, and withholds those truths which accomplish no particular purpose. To test for propaganda by looking for lies is therefore impractical and unprofitable. The test for propaganda is a dynamic test. It must consider not only the information, but the life-history of the communication. Where does it come from? To whom is it going? Why now? What for? The statement, "People who work get paid," can be propaganda or not, depending on who says it to whom, when, why and on whose behalf. (The reader might try to develop this statement into anti-Russian propaganda by Germans, anti-American propaganda by Germans, anti-German propaganda by Russians, and anti-German propaganda by Americans. The timing, the persons to whom it is addressed, the way it is said, what is said with it--these make it propaganda or not.) There is no conflict between propaganda and truth. Good propaganda uses truth. But the highest truth, in a free civilization, not under totalitarian or ideological control, is deemed to be the truth uttered by disinterested persons who have no ulterior motive in communicating it.

¶45. THE FORMULA FOR A SINGLE ITEM. In large-scope propaganda analysis, it is desirable to proceed quantitatively. Only highly experienced personnel should attempt to weight different parts of a given output in order to guess the weighting given by the source. (The Americans may consider the 1000-hours news program the best item off Radio Nirgends; the Nirgends themselves may not have thought of that program as their best. Hence, qualitative weighting, unless source itself gives very plain clues, such as using a front page or picking a popular listeners' hour, is dangerous for effective analysis.) When a single item is to be broken down, a careful propaganda analysis formula could be developed on the basis of the following outline;

COMPLETE BREAKDOWN OF A SINGLE PROPAGANDA ITEM

a. Source

- (1) True source ("where does it really come from?")
 - (a) Release channel ("how did it come out?") if different from true source without concealing true source
 - (b) Person or institution in whose name material originates
 - (c) Transmitting channel ("who got it to us?"), person or institution effecting known transmission--omitting, of course, analyst's own procurement facilities
- (2) Ostensible source ("where does it pretend to come from?")
 - (a) Release channel ("who is supposed to be passing it along?")
- (3) First-use and second-use source (first use, "who is said to have used this first?"; second use, "who pretends to be quoting someone else?")
 - (a) Connection between second-use source and first-use source, usually in the form of attributed or unacknowledged quotation; more rarely, plagiarism
 - (b) Modification between use by first-use and second-use sources, when both are known
 - (i) Deletions
 - (ii) Changes in text
 - (iii) Enclosure within editorial matter of transmitter
 - (iv) Falsification which appears deliberate
 - (v) Effects of translation from one language to another

b. Time

- (1) Time of events or utterance to which subject-matter refers
- (2) Time of transmission (publishing, broadcasting, etc.)
- (3) Timing of repetitions
- (4) Reasons, if any are evident, for peculiarities of timing

c. Audience

- (1) Intended direct audience ("in English to North America"; "a paper for New York restaurant operators")
- (2) Intended indirect audience (program beamed "in English to North America" but actually reaching Hongkong and Singapore by deliberate plan of the sender; "a paper for New York restaurant operators" being faked and sent to Southeast Europe in fact)
- (3) Unintended audience (a Guadalcanal native studying Esquire; your aunt reading the Infantry Journal; a Chinese reading American wartime speeches against the "yellow devils" of Japan)
- (4) Ostensibly-unintended direct audience (such as an appeal to strikers in very abusive-sounding language, sent to businessmen to build up opinion against the strikers, or Hitler's use of the fake Protocols of the Elders of Zion)

d. Subject ("what does it say?")

- (1) Content listed under any convenient heading as though it were straight news or intelligence
- (2) Content epitomized as demonstrating new propaganda technique (such as, "now they're trying to get us out of Tientsin by appeals to our isolationists!")
- (3) Content which may be useful in counterpropaganda (such as, "they said that the Greeks are our witless puppets, so let's pass that along to the Greeks")
- (4) Significance of content for intelligence analysis (example: when the Japanese boasted about their large fish catch, it was an indication their fishing fleet was short of gasoline again, and that the fish catch was actually small; when the Nazis accused the Jews of sedition, it meant that rations were short and that the Nazi government was going to appease the populace by denying the Jews their scanty rations by way of contrast)

e. Mission

- (1) Nation, group, or person attacked
- (2) Relation to previous items with the same or related missions
- (3) Particular psychological approach used in this instance (such as wedge-driving between groups, or between people and leaders, or between armed services; or demoralization of audience in general; or decrease of listeners' faith in the news)
- (4) Known or probable connection with originator's propaganda plan or strategy

This outline may be remembered by the initials of the key words--the five main headings in order--as the STASM formula. The outline is not final or authoritative, and propaganda analysis performed for governmental or military establishments should, of course, conform to the schedule prescribed in the agency concerned. Used in conjunction with a quantitative graph, however, an outline of this type will in the course of use provide a reasonably complete index to the operations of any person, party, group, or government.

¶46. PROPANAL AND FOREIGN OR ENEMY MORALE. Propaganda analysis is sometimes called propanal for short as an administrative convenience; propanal can be used as an intelligence tool of prime importance. A person desiring to spy out just what sickness an ill man had could do so by waiting at the pharmacist's and seeing just what prescriptions were being taken to the patient; similarly, conditions in a foreign (in wartime, even an enemy) country can be systematically guessed, with a high probability factor in favor of the analyst, if the domestic propaganda of the government concerned is analyzed. The home government of any country uses

propaganda--whatever it may be called for courtesy's sake--as a tool of government. Careful scrutiny of what the propaganda is designed to do will give indications of what is wrong inside the country concerned. Few nations, for example, are capable of waging aggressive war without getting their own people ready for war. If a foreign country accused the United States to its own people of being power-mad, imperialistic, meddlesome, threatening and aggressive, while broadcasting to us nothing but fairly calm news materials, it might indicate that:

- a. The country was preparing to launch a surprise attack on the United States, the leaders using our alleged aggressiveness as preparation for the statement, "The Americans shot first!", while not exciting us any more than possible, before the attack; or
- b. Conditions in the country concerned were so bad that the leaders tried to calm internal discontent by provoking the U.S. into a mud-slinging contest, which would fill the front pages of the papers and would rally the people behind their government.

The utterances of a controlled press or controlled radio in an unfree nation always mean something; nothing is done spontaneously or privately for private enjoyment. Government control is directed at given purposes. Propanal can uncover most of those purposes.

¶47. PROPANAL AND MILITARY INFORMATION. Military information can be derived from the tone, timing, emphasis, and purpose of enemy broadcasts. The Germans predicted a new, secret weapon before they used the V-1; the German predictions dropped off when the launching ramps on the French coast were bombed; when the ramps were repaired, the predictions went up in number. This helped to confirm the supposition that the ramps had an organic connection with the secret weapon which Goebbels and Hitler had promised. General enemy intentions and commitments can be measured against propaganda; propanal becomes a useful auxiliary source when the propaganda habits of the source are well known.

V. Propaganda Intelligence

¶48. THE PECULIAR RESPONSIBILITY OF PROPAGANDA. Propaganda must compete with hostile or private news facilities, but (in the case of "white") must at the same time be issued on the responsibility of the government or army concerned. Propaganda must be checked not merely for its correctness as news, and its usefulness on the immediate propaganda schedule, but for its effect on the issuing government. Propaganda must not offend domestic persons, groups, interests, or minorities of any kind; propaganda must not offend one audience for the sake of winning a point with another; propaganda makes the issuing government accountable to world opinion. Therefore, propaganda cannot be operated the way that a newspaper is operated, or a radio news program; it must be checked for:

- a. Factual correctness;
- b. Propaganda effect on the occasion of use;
- c. Propaganda effect to other audiences or groups not addressed;
- d. Relation to the actual policy of the issuing government on the topic concerned;
- e. Effect if used in hostile programs and quoted against its source;
- f. Coordination with military security, where applicable;
- g. Ownership of the material, if copyrighted or borrowed from a private source;
- h. Relationship to future propaganda, political, or military plans.

Propaganda is therefore difficult to execute, when it is good. It is one of the most complicated of governmental processes. (The more private the propagandist is, the more satisfaction he can allow himself by being inventive, and the less he has to worry about clearances, authority, permission, and so on. That he is also less effective, goes without saying.)

¶49. THE RAW MATERIAL OF PROPAGANDA. Propaganda requires two kinds of material: news or background materials, out of which to build the propaganda; and guidances or plans, with which to steer it. Propaganda must reach an audience; to reach the audience it must interest them and hold their attention; to hold their attention, it must say something; to say something, it must have something to talk about. (This was not always understood in World War II, with the result that some propagandists broadcast longwinded, tedious political arguments while all over the world click, click, click, their listeners cut off the current.) Propaganda content must reach the audience, but in so doing it must not give away secrets, make fools of the propagandists, or involve the government in difficulty.

The controls must go along with the raw materials. The actual propaganda operator should be given the news as fast as possible; he should be given such background information as he may need to make his presentation sound; but he cannot be trusted, because of the strain of his job, which keeps him in touch with the enemy, with information of high security value. How to control the propagandist without spoiling him at his creative job--how to guide him without interfering unnecessarily in his work--how to watch him without slowing down the actual output--how to observe all controls and regulations while staying up-to-the-minute on schedule: such problems are not readily solved. Yet they must be solved, if the propaganda is to work. Without intelligence materials and guidances, propaganda becomes an expensive and ephemeral kind of literature, giving neither credit nor profit to its authors, and maintaining no particular advantage to the government which pays for it.

¶50. AUDIENCE INTELLIGENCE. Propaganda must be directed at specific goals. It must be conducted with reference to a known audience, taking the characteristics of the audience into account. It must meet the current opinion of the audience addressed. Therefore, all intelligence concerning audience opinions, reactions, fads, slang, rumors, new interests, etc., must be relayed to the propagandist if he is to do his job well. (The Japanese in World War II occasionally showed their lack of such intelligence materials by referring to things which were hopelessly out of date. More frequently they missed their cue by failing to understand actual conditions in wartime America. All they knew was pre-war America.)

¶51. OPINION ANALYSIS. The interrogation of prisoners and, under ideal conditions, the interrogation of enemy home opinion will give indications of enemy morale and of the fluctuations of opinion in the target country. Opinion can also be found negatively by watching the antagonistic propaganda and seeing what things it seeks to oppose or to correct; those very things can thereupon be reinforced by appropriate propaganda measures.

Illustration #3. Domestic Japanese wartime propaganda cartoon directed against Britain and the United States. Such material gave American leaflet-writers models for their leaflets prepared for Japanese audiences.

VI. Propaganda Technique

¶52. PROPAGANDA DISCIPLINE. Basic to all psychological warfare is the discipline of the operative. The participant, military or civilian, who says what he himself wants to say should obviously be thrown out of a propaganda outfit and transferred to some enterprise where he can talk to his heart's content. The whole purpose of propaganda rests upon saying things which the enemy wishes to hear but which, when heard, will damage the enemy war effort. This requires the propagandist to keep his own emotions and opinions under strict discipline. All the rest of his government or army can hate the enemy all they wish; wartime is the season for lawful hatred; there is no reason why they should not hate the enemy. The propagandist has the job of persuading the enemy not to fight. To do so, he must remain sympathetic to the enemy. Jeering, name-calling, reproaching, criticizing without purpose--these should never depend on what the propagandist thinks the enemy deserves to have said to him, but on what the propagandist thinks will affect the enemy's thinking, feeling, and action. The propagandist can denounce the enemy--when the propaganda plan calls for it. He can express his hatred and contempt--if hatred or contempt are on the schedule. Normally these are not. Most of the time, he must play the role of being the sympathetic enemy. Propaganda discipline (first of the individual over himself, then of the outfit over the individual, whether civilian or military) is the first pre-condition of successful psychological warfare. Violation of discipline produces dangerous adverse reactions.

¶53. SCIENTIFIC AIDS. Basic historical, economic, political, social, religious and other data concerning the audience should either be inside the propagandist's head, or else in convenient reference form. (Americans would not think much of enemies who addressed Louisiana troops with, "Hello, Yankee!" under the impression they conveyed a sense of cheerful friendliness, nor would they be impressed by a pamphlet which showed Mother polishing her son's shoes while he lolled in a porch swing, saying, "Gee whiz, I'm glad to be home, mamal!" Bad propaganda is worse than no propaganda; good propaganda requires correct background.) Knowing the language does not of itself indicate that the propagandist is ready to start; even being a native or ex-citizen of the country concerned is not a guarantee that the person is qualified. Most Americans speak good American English; most of them know a lot about America; not many of them are capable of becoming first-class radio commentators or great authors. Sound psychological warfare operations depend not only on good language facilities, and on the possession of cadres of personnel with a first-hand

intimate knowledge of the audience, but on scientific aids as well. The research of anthropologists, psychologists, sociologists, political scientists and historians provides a body of material on almost every group in the human race. Properly used, these scientific aids will bring to light enemy weaknesses and traits which even the most acute untrained observation would not reveal.

¶54. THE LISTENER. It is sound propaganda, in most cases, to presume a single listener or reader as target. Propaganda should be personal, emphatic, direct, simple, reiterative. Few radio programs or leaflet series can count on hitting the same man regularly enough to build up grandiose cumulative effects. The more concretely the one-man audience at the other end is visualized, the better his worries and hopes are understood, the more that he feels the propagandist "talks his language" with more than words, the more successful the operation will be. Propaganda has little room for the general, the abstract, the formal, or the large-audience appeal. It must get inside somebody's skin; to do so, it must keep the target individual in mind. The only time for formality is the occasion when the listener, by his own customs, expects it. (Note the correct Japanese reaction when President Roosevelt died. The Germans, gibbering with hate, called him nasty names and offended Americans. The Japanese, in a formal, silly, naive but appealing way, extended their condolences to the American people. American public opinion mocked them for doing it, but their action on that occasion helped build up a picture--later to become useful to them--of the Japanese as incomprehensible, gauche, but with all their faults a very courteous people. The Japanese considered their American listener; the Germans forgot and amused themselves, attaining no real advantage.)

¶55. SPECIFIC TECHNIQUES. Specific techniques are among the trade secrets of every major propaganda organization. Some of them are found in the academic literature on propaganda (see Chapter IX). Most of them are evident to common sense. The goals dictate the technique to be used in each concrete situation; some of the permanent goals are to prepare the enemy for defeat in war, to disunite enemy opposition, to promote belief in the utterance of the propagandist, to discredit enemy news sources, to make the individual enemy feel he has friends on this side.

VII. Wartime Propaganda Administration

¶56. WARTIME CIVILIAN AGENCIES. In the United States government, war propaganda has traditionally been a function of the executive branch of the government. Though a responsibility and power of the President, it has not been conducted by President Wilson or President Roosevelt in their respective capacities of commander-in-chief of the armed forces, but has been operated as a special, emergency, civilian enterprise in each war. In World War I, there was established the Creel Committee. In World War II, psychological warfare was at first a responsibility of seven or eight agencies, the most active being the Office of the Coordinator of Information (COI) and the Office of Facts and Figures (OFF). In the summer of 1942, the OWI was established and took over most psychological warfare functions, particularly all those involving official use of the name of the government; other agencies, such as the Office of Strategic Services (OSS) and the established departments, maintained an interest in the subject. Coordination was effected by a system of consultation and liaison, as shown in the chart on page 29. At the termination of hostilities, both OWI and OSS were dissolved. Some of their informational and research functions have been assigned to the State and War Departments.

¶57. FUTURE PROPAGANDA ADMINISTRATION. Psychological warfare cannot be studied on the assumption that appropriate staff procedures will involve civilian agencies. Since the national agency for propaganda has been improvised for each war, with very little carry-over of doctrine, skill or personnel from one war to the other, it must be considered that another war, should one occur, would require new organization. This might or might not be military. Experience in World War II showed excellent results in the use of large civilian staffs under military command.

¶58. MILITARY FUNCTIONS OF THE NATIONAL PROPAGANDA AGENCY. A national propaganda agency has as its primary job the securing of the home front by sound, effective, honest domestic propaganda which will maintain national morale, support production and keep the national base of the military effort in good condition--so far as this can be done through affecting opinion. The national agency must necessarily serve as the gather and supply point for special news, features, guidances, background studies and so on which are needed by military propaganda facilities overseas. It also has the exceedingly important function of supplying presses, special radio equipment, inks, basic propaganda materials and other supplies which cannot be drawn through ordinary army channels. The OWI in World War II--and the Creel Committee to a lesser extent the time before--per-

formed the indispensable function of finding personnel with the unusual qualifications required for psychological warfare, re-training them, and putting them on either its own or the Army payroll. (Finding an eloquent Pushtu-speaking person in a hurry is no easy task!) Finally, the national agency did a great deal of the onerous fiscal and bookkeeping work, and carried much of the budget load for psychological warfare.

¶59. MILITARY-CIVILIAN COORDINATION. Some of the worst possible blunders of psychological warfare are those which can be committed when there is poor civilian-military coordination. During World War I, the Kaiser's government never succeeded in setting up effective coordination between the military and political agencies of government for propaganda purposes; the British had great difficulty before they worked out a smooth administrative and consultative machinery for the purpose. In between wars, the Japanese lost a great deal of ground because of a lack of such coordination; the government spokesmen promised that troop action in the "China Incident" would halt; the next day the Army would move forward, and Japan got a reputation for calculated trickery only half of which was deserved. Part of their effects were the result of guile and wile; part were the consequence of administrative confusion and independence of the armed services. Hitler, in contrast, achieved in his psychological warfare the smoothest military-political coordination which has yet operated on a grand scale; he had total control of the government and people to start with. In the United States, such coordination was achieved to a much less extent than in Germany.

¶60. GENERAL PLANS. Proper coordination of psychological warfare facilities permits the setting up of general plans which are coordinated with both strategy and national policy. Hitler's propaganda worked in intimate liaison with his military and air headquarters; when an operation such as the conquest of Poland was undertaken, the propagandists were able to time their operations so as to be most useful to the combat elements. Long-range purposes could be sought by clandestine operations and "white" operations supplementing one another. Quislings, for example, could be recruited by the Germans at any one time, but they would not keep over a long period of peace without undergoing changes of heart, twinges of loyalty, some desertions with attendant breach of security, and other deterioration. Coordination of all facilities gave the maximum result.

¶61. CONTINGENCY PLANS. Foreseen contingencies are planned in propaganda. An invasion, a landing, the surrender of an opponent, the fall of a city--such news occasions call for special radio and leaflet operations. These too require coordination between various national-level or general staff agencies, whatever the particular propaganda structure of a country may be. In totalitarian countries, the single party must be included so as to provide for appropriate "spontaneous joy," "mass demonstrations," and so forth.

CHART OF PROPAGANDA ADMINISTRATION IN WORLD WAR II (1942-1945)

* The War Department agency was the Psychological Warfare Branch, 1941-42; liaison officers, 1943; Propaganda Branch, G-2, 1943-45.

Not shown on the chart are the consultative relationships established between OWI headquarters, Washington, and the Joint Chiefs of Staff, whereby liaison officers from the War and Navy Departments kept in appropriate relationship to OWI in preparing psychological warfare plans and guidances.

¶62. SPECIAL PLANS. Unforeseen contingencies often call for special plans. Emergency consultation facilities must be provided, whereby the propagandists can be called upon to exploit an opportunity before the time passes. To this end, most nations in wartime have propaganda duty officers who are available around the clock; where military and civilian instrumentalities are both employed, duty officers are needed in each.

¶63. APPLICATION OF PLANS AND ORDERS. If plans are highly classified and do not reach the actual producers of propaganda, they are of little value. Propaganda output is measured in terms of the actual newscasts, features, radio scripts of other kinds, leaflet texts, poster appeals and other definite writing tasks. These must be written, translated, and broadcast or printed. The net output of propaganda is made up of the work of the people who perform the practical tasks. In ordinary combat operations, it is perhaps desirable for an infantryman to know as much as feasible about the strategic and tactical mission on which he is engaged, but it is not a condition of his effectiveness. Commands can be filtered down to him, without the reasons accompanying them. Direct command does not usually apply in artistic or literary work such as propaganda. Plans must accordingly be translatable into specific do's and don't's (usually called guidances). To be genuinely practical, guidances must be:

- a. Plain and unambiguous.
- b. Organized for ready reference.
- c. Dated, with automatic expiration.
- d. Mandatory.
- e. Non-security or low-classified.

The last provision is made necessary by the fact that the propagandist, being in constant touch with the enemy, is always in danger of giving away his purpose; furthermore, propaganda personnel must be recruited from among persons familiar with the enemy or antagonist. This signifies that the best propagandists are those who have a great deal of sympathy for enemy customs, thought-patterns, and ideals. They do not necessarily prove disloyal, but it is plainly unsound to burden such persons with important or secret information.

VIII. Combat Propaganda Operations

¶64. COMBAT PROPAGANDA ORGANIZATION. During World War II, some theaters never extended systematic psychological warfare organization below the theater headquarters level. Others established elaborate operational units, of which the most ambitious were the First and Second Mobile Broadcasting Companies. These worked in North Africa, Italy, and France. It was found that they functioned best when their component elements were broken down into smaller teams. The ultimate pattern in almost all instances consisted of the creation of a small producing center (in SHAEF, PWD ran into the hundreds; in China, the staff for psychological warfare was not over a dozen men till the last months of war) which was capable of composing and printing leaflets. Leaflets produced in the United States, with the actual printing matrices sent to the theaters, were not successful; they were too remote from theater problems; the consequence was that leaflet production became the backbone of each theater or, in the case of Europe, Army propaganda headquarters. Occasional tactical leaflets were produced by smaller units, sometimes being mimeographed by an officer single-handed, but in most cases the leaflet-printing function remained a major task. The Davidson and Webbenderfer presses, which were used, are not very mobile, and paper supply is a constant logistic problem.

¶65. PSYCHOLOGICAL WARFARE COMMAND. Each theater commander was in complete charge of psychological warfare so far as its use or non-use was concerned. He also controlled the entry into his command of civilian propaganda personnel. Theater commanders did not possess authority to change national propaganda policy, to initiate political propaganda without coordinating with the Department of State, or to improvise propaganda without reference to the propaganda of other theaters or of the continental United States. Theater commanders sometimes used Psychological Warfare as the equivalent of a G-6, sometimes combined it with G-5, sometimes subordinated it to G-3, usually attached it to G-2, and in one instance operated it under the direct scrutiny of a Military Secretary to the Supreme Commander.

¶66. COMBAT PROPAGANDA RADIO. Radio broadcast facilities were found to be extremely valuable for strategic and consolidation propaganda. The relative immobility of even the mobile radio stations precluded their rapid shift in the course of tactical changes, and the radio broadcast facilities as such had little opportunity to reach enemy troops.

¶67. COMBAT PROPAGANDA MONITORING. Monitoring by combat propaganda units was found to provide invaluable materials for loud-

AT FIRST IN THE WEST:

Rundstedt's offensive of desperation smashed!

AND NOW IN THE EAST:

East Prussia cut off!

The Red Army deep in Silesia!

Germany's "Eastern Ruhr" paralysed!

Zukov's Armies West of Posen

**Evacuation of Government and Party
Offices from Berlin has started!**

Illustration #5. Two types of news leaflet. The illustration announced V-E Day to the Japanese, and was prepared in advance; text is on the back (not shown). The printed leaflet is an English facsimile translation of one dropped on the Germans; on the back there were statements from Churchill and Roosevelt.

N. 1

A Weekly for American Soldiers

Highlights on the Crimea Conference

60 truckloads of chocolate-colored boys from North Africa, yes, real natives from the dark continent, arrived the other day as your neighbors to the east of you. They are going to help you as liberators to bring the culture of darkest Africa to those God-forsaken Germans who know nothing about it. Congratulations, they are your friends and allies even if they cannot read or write with their knife and fork.

Conference and it was plain that Roosevelt had been defeated there. Also the US Senator was pessimistic in connection with the Conference. Although he couched his words in more diplomatic language when he said that the Crimea Conference had given no clue whatever to an early end of the war, he also said in an official Moscow paper - "Pravda" - expressed semi-official Moscow paper - the Conference.

[illegible]

Polish Army Corps withdrawn

Crimes of Anders, the C.O. of the Polish troops fighting in Italy under the command of the British, was declared in preme in the order of the day: "We shall never recognize which nation has been the victor in this war, and we shall never forgive the mercy of British and Polish soldiers for fighting for liberation and genuine independence and to reports of the American press, written by persons, unsympathetic to the Polish cause, among the troops. The Polish people to such an extent that they had to be rescued from the fighting lines.

The Divorce Question

"Red Czar" vs. "World President"

A skillfully directed propaganda campaign in the USA has successfully undertaken to make believe that the Russian army has taken over a third and that the good old Joe is nothing but a traitor in the meantime. Stalin, European countries, bourgeoisized troops, has evacuated and off to Siberia, has evacuated, Americans, Poles, Hungarians, Estonians and Finns, Russians, announcing that this is only the beginning. One wonders that the American authorities are taking unfortunate issues and whether they will not consider the victims lost and dead. The victims are being taken to however Stalin's Legionaries to die as some of your Jews are being controlled positions, horrible conditions in the Moscow was used to say. What has happened since the once famous "iron curtain" scene?

前線的日本投降辦法也已接
洽好了。

Illustration #6. Two types of leaflet newspaper. The German in English, is addressed to American troops and ties in with communist propaganda. The American paper, in Chinese, is addressed to Occu-
pied China; it is dated 1 September 1945.

Illustration #7. Morale leaflets, white and black. The white leaflet shows the Japanese propagandist ridiculing the U.S. air force to the Chinese while American planes are overhead. The black is a German item addressed to American troops (both obverse and reverse are shown).

ATTENTION ALLIED PRISONERS

Allied Prisoners of War and Civilian Internees, these are your orders and/or instructions in case there is a capitulation of the Japanese forces:

1. You are to remain in your camp area until you receive further instructions from this headquarters.
2. Law and order will be maintained in the camp area.
3. In case of a Japanese surrender there will be allied occupational forces sent into your camp to care for your needs and eventual evacuation to your homes. You must help by remaining in the area in which we now know you are located.
4. Camp leaders are charged with these responsibilities.
5. The end is near. Do not be disheartened. We are thinking of you. Plans are under way to assist you at the earliest possible moment.

(Signed) A. C. WEDEMEYER
Lieutenant General, U. S. A.
Commanding

Illustration #8. Two action leaflets and one morale leaflet. The Japanese leaflet reads, "Yearning for the native land, Forget-me-not stuck on my sleeve, Reminding me not to forget my dear old Homeland near the Kagu mountain." This type of poem is characteristically Japanese. The two action leaflets are self-explanatory; the one in Chinese is part of the same series as the one shown on the cover of this syllabus.

speaker and leaflet operations. (In Burma, American psychological warfare got news to the Japanese troops from Radio Tokyo--after editing it in passage--more rapidly than did the Japanese morale officers; Japanese music was recorded off the air in an area where no Japanese phonograph record had ever been played before.)

¶68. MORALE LEAFLETS. All leaflets were processed in a manner similar to that shown on page 38. When the tactical situation was static, morale leaflets (Illustrations #7 and #9) were used; in situations tactically unfavorable for the enemy, contingency leaflets were made up (Illustration #4) and surrender passes were distributed (Illustration #11). Morale leaflets were found to be the most difficult to write. They had to achieve the most definite effect with the least specific appeal; they involved no call to action. The effect of morale leaflets has never been calculated. Surrender and news leaflets can be tested by checking the number of prisoners who come in with surrender passes, and then quizzing them on news to find out how much came from news leaflets; but morale leaflets are not in a comparable situation, and most prisoners were found inclined to make snap judgments on how they should have felt when getting the morale leaflet, rather than how they did feel.

¶69. NEWSPAPERS AND NEWS LEAFLETS. News of common interest--progress of the war, political developments closely connected with the war, the appearance of new weapons, home news from the reader's country--provided a medium of communication which carried more propaganda than did all other means put together. News materials were used continuously, whenever the disseminator and his enemy stayed close enough or stably enough together to permit circulation. Instances are given in the Illustrations. It was found that the repetition of simple themes and slogans was basic to the effective propagandizing of the news and that news, correctly handled, never wore out its appeal.

¶70. LEAFLETS AND ORDER OF BATTLE. Order of battle information contributed tremendously to the effect of some very successful leaflets. The mention of troops by their correct unit names, reference to unpopular officers by name, correct description of enemy conditions--such devices gave the enemy troops the bewildering feeling that they had no security at all, and that the propagandist's forces were omnipotent. (Information of this kind came in great part, of course, from prisoners.) However, the mistaken or incorrect use of names, or even the delivery of the wrong leaflets to a given unit can undo much of the special effect obtained through battle order information and through the revelation of correct front-line intelligence. A simple leaflet which is sure of committing no blunder is commonly more effective than a complicated or tricky leaflet which may have unfavorable repercussions.

Production of a Tactical Leaflet (Army level)

Legend,

— Flow of material and ideas
 — Operational control

(Taken from **History of the Second Mobile Broadcasting Company**, no publisher given, issued within the unit, 1945.)

¶71. TACTICAL COORDINATION. The use of psychological warfare devices is ineffectual if the results desired are not rendered practical. For example, pursuit planes should not ask for the surrender of individual prisoners without explaining--in the leaflet--just how, where, and to whom the prisoners should surrender. Invitations to surrender must always be accompanied by control of the troops on the inviting side; if one prisoner starts across and is picked off by an over-enthusiastic sniper, other surrenders are not likely to follow: positive harm will have been done. Coordination between artillery or tactical rockets and leaflet shelling is important; the effect of leaflets can be stepped up measurably if heavy shelling is announced, delivered, lifted for the purpose of accepting surrenders, resumed, lifted again. This type of coordination requires the presence of a psychological warfare liaison officer at the regimental level or below, whether such an officer be one of the normal component trained in psychological warfare techniques or an outsider detailed for the purpose.

¶72. ATROCITY PROPAGANDA. Atrocity propaganda created a revulsion against war generally when it was employed in World War I. The audience reacted against the enemy, but the reaction consisted of nausea and nervous upset to such an extent that it is not now considered desirable to use atrocity propaganda. It may lift morale momentarily, but its long-range effect is not favorable to morale. It will be found in almost every case that rumors--resembling propaganda, except that they are not systematized to achieve a known end--will circulate in the course of operations among the troops themselves, alleging fearsome enemy atrocities. Inevitably, some of these rumors have their foundation in fact. They should not be encouraged and should be made the subject of propaganda campaigns only when the necessity therefor is compelling. It has been found that atrocity propaganda begets atrocities. An audience subjected to atrocity propaganda will react in the normal human way and will effect reprisals in kind if the opportunity offers, so that the outcome is an auction of cruelty, each side seeking to excel the other in wantonness without achieving any respectable military goal. Such propaganda makes combat operations more unpleasant without increasing their effectiveness, and it interferes with national policy in the post-war period, by leaving residual hatreds which are difficult to overcome for normal international relationships. When an enemy has in fact committed atrocities, news thereof is good propaganda only when it is desired to punish the enemy, when punishment can in fact be applied without reprisal in kind, or when publicity may have the effect of forestalling further atrocities of the same kind. (This signifies, usually, that atrocities committed against civilians or prisoners far behind the line of operations are often the appropriate subject of publicity, but that atrocities committed in the course of operations are not sound propaganda material unless compelling national policy requires their use.)

A child is weeping —

Somewhere, now, a child is weeping.
Weeping for a Daddy who never will return —
A Daddy she hardly knew or remembers but nevertheless her
Daddy.

Some little time ago her Mommy revived the dead news that
he had been killed in action in Italy. — Just one more life
sacrificed upon the altar of "big business".

Tomorrow it may be your child who weeps!
And you yourself — are you not the child of a mother who
is waiting anxiously and patiently for your return?

You may die at any moment! — Why?
Your death will do no good, and your loved ones will be
subjected to almost unbearable grief!

You know through experience what help they can expect in
the way of pensions or relief in the event of your death.
They can expect little, and invariably grudgingly given and
accompanied by endless "Red tape".

And do you think that by your death and the death
of thousands of your comrades humanity will benefit?

Of course not!

Wouldn't it be better to live and take care personally of
those you love and who love you?

It may be a Mother, a Sweetheart, a Wife or child, but some-
where someone is waiting and waiting about you.
Don't disappoint them. — take care of yourself and

go home safe after the war!

Come back home alive, Daddy!

*Ich bin
Flattermann*

**Ich bin ein
Flugblattpäckchen
und wiege fast nichts.**

Kamerad! Nimm mich mit und
geh mit weiter nach vorn!
Ich werde dem Tommy und dem
Yankee, die sie nicht so machen.

**Ich helfe
Dein Blut sparen!**

*Nimm
mich!
mit!*

Illustration #9. German black morale leaflet (small photo) and instruction sheet telling German combat units to take along a package of leaflets when proceeding to the front lines, saying "Comrade! take me along and pass me forward. I've got to get to the Tommy and the Yankee to make them soft. I help save our blood!"

¶73. FURTHER COMBAT PROPAGANDA TECHNIQUES. Loudspeakers were proved effective, especially after the Brittany operations in Europe and in the last phases of the island operations in the Pacific. Where fighting occurs along beaches, loudspeakers may be mounted on boats and run along the shore. Tank-mounted loudspeakers can sometimes be employed with results which are sensationally effective. When propaganda personnel cannot be taken in the boat or tank, it is possible to arrange a radio-telephone relay. The commander of the boat or tank describes the situation in English to the propaganda broadcaster back at the command post; when the propaganda man has the essential facts, the commander connects the radio-telephone directly into the loudspeaker circuit, and the tanks or boats begin speaking colloquial Japanese, German, Czech, Polish, or whatever language may be required. Loudspeakers are useful in mopping up; they avoid some of the waste effort and possible loss of life involved in using infantry against an enemy whose position is already hopeless, and they are more flexible than leaflets. Their range at the end of the second World War was two miles.

Loudspeakers may, in the interests of humaneness, be made available to enemy prisoners for the purpose of reassuring other enemy soldiers or fragmented units that further resistance involves loss of their lives. At Saipan and Guam, brave Japanese individuals volunteered to help save Japanese and American lives in this fashion. They spoke directly into the loudspeaker with a language officer standing by to make sure that no treachery was achieved. They were able to testify to good treatment. On occasion, the prisoners were so effective that they were given leave to return to the enemy lines, or to look for enemy units, for the purpose of bringing back others. (The Chinese forces in the guerrilla areas used this technique with audacity and astounding success. Lacking loudspeakers, they cut in on field telephones, talked propaganda at the operators, left presents at isolated sentry posts, invited exchanges of letters on the cause of the "imperialist" war, and shouted with megaphones.)

¶74. CONSOLIDATION. Leaflets, loudspeakers, posters, newspapers and local broadcasting are effective in consolidating occupied territories. Decisive action immediately upon occupation, coupled with genuinely effective supply and relief measures, will often prevent the appearance of irregular resistance measures which would involve the local populace and the occupying force in bitter antagonisms. The Germans promoted their own defeat by the arrogant, haughty, and arbitrary way in which they addressed conquered populations; a more genuine attempt to understand local populations would have involved the German army in fewer difficulties, and might have avoided such measures as outright terror; but if the Germans had been capable of such action, they would not have been Nazis and would not have conquered the territories in the first place.

¶75. PROPAGANDA EQUIPMENT. Propaganda equipment for printing is usually procured from civilian supply. A variety of presses, from the simplest stencilling machine up to offset machines capable of millions of leaflets per month, is available. Radio equipment can be supplied by existing Signal Corps materials, supplemented where necessary by civilian supply. In the India-Burma and China Theaters, there was developed a leaflet-dispensing machine built into an old auxiliary gasoline tank. All the pilot had to do was to set the controls at the number of leaflets per batch and the speed of ejection. He was then ready to fly over jungle territory, pinpointing possible enemy positions with leaflets. In ETO, there was developed the Monroe bomb, a leaflet bomb suitable for controlled dispersal from high-altitude planes. (If loose leaflets are dropped from high altitudes, they will scatter over immense territory and lose their effect.) Other ordnance and related devices are currently under study; information concerning this is available from Propaganda Branch.

Illustration #11. Surrender Passes, West and East. The standard form of each is used. Note prominent use of English on the Japanese; the stripes are a brilliant red, white and blue, since the Japanese soldiers wanted to be sure we knew they were surrendering. The German, on the other hand, had to be reassured that everything was properly official.

IX. Reading List

Books listed here are likely to be procurable at the larger municipal and college libraries. The bibliographies listed below provide a guide to further reading; a very large body of writing exists on the subject. Most of the books on World War II propaganda remain yet to be written.

- Stewart ALSOP and Thomas BRADEN, Sub Rosa: The O.S.S. and American Espionage, New York, 1946.
- Heber BLANKENHORN, Adventures in Propaganda, Boston, 1919.
- [E. G. BORING, editor], Psychology for the Fighting Man, Washington, 1943.
- George C. BRUNTZ, Propaganda and the Collapse of the German Empire in 1918, Stanford, 1938.
- Philip DAVIDSON, Propaganda and the American Revolution, Chapel Hill, 1941.
- Leonard DOOB, Propaganda, Its Psychology and Technique, New York, 1935.
- Adolf HITLER, Mein Kampf, various editions; Chapter VI, "War Propaganda"
- Harold LASSWELL, Propaganda Technique in the World War, New York, 1938.
- Harold LASSWELL, Ralph D. CASEY, and Bruce Lannes SMITH, Propaganda and Promotional Activities: An Annotated Bibliography, Minneapolis, 1935, and its sequel, Propaganda, Communication, and Public Opinion, A Comprehensive Reference Guide, Princeton, 1946.
- Vladimir Ilyitch LENIN, The Teachings of Karl Marx (various editions).
- Paul M. A. LINEBARGER, Psychological Warfare, A Practical Textbook (in preparation).
- Leo J. MARGOLIN, Paper Bullets, A Brief Story of Psychological Warfare in World War II. New York, 1946.
- Karl MARX and Friedrich ENGELS, The Communist Manifesto (various editions).
- George Fort MILTON, Abraham Lincoln and the Fifth Column, Washington, 1943.
- Edmond TAYLOR, The Strategy of Terror, New York, 1941.
- J. P. WARBURG, Unwritten Treaty, New York, 1946.

Pad set for lettering

Illustration #12. Propaganda money from three wars. The French revolutionary bill of the Year 2 (1793-95) modestly circulates the slogans of the French revolution: upper left, "unity and indivisibility of the Republic"; upper right, "liberty, equality, fraternity or--death". The Russian bill, recalled and no longer valid as money, appeals in many languages for the world revolution (1919). The Japanese puppet 10-peso note from the Philippines has been overprinted by the PWB at General MacArthur's headquarters; enemy money carried American propaganda.

U.S. Army Training Support Centers

HEADQUARTERS, DEPARTMENT OF THE ARMY

INTRODUCTION

This graphic training aid (GTA) is an indispensable reference tool for tactical Psychological Operations (PSYOP) Soldiers assigned to leadership positions. It contains valuable, comprehensive, and timesaving information in a concise format, making it easily transportable and simple to use. The focus of this GTA is to provide requisite information to help the tactical PSYOP Soldier better plan and execute PSYOP in support of a maneuver commander. Noncommissioned officers (NCOs) leading a three-man tactical Psychological Operations team (TPT) or planning PSYOP at division or corps levels will find this GTA extremely helpful.

This GTA includes a number of worthwhile tools and techniques to assist in the planning and conduct of tactical-level PSYOP. From the basic principles of military decision-making process (MDMP) and PSYOP planning through the determination of measures of effectiveness (MOEs), this GTA will help the PSYOP NCO plan and execute doctrinally accurate and successful PSYOP. Numerous formats and guides, such as how to conduct PSYOP estimates, complete operational area assessments, and radio station assessments, are also included.

The proponent of this GTA is the United States Army John F. Kennedy Special Warfare Center and School (USAJFKSWCS). Submit comments and recommended changes to Commander, USAJFKSWCS, ATTN: AOJK-DTD-PO, Fort Bragg, NC 28310-5000.

Unless this publication states otherwise, masculine nouns and pronouns do not refer exclusively to men.

SUPPORTED UNIT INTEGRATION

The PSYOP Soldier's ability to integrate with a supported unit is key in the overall success of the mission. Failure to properly integrate with the supported unit may cause the supported commander to lose trust and respect for PSYOP and its ability to effectively support the mission.

LINKUP COORDINATION WITH A SUPPORTED UNIT

The following are necessary steps in establishing initial linkup coordination:

- Contact the supported commander or designated representative (chief of staff or J-3/G-3/S-3), and brief the supported commander on—
 - PSYOP capabilities (capabilities brief and Appendix B), including the battalion, company, tactical Psychological Operations detachment (TPD), or TPT organization, equipment, personnel, and employment options.
 - Available dissemination means, assets, or products.
 - Constraints and restrictions (approval process or themes and audiences to be used and avoided).
 - PSYOP assets on hand or available through coordination with higher PSYOP units.
 - For whom PSYOP works. Stress that PSYOP units and detachments work in or for the J-3 in joint operations, the G-3 at corps and division and the S-3 at brigade and battalion.
 - With whom the information operations (IO) officer works. Tactical PSYOP are a battlefield operating system (BOS), a form of nonlethal fire support; therefore, PSYOP works in the J-3/G-3/S-3.
- Ensure PSYOP are included in the mission planning.
- Ask for a briefing on the staff's battle rhythm, and the PSYOP and IO integration plan.
- Coordinate for PSYOP to take part in the decision-making process, staff planning for missions, and daily briefings or meetings.
- Ask for a copy of the supported unit's rules of engagement (ROE).
- Determine unit SOP or requirement for daily situation reports (SITREPs).
- Provide a memorandum from the Psychological Operations group (POG) or Psychological Operations battalion (POB) S-2 confirming the security clearances of all PSYOP Soldiers involved in the mission.
- Provide a copy of current PSYOP priority intelligence requirements (PIR).

GTA 33-01-001

- Request access to maneuver unit SITREPs and spot reports (SPOTREPs), enemy prisoner of war (EPW) interrogations, and interrogation reports.
- Ensure PSYOP are coordinated in mission planning with other nonlethal fires.
- Ensure that PSYOP are included in the air-targeting meetings and that targets do not conflict with IO targets.
- Contact the supported unit J-9/G-9/S-9 and—
 - Ascertain if host nation (HN) assets are available for product production and dissemination.
 - Request access to message traffic.
- Contact the supported unit J-6/G-6/S-6 or signal officer, and—
 - Determine the communications systems the supported unit has available, especially Internet, SECRET Internet Protocol Router Network (SIPRNET), and Non-Secure Internet Protocol Router Network (NIPRNET) connectivity.
 - Determine on what radio frequencies the supported unit operates.
 - Coordinate for a PSYOP internal radio frequency.
 - Coordinate for AN/CYZ-10 secure fills.
- Contact the J-1/G-1/S-1, and—
 - Provide a copy of attachment orders and information on the Soldiers to be attached to the supported unit.
 - Provide two copies (one paper copy and one electronic); include (for each attached Soldier) the Soldier's full name, rank, duty position, social security number, security clearance, blood type, next of kin, and next of kin contact information.
 - Determine task organization and which of the supported units the element will be attached to for administrative and logistics support (normally the supported unit's headquarters [HQ] company); provide unit standing operating procedure (SOP) for personnel reporting (for example, daily personnel status [PERSTAT] report).
 - Confirm unit's plan for or availability of mail services and Internet accesses, chaplain or religious services, finance services, and personnel or administrative services.
- Contact the J-4/G-4/S-4, and—
 - Provide information on the number of personnel being attached.
 - Provide the number and types of vehicles and generators.
 - Provide the estimated daily fuel consumption for vehicles and generators.
 - Provide the number and types of weapons systems.

GTA 33-01-001

- Provide battery requirements.
- Learn the unit SOP for requesting supplies and the availability, if any, of PSYOP-specific supplies in the supported unit's supply chain.
- Learn the unit SOP for logistics reporting (for example, daily logistical status report [LOGSTAT]).
- Learn the location of fuel points.
- Learn the location of water points and bath and laundry facilities.
- Learn the availability of sundry and comfort packages.
- Learn the location of supported unit's aid station.
- Learn the location of ammunition supply point (ASP) and ammunition basic load or force protection basic load per weapon.

LIAISON OFFICER GUIDE

LNOs are a vital part to the integration of PSYOP forces into the supported unit's plans and operations. LNOs normally are located in the J-3/G-3/S-3 at all levels of command from the geographic combatant command to the division level. LNOs should—

- Be able to answer the following types of questions:
 - Does the sending unit have a copy of the receiving unit's latest operation plan (OPLAN), operation order (OPORD), and fragmentary order (FRAGO)?
 - Does the receiving unit's plan support the plan of the higher HQ, including logistics and the tactical concept?
 - What are the receiving unit's commander's critical information requirements (CCIR)? At what time, phase, or event are they expected to change? Are there any items the CCIR do not contain that the sending unit can help with?
 - Which sending commander's decisions are critical to executing the receiving unit operation?
 - What are the "not-later-than" times for those decisions?
 - What assets does the unit need to acquire to accomplish its mission? How would they be used? How do they support attaining the more senior commander's intent? Where can the unit obtain them from higher HQ? Other Services?
 - How are aviation assets (rotary- and fixed-wing) being used?
 - How can the LNO communicate with the sending unit? Are telephones, radios, facsimile machines, computers, and other information systems (INFOSYS) available? Where are they located? Which ones are secure?
 - What terrain has been designated as key? Decisive?
 - What weather conditions would have a major impact on the operation?

GTA 33-01-001

- What effect would a chemical environment have on the operation?
- What effect would large numbers of refugees or EPWs have on the receiving unit's operations?
- If your unit is placed under operational control (OPCON) of a larger multinational force, or given OPCON of a smaller such force, what special problems would it present?
- If going to a multinational force HQ, how do the tactical principles and command concepts of that force differ from those of United States (U.S.) forces?
- What HN support is available to the sending unit?
- Understand what the sending commander wants the receiving commander to know. LNOs—
 - Receive a briefing from operations, intelligence, and other staff elements on current and future operations.
 - Receive and understand the tasks from the sending unit staff.
 - Obtain the correct maps, traces, and overlays.
 - Arrange for transport, communications and cryptographic equipment, codes, and signal instructions, including their protection and security.
 - Arrange for replacement of these items, as necessary.
 - Complete route-reconnaissance and time-management plans so the LNO party arrives at the designated location on time.
 - Make sure liaison personnel and interpreters have security clearances and access appropriate for the mission.
 - Verify that the receiving unit received the liaison team's security clearances and will grant access to the level of information the mission requires.
 - Verify courier orders.
 - Know how to destroy classified information in case of an emergency during transit or at the receiving unit.
 - Inform the sending unit of the LNO's departure time, route, and arrival time.
 - Pick up all correspondence designated for the receiving unit.
- Pack the following items:
 - Credentials (including permissive jump orders, if qualified).
 - Forms: Department of the Army (DA) Form 1594 (Daily Staff Journal or Duty Officer's Log) and other blank forms, as required.
 - References.
 - Excerpts of higher and sending HQ's orders and plans.

GTA 33-01-001

- Sending unit SOP.
- The unit modification table of organization and equipment (MTOE), unit status report (if its classification allows).
- Computers and other INFOSYS required for information and data exchange.
- Signal operating instructions extract.
- Security code encryption device.
- Communications equipment, including remote frequency modulated (FM) radio equipment.
- Sending unit telephone book.
- List of commanders and staff officers.
- Telephone calling (credit) card.
- Movement table.
- Administrative equipment.
- Map and chart equipment.
- Tent (camouflage net, cots, stove, and other CTA-50 equipment, as appropriate).
- Foreign phrase book and dictionary.
- Local currency, as required.

COMMAND RELATIONSHIPS

One of the most difficult points to contend with in advising the staff and commander is the command relationship of PSYOP forces. The chart on page 7 should help in determining the relationship of any given element or subelement. PSYOP elements will also have reporting requirements with the PSYOP chain for products and other PSYOP-specific information.

GTA 33-01-001

IF RELATIONSHIP IS:		INHERENT RESPONSIBILITIES ARE:

	General Support (GS)	Parent unit	Parent unit	Parent unit	Parent unit	As required by parent unit	As required by parent unit	Parent unit	Not applicable

NOTE 1. In North Atlantic Treaty Organization (NATO), the gaining unit may not task-organize a multinational unit (see TACON).

NOTE 2. Commanders of units in DS may further assign support relationships between their subordinate units and elements of the supported unit after coordination with the supported commander.

NOTE 3. Coordinating Authority — A commander or individual assigned responsibility for coordinating specific functions or activities involving forces of two or more military departments, two or more joint force components, or two or more forces of the same Service. The commander or individual has the authority to require consultation between the agencies involved, but does not have the authority to compel agreement. In the event that essential agreement cannot be obtained, the matter shall be referred to the appointing authority. Coordinating authority is a consultation relationship, not an authority through which command may be exercised. Coordinating authority is more applicable to planning and similar activities than to operations.

PLANNING

The importance of planning cannot be overstated in relation to the overall success of an operation. Military planning is a continuous process that incorporates supported unit and operational planning. Supported unit planning includes deliberate and crisis-action planning where the end state is the production of an OPLAN or OPORD for a supported unit. The OPLAN or OPORD for a supported unit will include a PSYOP annex or tab, depending on the echelon that the planner is working. Operational planning develops a PSYOP support OPLAN or OPORD that considers all the facets of how PSYOP will achieve its stated objectives. Operational planning continues throughout the operation, incorporates all PSYOP assets, and addresses external requirements. Army planning, regardless of whether it is supported unit or operational, is performed within the framework of the MDMP and the five-paragraph format. MDMP is the standard for Army planning.

MILITARY DECISION-MAKING PROCESS

PSYOP planners are integrated at various levels from combatant command to battalions. Therefore, PSYOP planners need to be familiar with the Joint Operations Planning and Execution System (JOPES) and the Army's MDMP. Although these processes have slightly different methodologies, the essence of what they accomplish is the same. Military planners use both processes to make decisions and ultimately publish OPLANs and OPORDs. The MDMP is shown on page 9.

GTA 33-01-001

THE PSYOP ESTIMATE

The PSYOP estimate is a tool used to conduct PSYOP planning. It is the product of PSYOP IPB and begins during Step II of the MDMP. Its usefulness continues throughout the remainder of the MDMP. The PSYOP estimate is continually updated and may not be submitted as a formal estimate, particularly in crisis-action planning. The MDMP serves as a valuable checklist to remind planners of required information for continued planning. FM 3-05.301, *Psychological Operations Tactics, Techniques, and Procedures*, provides additional information on the PSYOP estimate.

GTA 33-01-001

The estimate should be as detailed as possible, and the PSYOP planner should request assistance in preparing this document from the regional PSYOP battalion and the strategic studies detachment (SSD). The better the estimate, the better the planner will be able to integrate PSYOP into the rest of the supported commander's plan.

The estimate follows a standard five-paragraph format similar to an OPORD. The supported unit's G-2 or S-2 may be able to assist greatly in completing portions of the estimate. The more detail it contains, the better tool it will be.

THE PSYOP PROCESS

The PSYOP process is a systematic and continuous method. The PSYOP process includes the elements of planning, analyzing, synchronizing, developing, designing, producing, distributing, disseminating, managing, and evaluating PSYOP products and actions presented to selected target audiences (TAs). The Psychological Operations task force (POTF) or Psychological Operations support element (PSE) HQ and each detachment or team within the Psychological Operations development center (PDC) or tactical Psychological Operations development detachment (TPDD) has specific tasks and responsibilities to complete throughout this process. They complement each other and are mutually coordinated and supportive.

The missions of the POTF, PSE, PDC, and TPDD during PSYOP development are mutually supportive and require continuous coordination. For example, the G-1 or S-1 produces attachment orders that ensure appropriate manning of the POTF. The POTF or PSE G-2 or S-2 submits intelligence requests (information requirement [IRs] and PIR), monitors intelligence reports, gathers PSYOP-relevant information, and searches all available means to collect impact indicators. The G-2 or S-2 supports the target audience analysis process (TAAP) and assists in the evaluation process. The POTF or PSE G-3 or S-3 coordinates and tracks aspects of production, distribution, and dissemination of products and actions. The G-3 or S-3 coordinates and synchronizes the assets needed to ensure a cohesive PSYOP effort. The G-4 or S-4 obtains the assets needed to produce products. The SSD supports the PSYOP development process by providing expert analysis, and advises the commander and the PDC on TAs and the AO. The PDC and TPDD plan, develop, design, and obtain approval of programs.

The PSYOP process encompasses the seven phases shown on page 13. Certain components of the seven phases are accomplished concurrently. The PSYOP process must be applied in its entirety to all products.

The format of the PSYOP appendix to the IO annex to an OPORD (pages 13 through 15) follows the five-paragraph format. Although it is usually designated Appendix 2, the S-3/G-3 may designate it with another letter. All information in this appendix should be PSYOP-relevant. FM 3-05.301 provides additional information on the PSYOP appendix to the IO annex.

Hostile. Resources and elements available to conduct propaganda.

Friendly. Identify ongoing PSYOP series, tasks, and goals.

Neutral. Identify neutral outlets that may conduct PSYOP; for example, al-Jezecra.

Attachments and Detachments.

PSYOP APPENDIX TO IO ANNEX (CONTINUED)

2. MISSION.

3. EXECUTION.

a. Scheme of PSYOP.

b. Tasks to Subordinate Units.

(1) Tactical Psychological Operations company (TPC) HQ: Responsible for the coordination and execution of distributing all product(s) to the TPDs.

(2) TPDD: Responsible for all contracts for airtime of audio and audiovisual products. Responsible for the development of PSYOP series. Also responsible for deployable audio production system (DAPS) team.

(3) TPD 123: Responsible for the distribution and dissemination of audio, visual, and audiovisual products within their AO. Responsible for series testing within their AO.

(4) TPD 124: Responsible for the distribution and dissemination of audio, visual, and audiovisual products within their AO. Responsible for series testing within their AO.

(5) TPD 125: Responsible for the distribution and dissemination of audio, visual, and audiovisual products within their AO. Responsible for series testing within their AO.

c. Coordinating Instructions.

(1) Presidential and/or Secretary of Defense (SecDef) themes to stress or avoid.

(a) Themes to stress:

(b) Themes to avoid:

(2) POs, SPOs, potential target audiences (PTAs), and MOE are listed in Appendix 1. Tactical PSYOP elements when faced with situations where approved series do not have the level of specificity necessary can create impromptu provisional loudspeaker and face-to-face products concerning only deception, force protection, or civilian noninterference.

(3) Specific timelines for distribution and dissemination of PSYOP products will be given once a series is approved.

(4) Requests for PSYOP support must be submitted through the S-3 or G-3.

PSYOP APPENDIX TO IO ANNEX (CONTINUED)

(5) All aerial delivery of PSYOP products must be coordinated between the PSYOP commander and the division aviation officer.

(6) See Appendix 3 for the SITREP format.

4. SERVICE SUPPORT.

a. Resources. Identify resources required to conduct PSYOP actions. Additional printing and audio materials will be requested through the G-4 and purchased through contracts.

b. Supply Distribution Plan. 2d Infantry Division (ID) supply channels will provide all Army common items. PSYOP-specific equipment will be requested through PSYOP channels to the special operations theater support element (SOTSE).

5. COMMAND AND SIGNAL.

- a. Command.
 - (1) Succession of command.
 - (2) PSYOP approval process is outlined in Appendix 2.

(Classification)

THE PSYOP PLAN

Military planning is extremely complex and must be integrated, synchronized, and coordinated at many different levels. PSYOP planners must be involved in the supported unit's planning, including the seven steps of MDMP. In addition, five PSYOP-specific planning requirements must be completed for PSYOP forces to conduct the PSYOP process. The five requirements are:

- Develop POs.
- Develop SPOs.
- Identify PTAs.
- Determine MOEs.
- Write the PSYOP appendix.

Although the PSYOP plan may have more POs and SPOs, the following graphic on page 16 shows the correct relationship of the elements of all PSYOP plans. FM 3-05.302, *Tactical Psychological Operations Tactics, Techniques, and Procedures*, provides additional information on PSYOP plans.

ORDERS

Receipt of a mission may occur in several ways. It may begin with the initial WARNO or with the TPT leader's receipt of an OPORD. Frequently, leaders receive a mission in a FRAGO over the radio. Ideally, they receive a series of WARNOs, the OPORD, and a briefing from their commander. The ideal sequence of orders flows from WARNO to OPORD to FRAGO.

WARNO: 1) A preliminary notice of an order or action that is to follow.

2) A crisis action planning directive issued by the Chairman of the Joint Chiefs of Staff that initiates the development and evaluation of COAs by a supported commander and requests that a commander's estimate be submitted.

3) A planning directive that describes the situation, allocates forces and resources, establishes command relationships, provides other initial planning guidance, and initiates subordinate unit mission planning.

OPORD: A directive issued by a commander to subordinate commanders for the purpose of effecting the coordinated execution of an operation.

FRAGO: An abbreviated form of an operation order (verbal, written, or digital) usually issued on a day-to-day basis that eliminates the need for restating information contained in a basic OPORD. It may be issued in sections. It is issued after an OPORD to change or modify that order or to execute a branch or sequel to that order.

NOTE: The WARNO format is shown on pages 18 and 19; Quick WARNO Reference, page 19; OPORD, pages 20 and 21; and FRAGO, pages 21 and 22.

Upon receipt of a mission, TPT leaders perform an initial assessment of the situation and allocate the time available for planning and preparation, including rehearsals and movement. This initial assessment and time allocation form the basis of their initial WARNO. Leaders issue the initial WARNO quickly to give subordinates as much time as possible to plan and prepare.

The initial assessment addresses the factors of mission, enemy, terrain and weather, troops and support available, time available, civil considerations (METT-TC). The order and detail in which TPT leaders analyze the factors of METT-TC are flexible, depending on the amount of information available and the relative importance of each factor. For example, TPT leaders may concentrate on the mission, enemy, and terrain, leaving weather and civil considerations until they receive more detailed information.

Often, TPT leaders do not receive their final unit mission until dissemination of the WARNO after COA approval or the OPORD. Effective leaders do not wait until their higher HQ completes planning to begin their planning. Using all information available, TPT leaders develop their unit mission as completely as possible. They focus on the mission, commander's intent, and concept of operations (CONOPS) of their higher and next-higher PSYOP unit. They identify the major tasks their team most likely will be assigned and develop a mission statement based on information they have received. At this stage, the mission may be incomplete.

Based on what they know, Army leaders estimate the time available to plan and prepare for the mission. They begin by identifying the times at which major planning and preparation events, including rehearsals, must be completed. Reverse planning helps in estimating time. TPT leaders identify the critical times specified by higher HQ and work back from them, estimating how much time each event will consume. Critical times might include aircraft loading times, the line of departure (LD) time, or the start point (SP) time for movement. Through reverse planning, leaders arrive at

the time available to plan and prepare for the operation. They limit the amount of time they use to one-third and allocate the remaining two-thirds of time for preparing subordinates.

TROOP-LEADING PROCEDURES

Troop-leading procedures (TLPs) extend the MDMP to small-unit level. Where the MDMP provides a structure for interaction between a commander and staff, TLPs prescribe a sequence of activities for planning and preparing for operations. While the two processes are similar, they are not identical. TLPs and the MDMP are linked by information flow. The type, amount, and timeliness of the information passed from higher to lower HQ directly impact the lower unit leader's TLP. The example on page 23 illustrates the parallel sequences of the MDMP and TLP. However, events do not always occur in the order shown. For example, TLP may start with receipt of an OPORD.

WARNOs may arrive at any time. Team and detachment leaders should remain flexible. They adapt TLPs to fit the situation, rather than try to alter the situation to fit a preconceived idea of how events should flow. Team and detachment leaders should use the TLP guidance shown on pages 23 and 24 when working with TLPs.

TLP GUIDANCE (CONTINUED)

- e. Identify constraints.
- f. Consider METT-TC and observation and fields of fire, avenues of approach, key terrain, obstacles, and cover and concealment (OAKOC).
- g. Develop COAs.
- h. Analyze and compare COAs.
- 4. INITIATE MOVEMENT** (includes recon element, guides, quartering parties, or whole units).
 - a. Move to an assembly area.
 - b. Move to a new AO.
 - c. Move to battle position.
- 5. CONDUCT RECONNAISSANCE.**
 - a. Seek to confirm or deny information that supports tentative plan.
 - b. Conduct first-hand assessment of METT-TC.
 - c. Conduct minimum recon (consists of map recon and imagery).
 - d. Focus on information gaps.
- 6. COMPLETE THE PLAN.**
 - a. Incorporate results of recon into selected COA.
 - b. Prepare overlays.
 - c. Conduct or complete coordinations with adjacent units, higher HQ, and CSS.
- 7. ISSUE THE ORDER.**
 - a. May be verbal or written.
 - b. Use five-paragraph format.
 - c. Use terrain model, maps, and detailed sketches.
- 8. SUPERVISE AND REFINE.**
 - a. Throughout TLP, monitor mission preparation and refine the plan.
 - b. Conduct initial and final inspections of personnel and equipment.
 - c. Conduct rehearsals.
 - d. Conduct confirmation brief.
 - e. Conduct briefback.
 - f. Conduct combined arms rehearsal.
 - g. Conduct support rehearsal.
 - h. Conduct battle drill or SOP rehearsal.

CAPABILITIES BRIEF

The capabilities (CAPES) brief usually sets the tone for the effectiveness of tactical PSYOP with the supported unit. The brief can be a full PowerPoint slide presentation, a desk-side briefing, or simply an oral presentation. No

GTA 33-01-001

matter the briefing type, the briefing must be planned, rehearsed, and tailored to the supported commander. FM 3-05.302 provides additional information on the CAPES brief.

The briefer should advise the commander that he is his PSYOP subject-matter expert and staff planner. To perform as such, he works directly for the commander and the S-3. This relationship requires direct access to the commander and participation throughout the MDMP. The briefer should explain his dual chain of command—he has a coordinating chain for PSYOP-specific support, such as product requests and approval, yet falls under the supported commander's chain of command.

The briefer should advise the commander on the types of products he physically has with him, the types to which he has access, and the product request process. The goal of the briefer should be to let the commander know what he currently has and how he can get more or new products.

All capabilities briefs should be formatted in the same manner whether a TPT-level or a TPC-level briefing. The format should contain the following:

- Introduction.
- How the TPT will support the commander, including—
 - PSYOP plan.
 - Three key PSYOP points.
- Product support and approval chain.
- Equipment.
- Support required.
- Closing.

The most important aspect of the capabilities brief is the presentation of the appropriate information. The briefer must prepare and deliver a professional brief (content, appearance, and delivery). A professional brief will ensure that PSYOP capabilities will be fully nested in the supported unit's concept of operations.

PSYOP capabilities and the supported unit's mission will determine the format and content of the capabilities brief. However, the PSYOP mission statement is critical because it links the SPOs with the supported unit's objectives. The brief may contain the following information; however, the actual content of the brief will be tailored to the specific supported commander:

- PSYOP mission statement (for example: On order TPT/TPD/TPC XXX will support the unit's mission by providing tactical PSYOP support to SPO A and SPO B).

GTA 33-01-001

- Command relationships.
- Person PSYOP are working for in the supported unit.
- PSYOP coordination chain.
- Propaganda assessment.
- Ongoing PSYOP programs and their effects in the supported unit's AOI.
- Additional organic capabilities.
- Higher PSYOP capabilities.
- Limitations on PSYOP and higher capabilities.
- Approval process and authority.
- Preapproved series that PSYOP are resourced to execute.
- Preapproved series that PSYOP are not resourced to execute.
- PSYOP MOEs.
- Series development timeline.
- Unresolved issues that require the supported commander's attention.

PSYOP TOOLS

PSYOP leaders use a variety of tools and techniques in planning and conducting tactical-level PSYOP. The tools and techniques are discussed and depicted on pages 26 through 31.

PSYOP MAPPING SYMBOLS

PSYOP leaders use PSYOP mapping symbols to annotate the location of PSYOP activities such as the location of a PSYOP TA. The graphic on page 27 shows PSYOP mapping symbols and their descriptions.

PSYOP MAPPING SYMBOLS		
Symbol Title	Description	Symbol
Propaganda	The location of propaganda.	
PSYOP Written	The location for hand dissemination of PSYOP leaflets, handbills, flyers, and posters.	
PSYOP Leaflets, Helicopter (Rotary-Wing)	The location for the helicopter dissemination center of impact area of PSYOP leaflets.	
PSYOP Leaflets, Aerial (Fixed-Wing)	The area for the airborne dissemination center of impact area of PSYOP leaflets. Military or commercial fixed-wing aircraft may make delivery.	
PSYOP TA Location	The location of a PSYOP TA.	
PSYOP Loudspeaker Broadcast, Wheeled-Vehicle Mounted	The location of a ground-based mounted PSYOP loudspeaker broadcast event or loudspeaker team.	
PSYOP Loudspeaker Broadcast, Helicopter (Rotary-Wing) Mounted	The location of a helicopter- (rotary-wing) mounted loudspeaker, PSYOP broadcast mission or event, or a helicopter loudspeaker system or unit.	
PSYOP Broadcast, Aerial (Fixed-Wing) Station	The location of an aerial broadcast transmitted over radio or television (TV) frequencies, or a location of an aerial broadcast PSYOP system or unit.	
PSYOP Radio Broadcast	The location of a civilian- or military-operated radio broadcast tower or station used to broadcast PSYOP messages.	
PSYOP TV Broadcast	The location of a civilian- or military-operated TV broadcast tower or station used to broadcast PSYOP messages.	
PSYOP Face-to-Face	The location of direct face-to-face of tactical PSYOP, used in establishing legitimacy and credibility of messages with foreign populations.	
PSYOP Printing Service	The location of a civilian- or military-operated print facility used to print PSYOP messages.	
PSYOP Distribution Center	The location of a civilian- or military-operated distribution facility or area used as a holding or distribution point for PSYOP messages.	
PSYOP Unmanned Aerial Vehicle	The location of PSYOP unmanned aerial vehicle (wind supported aerial delivery system [WSADS]).	

INTERPRETERS

PSYOP Soldiers may require an interpreter to effectively communicate with the local populace. Guidance on how to select an interpreter, what to do and not do when using an interpreter, and how to work with the interpreter is provided on pages 28 through 31.

GUIDANCE FOR USE OF INTERPRETER**Interpreter Selection:**

- An interpreter should be a native speaker of the socially or geographically determined dialect.
- An interpreter's speech, background, and mannerisms should be completely acceptable to the TA so that no attention is given to the way he talks, only to what he says.
- An interpreter may be limited in his effectiveness with a TA if his social standing is considerably lower than that of the audience. Examples include significant differences in military rank or membership in an ethnic or religious group.
- Interpreting goes both ways. The interpreter must be able to convey the information expressed by the interviewee or TA.
- An interpreter should be quick, alert, and responsive to changing conditions and situations.
- An interpreter must be able to grasp complex concepts and discuss them without confusion in a reasonably logical sequence.
- Generally speaking, the better educated the interpreter, the better he will perform because of increased exposure to diverse concepts.
- You may need an interpreter with technical training or experience in special subject areas. This type of interpreter will be able to translate the "meaning" and the "words." For instance, if the subject is very technical or specialized, with terms such as "nuclear physics," background knowledge is useful.
- Beware of the potential interpreter who arrives late for the interview. Make sure the interpreter understands the military's preoccupation with punctuality.
- If the interpreter is a local national, his first loyalty is most likely to the local populace or subgroup, not to the U.S. military.
- Interpreters, for political or personal reasons, may have ulterior motives or a hidden agenda when they apply for the interpreting job.

GUIDANCE FOR USE OF INTERPRETER (CONTINUED)

If you detect or suspect such motives, you should tell the commander or security manager.

- Gender, age, and race have the potential to affect the mission seriously. An interpreter from outside the TA's group may have limited effectiveness, since traditions, values, and biases vary from country to country.
- Interpreters must be honest and free from unfavorable notoriety among the local inhabitants.
- Orient the interpreters as to the nature of their duties, expected standards of conduct, techniques of interview to be used, and any other requirements necessary. The orientation may include the following:
 - Current tactical situation.
 - Background information obtained on the source, interviewee, or TA.
 - Specific objectives for the interview, meeting, or interrogation.
 - Method of interpretation to be used—simultaneous or alternate.
 - Conduct of the interview, lesson, or interrogation.
 - Need for interpreters to avoid injecting their own personality, ideas, or questions into the interview.
 - Instruction to the interpreters to mirror the Soldier's tone and personality of speech.
 - Instruction to the interpreters to inform you if they notice any inconsistencies or peculiarities from sources.
 - Possible need for interpreter to assist in after-action reports (AARs) or assessments.

Interpreter Session:

- You and the interpreter must work as a team. The TA is quick to recognize personality conflicts between the Soldier and the interpreter, which can undermine the effectiveness of the communication effort.
- About 4 hours of active interpreting is the maximum for peak efficiency.
- Be cautious about what information you give the interpreter. Certain tactical situations may require the use of uncleared indigenous personnel as "field-expedient" interpreters. Commanders should be

GUIDANCE FOR USE OF INTERPRETER (CONTINUED)

aware of the increased security risk involved in using such personnel and carefully weigh the risk versus the potential gain. If uncleared interpreters are used, any sensitive information should be kept to a minimum.

- Be aware that some interpreters, because of cultural differences, may try to “save face” by purposely concealing their lack of understanding. They may try to translate what they think you said or meant without asking for a clarification or vice versa.

Dos and Don'ts

- Present one major thought in its entirety, and allow the interpreter to reconstruct it in his language and culture.
- Insist that the interpreter always asks for clarification before interpreting whenever he is not certain of the meaning.
- Ensure the interpreter understands that if questions are asked, he should immediately relay them to the PSYOP Soldier for an answer.
- Ensure the interpreter understands he should never try to answer a question, even though he may know the correct answer.
- Consider the use of profanity, slang, and colloquialisms. In many cases, such expressions cannot be translated.
- If a technical term or expression must be used, ensure the interpreter conveys the proper meaning in the target language.
- Never say more in one sentence than the interpreter can easily repeat word for word immediately after hearing it.
- Each sentence should contain a complete thought without verbiage.
- Keep the entire presentation as simple as possible, using short sentences and simple words (low context).
- Avoid idiomatic English.
- Avoid tendency toward flowery language.
- Avoid slang and colloquial expressions.
- Identify any cultural restrictions before interviewing, instructing, or conferring with an interpreter.
- Position the interpreter by your side (or even a step back). This method keeps the subject or audience from shifting attention or from fixating on the interpreter and not on the PSYOP Soldier.
- Always look at and talk directly to the subject or audience. Guard against the tendency to talk to the interpreter.

GUIDANCE FOR USE OF INTERPRETER (CONTINUED)

- Speak slowly and clearly. Repeat as often as necessary.
- Periodically check the interpreter's accuracy, consistency, and clarity.
- Check with the audience whenever misunderstandings are suspected, and clarify immediately. Using the interpreter, ask questions to elicit answers that indicate the point is clear.
- Make the interpreter feel like a valuable member of the team. Give the interpreter recognition commensurate with the importance of his contribution.
- Do not address the subject or audience in the third person through the interpreter.
- Do not make side comments to the interpreter that he should not translate. This action usually creates the wrong atmosphere for communication.
- Do not be a distraction while the interpreter is translating and the subject or audience is listening.

RAPID LOCAL ASSESSMENT

For planning purposes, PSYOP leaders may require information quickly about the local area. The Rapid Local Assessment shown on pages 31 through 34 will aid them in acquiring this information. FM 3-05.302 provides additional information on Rapid Local Assessment.

Summary and additional remarks:

MEDIA ASSESSMENT GUIDE

The information from the media assessment is crucial in supporting the interaction of PSYOP Soldiers with local media assets, such as newspapers and radio and TV stations. The list of questions is not all-inclusive. Some of these questions may not be relevant to all media assets or cannot be initially answered. When visiting a newspaper office or a TV or radio station, forces must not make promises that cannot be supported. Unfulfilled promises can quickly destroy any relationship with the facility and its manager. An example of a Media Assessment Guide is shown on pages 46 through 50. FM 3-05.302 provides additional information on the Media Assessment Guide.

MEDIA ASSESSMENT GUIDE**1. RADIO/TELEVISION STATIONS**

- a. What is the location of the radio station?
Town name: _____
Street name: _____
Neighborhood: _____
Universal transverse mercator [UTM] coordinates: _____
Geographic coordinates: _____
Proximity to landmarks: _____
- b. Who is the manager?
Owner, or POC: _____
Professional background: _____
Languages spoken: _____
Ethnic group: _____
Tribal affiliations: _____
Family background: _____
Religion: _____
Political agenda: _____
- c. How can we contact the station manager or POC?
Telephone number: _____
E-mail: _____
Residence: _____
- d. Who else can act as a facilitator in doing business with this radio station?
Village headman, political party official, and so on: _____

MEDIA ASSESSMENT GUIDE (CONTINUED)

- e. What other media facilities are collocated with this radio station?
(For example, a TV station or audio recording studio in the same or adjacent building.) _____

- f. What are program times and formats?
(For example, music, 0600-1000; news, 1000-1200; music, 1200-1600; talk radio, 1600-2200.) _____

- g. What are the demographics for the station's audience?
(Ethnicity, ages, socioeconomic standing, and so on.) _____

- h. What are the station's sources of broadcast material?
(Internet downloads, satellite network rebroadcasts, commercially purchased programs or CDs, black market materials, recordings of local artists, live performers, gifts from NGOs, and so on.) _____

- i. What are the station's sources of news broadcast material?
Commercial news services: _____
Local newspapers: _____
Reporters: _____
Internet: _____
Local journalists: _____
- j. What advertisers are currently doing business with the station?
Political parties: _____
Local businesses: _____
NGOs and so on: _____
- k. How does the station charge advertisers? (Barter for free airtime? Price per minute? What national currencies does the radio station accept? What form of payments does the station accept?) _____

MEDIA ASSESSMENT GUIDE (CONTINUED)

- l. What broadcast equipment does the station use? Format? (CD, DVD, MP3, Betamax, PAL, or NTSC? Manufacturer and model number? Recommend taking a digital photograph of the radio station's broadcast equipment. We want to provide compatible media for broadcast and maybe replacement parts or upgrades; a photograph will facilitate this.) _____

- m. What electrical power source does the station use? (Commercial power or generator. What type of electrical outlets is used in the radio station—American or European, 110V or 220V?) _____

- n. What are the parameters of the station's electrical power supply? Voltage: _____ Hertz [Hz]: _____
- o. What is the reliability of the station's electrical power supply? (How often do blackouts, brownouts, and surges occur?) _____

- p. Where is the station's antenna located? (Is the antenna collocated with the broadcast studio or is it in a remote location? UTM: _____ Geo coordinates: _____
- q. What type of antenna does the station use? (Dipole, single pole, and so on.) _____
- r. What type of soil is prevalent at the antenna site? (Sand, loam, clay, and gravel.) _____
- s. What is the station's broadcast output? (In watts) _____
- t. What is the radio station manager's estimate of the broadcast footprint? _____
- u. What is the total estimated audience size, and what are the peak audience hours and days? _____
- v. What nearby terrain features affect the station's broadcast footprint? (Mountains, steep valleys, large buildings.) _____

MEDIA ASSESSMENT GUIDE (CONTINUED)

- w. What is the operating frequency or channel designation for the station? _____

2. NEWSPAPER/PRINT

- a. What is the location of the newspaper/print office?

Town name: _____

Street name: _____

Neighborhood: _____

UTM coordinates: _____

Geo coordinates: _____

Proximity to landmarks: _____

- b. Who is the manager? _____

Owner or POC: _____

Professional background: _____

Languages spoken: _____

Ethnic group: _____

Tribal affiliations: _____

Family background: _____

Religion: _____

Political agenda: _____

- c. How can we contact the editor/manager or POC?

Telephone number: _____ E-mail: _____

Residence: _____

- d. Who else can act as a facilitator in doing business with this organization? (Village headman, political party official, and so on.) _____

- e. What is the overall format and tone of the print source? (Local/town newspaper, national, international, entertainment, general interest, black and white, full color, and so on.) _____

- f. What is the orientation of the newspaper/print source? (Pro-U.S. anti-U.S., or central government and so on.) _____

MEDIA ASSESSMENT GUIDE (CONTINUED)

- g. What are the station's sources of news material?
 Commercial news services: _____
 Staff reporters: _____
 Internet: _____
 Local journalists: _____
- h. What advertisers are currently doing business with the newspaper/print source?
 Political parties: _____
 Local businesses: _____
 NGOs: _____
 Others: _____
- i. How does the newspaper/print source charge advertisers? (Barter for free ad space? Price per minute? What national currencies do they accept? What form of payment do they accept?) _____

- j. What editing equipment does the newspaper/print source use? (PC or Macintosh, hardcopy typesetting, and so on. We want to provide compatible media, so ensure we find out what format is needed.) _____

- k. What is the publishing frequency? (Daily, 5 days/week, weekly, monthly, and so on.) _____
- l. What is the approximate readership? (Readers per issue or per week.) _____

- m. What are the demographics of their readership? (Ethnicity, socioeconomic standing, and so on.) _____

- n. What are the most heavily read publishing days (if applicable)? _____

MESSAGE TRAFFIC AND SITREPs

Managing message traffic is an essential task for LNOs and PSYOP staff officers and NCOs. A standard message-numbering format is necessary to ensure a smooth flow of information between elements. Information shown below goes in the upper left corner of all messages distributed.

STANDARD MESSAGE FORMAT					
(1) Priority and Distribution: Received by:			From: Message Identification:		
(2) Message Identification Format:					
In or Out	Date	Hour	Time	Month	
Year					
I	17	0714	Z	Jun	02
Example: (Incoming message) I170714ZJun 02					

SITREPs are a daily (or more) task for an LNO. A sample format is shown on pages 51 through 55.

STANDARD SITREP FORMAT	
1. SITUATIONAL REPORTS (SITREPs).	
a. How to send and format.	
b. SITREP archives.	
c. Current situation.	
1) Friendly.	
2) Enemy.	
a) Propaganda.	
b) Source, content, audience, media, and effects (SCAME).	
3) TA.	
a) Key communicators.	
b) Religious leaders.	
c) TA language and literacy percentage.	
d) Conditions.	
e) Vulnerabilities.	
f) Current lines of persuasion.	
g) Susceptibility.	
h) Accessibility.	
i) Effectiveness.	
j) PO, SPO, and MOE.	
4) Neutral.	
5) ROE.	

STANDARD SITREP FORMAT (CONTINUED)

- 6) Rules of interactions (ROI).
- d. Lessons learned.
 - 1) AAR.
 - 2) See also (SITREPs).
- 2. BATTLE RHYTHM.**
 - a. Update briefs.
 - 1) Decision briefs.
 - 2) Staff briefs.
 - 3) Staff estimates.
 - b. Chain of command.
 - 1) Commanding officer (CO), executive officer (XO), S-1, S-2, S-3, and so on.
 - c. Planning tools.
 - 1) Briefings.
 - 2) Model outlines.
 - 3) Maps.
 - 4) PSYOP-specific (SEM and SDW).
 - 5) Current OPORD, Annex, and Tab.
 - 6) Field manual (FM).
- 3. SUPPORT CHANNELS.**
 - a. Product development detachment.
 - 1) Website.
 - 2) Capabilities.
 - 3) Product turnaround time.
 - 4) Quality.
 - 5) Product books.
 - 6) Current project status.
 - 7) Read on yes or no.
 - 8) Location.
 - 9) Novelty items.
 - 10) Numbering and tracking.
 - 11) Chain of command.
 - b. Special Operations Media System-B (SOMS-B).
 - 1) Capabilities, recording, and reproduction.
 - 2) Product turnaround time.
 - 3) Interpreter.

STANDARD SITREP FORMAT (CONTINUED)

- 4) Footprint.
- 5) Programs.
- 6) Frequency.
- 7) Issues.
- 8) Current and proposed projects.
- c. Reachback to TPD.
 - 1) SIPRNET address.
 - 2) Army Knowledge Online (AKO) address.
 - 3) IP address.
 - 4) Red phone.
- d. Reachback to company.
 - 1) Secure phone.
 - 2) SIPRNET address.
 - 3) AKO address.
 - 4) Rear detachment battalion S-3.
- e. Supported unit's assets.
 - 1) Supply.
 - 2) Quarters.
 - 3) Security.
 - 4) Airflow.
 - 5) Motorpool.
 - 6) Civil-military.
 - 7) Logistics transport means and schedule.
- f. Interpreter.
 - 1) Strength.
 - 2) Weakness.
 - 3) Language.
 - 4) Clearance.
 - 5) Location.
 - 6) Writing ability.
 - 7) Vocabulary.
 - 8) Supervisor.
 - 9) Ethnicity.
 - 10) Overall assessment.
 - 11) Equipment needs and issue.
 - 12) Personnel issues.

STANDARD SITREP FORMAT (CONTINUED)

- g. Additional support.
 - 1) Operational detachment A.
 - 2) Other government agency (OGA).
 - 3) Civil Affairs (CA).

4. AREA OF OPERATIONS.

- a. PSYOP assessment.
 - 1) Country.
 - 2) Province.
 - 3) Village.
 - 4) Tribes.
- b. CA assessments.
- c. Availability of contracted assets.

5. ASSIGNMENT OF EQUIPMENT.

- a. DA Form 2062 (Hand Receipt/AnnexNumber).
- b. Deployment report.
- c. Weapons.
- d. Vehicles.
- e. Radios.
- f. Loudspeakers.
- g. Minidisk player and recorder.
- h. Media kit.
- i. Supplies (medical, office, and NBC).
- j. Keys, locks, and combinations (CONEX, safe, and tactical operations center [TOC]).
- k. Batteries for radios, minidisc player, and cameras.
- l. Maps.
- m. GPS.
- n. Computers.
- o. Hard drives (SECRET and UNCLASSIFIED).
- p. Storage units (CONEX, ISU-90, and safe).

6. PRODUCTS.

- a. PSYOP series.
 - 1) PO and SPO.
 - 2) MOE.
 - 3) SDW.
 - 4) TA.

STANDARD SITREP FORMAT (CONTINUED)

- 5) SCW and SEM.
- b. Products.
 - 1) Pretest.
 - 2) Posttest.
- c. Evaluation.
 - 1) Impact indicators.
 - 2) Spontaneous events.
 - 3) Testing results.
 - 4) New series.
 - a) TA.
 - b) PO and SPO.
- d. Product book and product CD.
- e. Product approval process.
- f. Product inventory.
- g. Distribution process.
- 7. COMMUNICATIONS.**
 - a. Comm procedures.
 - b. Comm chief and location.
 - c. Signal operating instructions (SOI).
 - 1) Call signs.
 - 2) Frequencies.
 - 3) Current challenge and password.
 - 4) Next frequency changeover.
 - d. Type of reachback to use:
 - 1) MBITR.
 - 2) SIPRNET.
 - 3) Advanced System Improvement Program (ASIP).
 - 4) NIPRNET.
 - 5) Fox.
 - 6) Giant.
 - 7) 150.
 - 8) STU.
 - 9) IRIDIUM access code.
 - e. Comm fill.
 - f. Address to PSYOP SITREP archives.
 - g. PSYOP web addresses.
 - h. Passwords for laptops and IRIDIUM.

PROPAGANDA ANALYSIS

PSYOP leaders can use propaganda to sway the opinion of the local populace. The Propaganda Analysis, shown on pages 56 and 57, is a tool for PSYOP leaders to use in determining the effects of propaganda.

PROPAGANDA ANALYSIS

Source Analysis: What is the real source?

DTG: When last updated?

1. Elements of the source:

- a. Actor.
- b. Authority.
- c. Author.

2. Type:

White _____ Gray _____ Black _____

3. Credibility of each source element:

- a. Actor.
- b. Authority.
- c. Author.

Content Analysis: What does the propaganda say? What is it trying to get the TA to do?

1. Objective of the message.
2. Line of persuasion used.
3. Morale of the source.
4. Involuntary information in the message (news, opinions, and entertainment).
5. Biographical information (new leader and so on).
6. Economic information.
7. Propaganda inconsistencies.
8. Intentions or agenda of the source.
9. Geographic information.

Audience Analysis: Who are the audiences?

1. Apparent audience:
 - a. Perception of the message.
 - b. Reason selected.
2. Ultimate audience:
 - a. Perception of the message.
 - b. Reason selected.

PROPAGANDA ANALYSIS (CONTINUED)

- 3. Intermediate audience:
 - a. Perception of the message.
 - b. Reasons selected.
- 4. Unintended audience:
 - a. Perception of the message.
 - b. Reason selected.

Media Analysis: What media are used and why?

- 1. Type:
 - a. Radio.
 - b. Television.
 - c. Print (specific type).
 - d. Newspaper/magazine.
 - e. Internet.
 - f. Other.
- 2. Frequency.
- 3. Placement.
- 4. Place of origin.
- 5. Technical characteristics.
- 6. Method of dissemination.
- 7. Transmission mode.

Effects Analysis: What impact is this propaganda having?

- 1. Methods used in analysis.
- 2. Impact indicators.
- 3. Conclusions.

TOOLS TO SUPPORT TACTICAL OPERATIONS

PSYOP planners have tools that they use to support tactical operations. These tools include the following:

AFTER ACTION REVIEWS

AARs can be formal or informal and internal or external. Leaders should, time permitting, do internal AARs with their teams and detachments. Since PSYOP units are attached to combat units, PSYOP team leaders will inevitably have to take part in the AAR(s) of the supported unit. The sequence on page 58 is reproduced from GTA 25-06-023, *After Action Review (AAR) Pocket Reference Guide*. Leaders who will be taking part in several AARs may wish to obtain GTAs 25-06-023 and 08-01-002, *Leader's Guide to After-Action Debriefing*.

AFTER ACTION REVIEW SEQUENCE

1. State training or mission objectives.
2. Have the unit leader restate his mission and present his plan.
3. Review actions before detection or contact.
4. Review first detection or contact.
5. Review report of first detection or contact.
6. Review reaction to first detection or contact.
7. Review FRAGO, if used.
8. Review events during engagement.
9. Review subsequent events.
10. Review extent to which unit met training objectives. (Training, practice required, and untrained performance.)
11. Have participants summarize the major learning points. (Basic for training objectives in next exercise.)
12. Describe clear and concise training objectives for the next exercise. (Objectives must be measurable or observable.)

CIVIL DISTURBANCE GUIDELINES

PSYOP leaders may be faced with a civil disturbance. Guidelines for handling a civil disturbance are shown on pages 58 through 60.

CIVIL DISTURBANCE GUIDELINES

1. Conduct link-up with the supported commander, as needed.
 - a. Receive mission, and confirms ROE.
 - b. Receive update on current situation.
 - c. Assess situation on ground.
 - d. Establish liaison with other quick-reaction force (QRF) and graduated response measure (GRM) components, as required.
2. Maintain communications with higher HQ, and submit SITREPs, as required. The team leader conducts a mission analysis.
 - a. Identify facts and assumptions (about the TA). Use the following questions as a guide:
 - 1) Identify key communicator or lead agitator. What is his or her message?
 - 2) What is the general attitude or behavior of the group(s)?
 - 3) How many people are present in the group(s)?
 - 4) What are the demographics (age and gender)?
 - 5) What is the cultural composition of the group(s)?
 - 6) How are they moving (mounted or dismounted)?
 - 7) Are signs or banners present and, if so, what is the message?

CIVIL DISTURBANCE GUIDELINES (CONTINUED)

- 8) Are media on site? If so, identify who they represent.
- 9) Are there weapons present?
- 10) Who else is present at the location (police, elected public officials, NGOs, CA, or other forces)?
- 11) Is the group(s) from that location or have they come from abroad? If from abroad, where and why?
- 12) How did the people know or hear about the gathering, rally, or demonstration?
- 13) What are the underlying grievances or stated objectives for the event?
- 14) What are the locations of food storage?
- 15) Is there any Government representation in the area? (Who, what, where, local, national, and so on.)
- 16) Have there been any reports of war crimes?
- 17) Has there been any use of propaganda?
- 18) How are people usually addressed?
- 19) Historically, do civilians tend to stay in their homes during conflict or do they tend to flee?
 - b. Specified and implied tasks (see commander's intent, scheme of maneuver, and coordinating instructions).
 - c. Constraints and limitations (to include resources available to address needs and grievances of the crowd and ROE).
3. Be prepared to create a message for broadcast, if needed.
4. Monitor message content (face-to-face or loudspeaker):
 - a. Give simple directions and clear and concise instructions, and maintain your composure.
 - b. Avoid using the word "please" to avoid a passive appearance.
 - c. Do not issue ultimatums that are not approved by the commander. Give crowds time to conform to ultimatums.
 - d. Continually monitor impromptu messages.
 - e. Use approved IO themes, when available.
 - f. Translate message into TA language, and pretest, if possible.
5. Isolate and conduct face-to-face communication with key communicator(s). Document actions with still or video images.
6. Conduct loudspeaker operations, if necessary:
 - a. Use only when necessary to address a large crowd or if communications break down.

CIVIL DISTURBANCE GUIDELINES (CONTINUED)

- b. Direct broadcast toward agitators.
 - c. Write scripts, and then read them verbatim. Conduct impromptu broadcasting only if necessary.
 - d. Use interpreter, if available. Conduct rehearsals with this interpreter before going “live.” Ensure gender and other social aspects of interpreter are credible in the eyes of the TA.
 - e. Select a broadcast position to address the crowd effectively and not compromise the security of the team.
 - f. Maintain communications with commander or his representative.
 - g. Limit volume so as not to appear too overbearing. Do not “harass” unless necessary.
7. The team leader ensures that PSYOP-relevant information, human intelligence (HUMINT), and PIR are forwarded through appropriate channels.
- a. If a counterintelligence (CI) team is on the mission, conduct a debrief with that team.
 - b. If no CI team is on the mission, debrief with the supported unit S-2.
 - c. Forward any relevant PSYOP information back up through normal PSYOP channels.

PREPARATIONS FOR MOVEMENT

The graphics on page 61 provide quick guides to determining necessary fuel and water stores for any movement. These graphics provide good estimates, but specific mission parameters may rotate figures upward. For instance, frequent loiters or security halts may increase fuel consumption. Water consumption will go up during dismounted operations or mounted operations in extreme heat. The recommended water consumption level in extreme situations (the necessity of still conducting operations during Heat Category 5) is 1 quart per hour.

GTA 33-01-001

FUEL ESTIMATION

	_____	total miles of mission (mission distance)
divide by	_____	vehicle mpg average
		light load highway = 12 mpg
		heavy load highway = 10 mpg
		light load cross-country = 10 mpg
		heavy load cross-country = 7 mpg
		fully loaded trailer = subtract 5 mpg
equals	_____	gallons necessary per vehicle
plus	_____	% of gallons necessary
		1:250,000 = 15%
		added for map error 1:100,000 = 10%
		1:50,000 = 5%
equals	_____	adjusted gallons necessary per vehicle
multiply by	_____	number of vehicles on mission
equals	_____	gallons necessary for detachment
plus	_____	15% safety factor
equals	_____	total detachment fuel requirements
minus	_____	gallons carried in vehicle fuel tanks
		(25 gallons per vehicle tank)
equals	_____	gallons of fuel to be carried in 5-gallon fuel cans
divide by	_____	gallons per can (U.S. fuel can = 5 gallons)
equals	_____	5-gallon cans necessary for remaining fuel requirements

WATER ESTIMATION FORMULA

	_____	number of personnel
multiply by	_____	number of quarts per day (minimum 4 to 6 quarts)
multiply by	_____	number of days of mission duration
equals	_____	mission water requirements
plus	_____	15% safety factor
equals	_____	total% safety factor
divide by	_____	gallons per can (U.S. water can = 5 gallons)

VEHICLE AND CONVOY OPERATIONS

The graphics on pages 62 through 66 aid PSYOP planners in preparing for movements.

VEHICLE AND CONVOY OPERATIONS PLANNING

1. General threats:

- a. Vehicle-born improvised explosive devices (IEDs).
- b. Suicide bombers.
- c. Rocket-propelled grenades.
- d. Sniper fire.
- e. Direct-fire ambushes.
- f. Grenade attacks.
- g. Motor attacks.
- h. Hostile crowds.
- i. Terrorist or hostile surveillance.

2. Potential specific threats:

- a. Entrances to alleys.
- b. Rooftops or balconies.
- c. Overpasses.
- d. Vans with sliding doors.
- e. Motorcycles.

3. Characteristics:

- a. Aggressiveness.
 - 1) Use aggressive driving skills.
 - 2) "Porcupine" muzzles in an outward posture.
 - 3) Demonstrate a positive readiness and willingness to engage threats.
 - 4) Potentially use vehicle as weapon.
 - 5) Dominate your environment.
- b. Situation awareness:
 - 1) 360-degree security.
 - 2) Recon.
 - 3) Knowledge of route.
 - 4) Collective mission knowledge.
 - 5) Well-rehearsed internal communications.
 - 6) Communications to higher HQ.
 - 7) Scanning in 3-dimension (depth, width, and elevation).
 - 8) Watching people, their hands, and behavior.

VEHICLE AND CONVOY OPERATIONS PLANNING (CONTINUED)

- c. Unpredictability:
 - 1) Vary routes, departure times, and vehicle intervals and speeds.
 - 2) Think like the enemy. (How would I attack me?)
 - 3) Convoys should not be easily timed, observed, or approached.
 - 4) Do not appear lost.
- d. Agility:
 - 1) Drive as fast as appropriate.
 - 2) Maneuver through or around motorist, pedestrians, and so on.
 - 3) Compress or expand intervals.
 - 4) Be prepared to rapidly change course.
- e. Protection:
 - 1) Stay alert, and make yourself a hard target.
 - 2) Be prepared for an IED attack followed by an ambush.
 - 3) Maintain maximum safe speeds.
 - 4) Maintain vehicle dispersion.
 - 5) Be extra cautious at choke points, broken-down vehicles, bridges, one-way streets, and sharp turns.
 - 6) If something causes the convoy to stop, watch the flanks and dismount vehicle.
 - 7) Rehearse actions on contact.
 - 8) Get out of "kill zone" fast.
 - 9) Do not approach IED. IEDs are often command-detonated.
 - 10) Keep up to date with recent threats and enemy tactics.
 - 11) Rehearse dismounted and mounted shooting drills.
 - 12) Place tire on brush guard in the absence of bumper for pushing objects or ramming.
 - 13) Ensure load-out vehicles are nearly identical.
 - 14) Ballistic blankets should be used with 1/4-inch steel plate and strapped and secured to areas needing extra protection.
 - 15) Sandbags should be used with discretion considering weight and secondary missile effect.
 - 16) Remove doors from light-skinned vehicles (situation-dependent).
- f. Possible ambush indicators:
 - 1) Absence of women and children when normally present.
 - 2) Dramatic changes in population from one block to the next.

VEHICLE AND CONVOY OPERATIONS PLANNING (CONTINUED)

3) Signals with flares and/or lights (turned off or on) as convoy approaches.

4) Vehicle following convoy for long period of time and then pulling off the side of the road.

5) Broken-down vehicles along roadway.

6) Dead animals along roadway.

7) Freshly dug hole along roadway.

8) Obstacles in roadway used to channel convoy.

9) Personnel on overpass.

10) Personnel in traffic circle.

4. Communication:

a. Ensure everyone knows how to zero all radios.

b. Use intrasquad and intervehicle radios.

c. During missions, have a computer with imagery or Falcon View in the primary navigation vehicle for contingency situations and positive target identification.

d. AN/PRC-150 for command and control (C2) vehicle.

e. External speaker.

f. Use an AN/PRC-148 (MBITR) for ground and air communications.

g. Use an intersquad radio system.

h. Have cryptography equipment for all radios.

i. Use Blue Force Trackers IAW unit SOP.

j. Use primary, alternate, contingency, and emergency (PACE).

5. Battle drills:

a. Ramming techniques.

b. Down driver.

c. Vehicle recovery.

d. React to contact, near ambush.

e. React to contact, far ambush.

f. React to sniper fire.

g. React to suspected ground IED.

h. React to IED detonation.

i. React to roadblock.

j. React to vehicle-born improvised explosive device (VBIED).

k. React to large crowd.

l. Consolidation and reorganization.

CONVOY ANNEX

1. Situation.
 - a. Enemy forces.
 - b. Friendly forces.
 - c. Attachments and detachments.
2. Mission.
3. Execution.
 - a. Concept of the operation.
 - 1) Maneuver.
 - 2) Fires.
 - b. Tasks to combat units.
 - c. Tasks to combat support units.
 - d. Coordinating instructions.
 - 1) Time of departure and return.
 - 2) Start point procedures.
 - 3) Don equipment ("jock-up").
 - 4) Loading plan.
 - 5) Order of movement.
 - 6) Route (primary and alternate).
 - 7) Security.
 - 8) Planned danger areas.
 - 9) Timeline.
 - 10) Preventive maintenance checks and services (PMCS).
 - 11) Headlight status.
 - 12) Air guards.
 - 13) Actions at off-loading and onloading point.
 - 14) Actions upon halts.
 - 15) Convoy speed.
 - 16) Vehicle interval.
 - 17) ROE.
 - 18) Rehearsals.
 - 19) Recovery plan.
 - 20) Action on enemy contact.
 - a) IED detonation.
 - b) Suspected IED.
 - c) Small-arms fire (direct or indirect).
 - d) Roadblock.
 - e) Disabled vehicle.
 - f) Down driver.

CONVOY ANNEX (CONTINUED)

- g) Dead end.
- h) Break in contact.
- 4. Service and support.
 - a. Individual.
 - b. Team.
 - c. Vehicle.
- 5. Command and signal.
 - a. Command.
 - 1) Chain of command.
 - 2) Location of leaders.
 - b. Signal (PACE).
 - 1) Call signs.
 - 2) Long range.
 - 3) Squad.
 - 4) Intervehicle.
 - 5) Hand and arm.
 - 6) Pyrotechnics.
 - 7) QRF.
 - 8) Close air support evacuation (CASEVAC).
 - 9) Code words.

FIVE-POINT CONTINGENCY PLAN

Leaders give a five-point contingency plan to subordinates as direction and guidance for actions that may happen during the leaders' absence. The leader leaves for many reasons throughout the planning, coordination, preparation, and execution of his patrol mission. Each time the leader departs without radio or wire communications, he must issue a five-point contingency plan. The contingency plan includes the following:

FIVE-POINT CONTINGENCY PLAN (GOTWA)

GOING: Where you are going.
OTHERS: Who you are taking with you.
TIME: Time you will be done.
WHAT: What to do if you do not return in time.
ACTIONS: Actions upon enemy contact for both elements.

ASSUMPTION OF COMMAND

Any member may have to take command of the unit at any time during an emergency. When this occurs, continuation of the mission may be necessary.

Assumption of Command

During the assumption of command, situation permitting, the following tasks must be accomplished applying METT-TC:

NOTE: Tasks are not necessarily accomplished in the following order:

- Inform the unit of the command change (use subordinate leaders), and notify higher HQ.
- Check security.
- Check crew-served weapons.
- Pinpoint your location.
- Coordinate, and check equipment status.
- Check personnel status.
- Issue FRAGO (if required).
- Reorganize, as needed, and move out as soon as possible.
- Maintain light and noise discipline.
- If done in a patrol base, do not violate the activities of the patrol base—especially security.

CALL FOR FIRE

The call for fire, shown on pages 67 through 69, is a concise message prepared by the observer. It contains all information needed by the fire direction center (FDC) to determine the method of target attack. It is a request for fire, not an order. It must be sent quickly but clearly enough that it can be understood, recorded, and read back, without error, by the FDC recorder.

CALL FOR FIRE

1. ***OBSERVER IDENTIFICATION:** Use call signs from the SOI.
2. ***WARNING ORDER:**
 - a. Type of mission:
 - (1) Adjust fire.
 - (2) Fire for effect.
 - (3) Suppress (planned target).
 - (4) Immediate suppression.
 - b. Size of element to fire:
 - (1) Omission indicates a request for one field artillery battery.
 - (2) Larger units by stating size desired.

CALL FOR FIRE (CONTINUED)

c. Method of target location:

- (1) Grid: No announcement.
- (2) Polar plot: Announce the word "polar."
- (3) Shift from a known point: Announce the word "shift"

followed immediately by the designation (target number) of the known point.

3. *TARGET LOCATION:

- a. Grid: Two-character, six-digit grid; for example, BS123456.
- b. Polar: Direction and distance to the target from the observer's position.
- c. Shift: Direction to the target.
 - (1) Lateral shift (left or right) in meters.
 - (2) Range shift (add or drop) in meters.
 - (3) Vertical shift (up or down) in meters, if significant.

4. *TARGET DESCRIPTION: A word picture of the target (for example, the number and type of vehicles and personnel observed).

5. METHOD OF ENGAGEMENT:

- a. Type of engagement:
 - (1) Area fire: Standard without request.
 - (2) Precision fire: Used only with destruction or registration missions.
- b. Danger close: Announced when applicable.
- c. Trajectory:
 - (1) Low angle: Standard without request.
 - (2) High angle: Upon request of observer or when required because of masking terrain.
- d. Ammunition:
 - (1) Type projectile desired in fire-for-effect phase.
 - (2) Type of fuze action desired in fire-for-effect phase.
 - (3) Volume of fire desired in fire for effect stated in rounds per howitzer.
- e. Distribution: Type sheaf desired. Parallel is standard without request.

6. METHOD OF FIRE AND CONTROL:

- a. Method of fire:
 - (1) Center platoon and center section (one weapon) is standard for adjustment phase.

CALL FOR FIRE (CONTINUED)

- (2) Battery or platoon right or left on request.
 - (3) Time interval (5 seconds is standard when (2) above is used).
 - b. Method of control.
 - (1) Fire when ready: Standard—no request required.
 - (2) At my command: Weapons fire at observer's command.
 - (3) Cannot observe: Fire will not be observed.
 - (4) Time on target: Rounds land at specified time.
 - (5) Continuous illumination: FDC will determine when to fire.
 - (6) Coordinated illumination: Observer determines when illumination is fired.
 - (7) Cease loading: Used on missions with more rounds in effect. Causes the firing unit to stop loading rounds.
 - (8) Check firing: Temporary halt in firing.
 - * Minimum information required.
- NOTE:** Danger close must be included when target is within 630 meters, 750 meters for naval guns 5-inch and under, and 1,000 meters for guns larger than 5 inches. Danger close adjustments are made in 100-meter increments.

NINE-LINE MEDEVAC REQUEST

Knowledge of the proper procedures for requesting a MEDEVAC is imperative to the survival of wounded Soldiers on the battlefield. The graphic on pages 69 and 70 outlines the information needed to properly request a MEDEVAC.

NINE-LINE MEDEVAC REQUEST

- 1. LOCATION OF PICKUP.**
- 2. RADIO FREQUENCY, CALL SIGN, AND SUFFIX.**
- 3. NUMBER OF PATIENTS BY PRECEDENCE.**
 - URGENT** - Must be evacuated immediately and in no case more than 2 hours to save life, limb, and eyesight.
 - PRIORITY** - Patient must be evacuated within 4 hours, or medical condition will deteriorate to urgent.

NINE-LINE MEDEVAC REQUEST (CONTINUED)

ROUTINE - Requires evacuation but condition not expected to deteriorate within next 24 hours.

TACTICAL IMMEDIATE - Medical condition is not urgent or priority but evacuation is needed as soon as possible to not endanger unit's tactical mission.

4. SPECIAL EQUIPMENT NEEDED.

Hoist, ventilator, and jungle penetrator are examples.

5. NUMBER OF PATIENTS BY LITTER AND AMBULATORY.

6. SECURITY TO THE PICKUP SITE (in peacetime becomes type of injury, wound, or illness).

No enemy troops in the area.

Possible enemy troops in the area.

Enemy troops in the area (approach with caution).

Enemy troops in the area (armed escort required).

7. METHOD OF MARKING PICKUP SITE.

8. PATIENT NATIONALITY AND STATUS.

U.S. Military.

U.S. Civilian.

Non-U.S. Military.

Non-U.S. Civilian.

EPW.

9. NBC CONTAMINATION (in peacetime becomes terrain description).

MARKING OF LANDING ZONE

A leader must have a clear understanding of landing zone (LZ) procedures and proper markings. Without proper markings, the LZ becomes dangerous to not only those on the ground but to the aircrews, too. LZ markings are listed in the graphic on page 71.

MARKING OF LANDING ZONE**1. SIZE (DIAMETER) OF LZ FOR ONE HELICOPTER**

OH-58	25 METERS
UH-1 & AH-1	35 METERS
UH-60 & AH-64	50 METERS
CH-47	80 METERS

2. SURFACE CONDITIONS

LZ should be free of tree stumps, large rocks, and other obstacles that might harm the aircraft, and firm enough to support the aircraft.

3. GROUND SLOPE

0 - 6%	LAND UPSLOPE
7 - 15%	LAND SIDE SLOPE
16% OR MORE	NO TOUCHDOWN

4. OBSTACLES

Use an obstacle clearance ratio of 10:1. For example, a 10-foot tree requires 100 feet of horizontal clearance if the aircraft must approach or depart directly over that tree.

5. MARKING - INVERTED Y**PRECOMBAT INSPECTIONS**

Precombat inspections (PCIs) will be dictated primarily by mission requirements and by unit SOP. The general vehicle (page 72) and individual Soldier checks (page 72) and the precombat inspection list (pages 72 through 75) provide a baseline on which leaders can expand.

GTA 33-01-001

GENERAL VEHICLE CHECKS:

1. Proper vehicle load plan	13. Fire extinguisher on hand and serviceable
2. Fuel level (including fuel can[s])	14. Fluid levels checked
3. Emergency POL packed	15. Lights and blackout drive functional
4. Water can(s) full and potable	16. Spare tire good
5. Meals, ready to eat (MREs) loaded	17. Vehicle warning triangle on hand
6. First-aid kit loaded and functional	18. Seat belts worn and serviceable
7. Operator (-10) technical manuals (TMs) on hand	19. Camouflage nets and poles loaded
8. BII/OVM loaded and serviceable	20. All navigation gear functional
9. Vehicle radio loaded and operational	21. Proper dispatch and military license
10. Nine-line MEDEVAC request posted	22. Turret functional
11. Maps on hand and oriented	23. Loudspeaker operational
12. No Class III leaks	

INDIVIDUAL SOLDIER CHECKS:

1. Packing list—
 - Clothing and equipment
 - NBC gear
 - Identification (ID) tags, ID card, and military license
 - Water in canteens
 - Appropriate mission-oriented protective posture (MOPP) gear worn or carried
 - Specifically assigned team gear
2. Sensitive items—
 - Weapon (with cleaning kit)
 - Night vision devices (NVDs)
 - Precise lightweight GPS receiver (PLGR) and GPS
 - Automated net control device (ANCD)
3. Do they know the mission, situation, and detailed plan?
4. Do they know the challenge and password and comm call signs and frequencies?

PRECOMBAT INSPECTION LIST

- 1. Individual Preparation for Combat.**
 - a. Seasonal uniform.
 - b. Proper field uniform worn according to climate and mission.
 - c. Load-bearing equipment (LBE) properly assembled and serviceable.

PRECOMBAT INSPECTION LIST (CONTINUED)

- d. First-aid pocket complete.
 - e. Earplugs and case.
 - f. Full canteens with M17 drinking cap.
 - g. Kevlar helmet with camouflage cover and rank and helmet band with cat's eyes and name printed on band.
 - h. Individual weapon with magazines loaded and with sling. M9s must be secure with lanyards or 550 cord.
 - i. Night vision goggles (NVGs) complete, tied down, and operational with extra batteries.
 - j. Weapons cleaning kit.
 - k. ID tags around neck.
 - l. ID card on individual.
 - m. Current driver's license (CONUS and USAREUR).
 - n. Compass.
 - o. Eye protection (wind/dust goggles).
 - p. Wristwatch (optional).
 - q. NBC gear (training only):
 - 1) Protective mask with prescription inserts, if applicable.
 - 2) MOPP suit.
 - 3) M8 paper (1 pack).
 - 4) M256A1 sampler packet (1).
 - r. NBC individual chemical equipment (ICE) pack (real-world mission):
 - 1) Protective mask with prescription inserts, if applicable.
 - 2) MOPP suit.
 - 3) Gloves.
 - 4) Overboots.
 - 5) Filters for mask (2).
 - 6) M8 paper (2 packs).
 - 7) M291 kit (skin decontamination kit [SDK]).
 - 8) M295 (individual equipment decontamination kit [EDK]).
 - s. Briefed on current mission and situation.
 - t. Briefed on prevention of hot and cold weather injuries. Previous hot or cold weather injuries identified and properly marked.
 - u. Body armor worn properly.
- 2. Vehicles.**
- a. Current, valid PMCS and properly dispatched.
 - b. Operator (-10) TMs on hand.

PRECOMBAT INSPECTION LIST (CONTINUED)

- c. Pioneer tools complete, properly stored, clean, and serviceable.
- d. Tools and tool bag complete.
- e. Loaded according to loading plan.
- f. TA-50 loaded per loading plan.
- g. Fuel tank no less than 3/4 full.
- h. Fuel cans full (2).
- i. Water cans full (2).
- j. Fire extinguishers mounted, sealed, tagged, updated, and serviceable.
- k. MRE rations.
- l. First-aid kits complete.
- m. Combat lifesaver (CLS) bag complete.
- n. M249 squad automatic weapon (SAW) properly mounted with ammunition, if applicable.
- o. ASIP radios (2) with current fill, operational and properly mounted.
- p. Additional (2) hand microphones.
- q. MBITR AN/PRC-148 with fill and extra batteries.
- 3. PSYOP-Specific Equipment.**
 - a. Mounted operations (see TM for further detail).
 - b. Tactical loudspeaker system (family of loudspeakers [FOL]) complete and operational:
 - 1) Low-frequency (LF) speaker cover.
 - 2) LF module.
 - 3) High-frequency (HF) speaker cover.
 - 4) HF speaker array.
 - 5) HF array support tray.
 - 6) Control module assembly.
 - 7) Recorder and reproducer.
 - 8) Amplifier array assembly.
 - 9) Speaker stand assembly.
 - 10) HF speaker cables (15 feet and 50 feet).
 - 11) LF speaker cables (15 feet and 50 feet).
 - 12) Control cables (6 feet and 25 feet).
 - 13) Single-channel ground and airborne radio system (SINCGARS) adapter cable (6 feet).
 - 14) System power cable, vehicle.
 - 15) Amplifier mounting base.

PRECOMBAT INSPECTION LIST (CONTINUED)

- 16) Guard assembly, amplifier.
- 17) Loudspeaker, interface, vehicle.
- c. Additional AA batteries for minidisc player and tape player.
- d. Additional minidisks and cassette tapes.
- e. PSYOP products (sounds, leaflets, posters, and so on) present.
- f. M246A1 kit complete.
- g. M274 marking kit complete.
- h. M9 tape (1 roll).
- i. Dismounted operations (see TM for further detail).
- j. Tactical loudspeaker manpack (40C) complete and operational:
 - 1) Speaker array assembly.
 - 2) Amplifier and battery box.
 - 3) Control module assembly.
 - 4) Recorder and reproducer.
 - 5) Speaker cable (3 feet).
 - 6) SINCGARS radio adapter cable (6 feet).
 - 7) Control cable (6 feet).
 - 8) System interconnect cable (25 feet).
 - 9) Remote control cable (25 feet).
 - 10) Speaker extension cable (50 feet).
 - 11) Field pack.
 - 12) BA 5590 batteries (3).
- k. MBITR AN/PRC-148 radio operational with current fill.
- l. Long- and short-whip antennas.
- m. Additional (2) hand microphones.
- n. Additional AA batteries for minidisc player and tape player.
- o. Additional minidisks and cassette tapes.
- p. Additional BA 5590 batteries.
- q. PSYOP products (sounds, leaflets, posters, and so on) present.
- r. CLS bag complete.
- s. M256A1 kit complete.
- t. M274 marking kit complete.
- u. M9 tape (1 roll).

ABSTRACT

Psychological operations encompass all courses of action which are planned and conducted to create emotions, attitudes, or behavior favorable to the achievement of national policies and objectives. These operations support, in the realm of ideas, national, political, economic, and military policies from the nature and character of which the psychological operations draw their strength.

Russian heritage provides a national value system which predisposes the Soviet Union to the employment of psychological operations in the conduct of a completely integrated foreign policy. No policy action is taken without consideration of its psychological impact.

Almost the reverse of this situation is encountered in American experience, attitude, and employment of psychological operations. The history of this instrument in American foreign policy has been one of rejection or reluctant use.

Before the United States can employ the psychological instrument effectively, it must develop an integrated planning process for the achievement of its foreign policy goals. To coordinate and to conciliate a total program from the individual programs of member activities has been the American pattern. A solution will evolve only after the

government agencies are no longer permitted to decide whether or not they will carry out the letter and spirit of the Chief Executive's policies. Effective organization and positive leadership will provide this.

Government agencies are no longer permitted to handle sensitive information. The law also prohibits the government from using the information for any purpose other than the one for which it was collected. The law also prohibits the government from disclosing the information to any other person or entity. The law also prohibits the government from using the information for any purpose other than the one for which it was collected. The law also prohibits the government from disclosing the information to any other person or entity.

TO THE SOLDIER WHO MARCHES WEST¹

You are still alive. It is wonderful. Everything that lives is wonderful, even the green grass and the birds.

The dead and the rocks and the soil and the dung—they are nothing, for they have no life.

We who have life have everything; we possess fabulous wealth.

The rocks, the dead and the soil have nothing, are nothing.

Where will your road lead you, soldier? Are you going West? Are you going to Paris?

Do you know what is in the West, soldier? I shall tell you, soldier; listen.

In front of you are the English, you know that. The French and the Americans are behind them. You also know how they fire into the lines of your comrades. Perhaps they will retreat and new regiments will march ahead. Then they will fire again. Then the Allies retreat again.

But the firing never ceases

There is something else in the West. I shall tell you what this "something" is. Nobody can tell you exactly where it is, but it surely is in the West.

Your grave lies in the West.

If you march West, you can't help finding it. Possibly it is far ahead of you, behind the mountains. But possibly it is very near you, perhaps you can see it. Today or tomorrow--nobody knows. But surely, the grave lies there, as surely as does the sunset.

Do you march West, soldier? Then we say good-by to you. All of us who live say good-by.

There are only two things on earth, the living and the dead. The difference between these two things is greater than that between friend and foe, greater than that between man and animal. It is the greatest difference in this world. With the dead one you cannot marry, to the dead one you cannot be a friend, you can't talk with him, you don't touch him. If you march West, soldier we say good-by, we who are alive.

Men and women, dogs and birds and insects--they
shall not be with you any more

Soldier, farewell.

Today, you are one of us; you are one with men and
women and everything that lives. You are master of
the rocks and the woods and all inanimate things.

Tomorrow you march West.

Soldier, farewell.

Do you hear our voice?

Farewell.

CHAPTER I

PSYCHOLOGICAL WAR AND OPERATIONS

Psychological operations encompass those political, military, economic, and ideological courses of action which are planned and conducted to create in enemy, hostile, neutral, or friendly groups emotions, attitudes, or behavior favorable to the achievement of national policies and objectives. These operations are included within and implement psychological warfare and psychological activities. At one time, it was fashionable to differentiate between these two forms of psychological action on the basis of the existence or non-existence of a state of war or declared emergency or on the basis of the existence or non-existence of active military operations in a military theater of war.

I. INTRODUCTION

Today, we live in a twilight world of half-war and no peace. We have been involved in this twilight conflict since the conclusion of the Second World War. The future promises no foreseeable conclusion. At stake are the national survival, the continuation of respective political systems, and the pursuit of state goals of the United States and the Soviet Union. Such a contest is a war, irrespective of terminology or of the methods employed in its prosecution.

It seems, therefore, fallacious to approach the conduct of this war in terms other than those of stark reality. The psychological operations involved are the strategies and tactics of psychological war, nothing less. We are involved in a war, not merely in an activity; and there are no theaters where active operations are not in existence.

Modern, total warfare has three major divisions: military, politico-economic, and psychological. Psychological warfare serves as a framework or weapons-mount which provides an interchangeability within and between these three major divisions and which gives their integrated employment the widest conceivable effectiveness. Hence, psychological warfare emerges as a tool of national security policy which

injects into the "unpsychological" wars of the machine age the recollection and rediscovery of man as the agent of aggression, the object of suffering, and the human element in bureaucratized strategy and industrialized battles.¹

II. DEFINITIONS AND EARLY USAGE

Psychological warfare has been defined as warfare psychologically waged;² that is, operations carried out with

¹Hans Speir, "Psychological Warfare Reconsidered," Propaganda In War and Crisis, ed. Daniel Lerner (New York: George W. Stewart, Inc., 1951), p. 464.

²War Department General Staff, Propaganda Branch, Intelligence Division, A Syllabus of Psychological Warfare (The Pentagon, Washington, 1946), pp. 2-3.

close and studied reference to the politics, opinion, and morale of the enemy. In the broad sense, psychological warfare is the application of portions of the science of psychology to further the efforts of political, economic, or military actions. Its principal vehicle, propaganda, is the use of any form of communication to disseminate material designed to affect the minds and actions of a given group for a specific public purpose, whether military, economic, or political. In American usage, psychological warfare connotes propaganda designed to achieve national policy goals in the world political arena. This American concept of psychological warfare is somewhat less comprehensive than other terms with which it is closely linked. The more inclusive concept is that of "political warfare"--the term used by the British--which encompasses more than the means of mass communication or the handling of weapons to achieve maximum impact on the will to resist. Political warfare contributes the important concept that all instruments of policy need to be correlated properly in the conduct of war.³ Effective national psychological warfare demands the inclusion of this concept of political warfare within its purview.

Psychological warfare is the recent name for an idea

³Harold D. Lasswell, "Political and Psychological Warfare," Propaganda In War and Crisis, ed. Daniel Lerner (New York: George W. Stewart, Inc., 1951), pp. 264-265.

as old and as widespread as mankind. The idea of using psychology as an adjunct to military action is expounded in the earliest known manuals on strategy and tactics. In the fifth century B.C., Sun Tzu wrote in his Book of War on the importance of destroying the enemy's will to fight by such means as surprise, show, and noise. Essentially the same principles are set forth in the military literature and prevailing maxims of the ancient empires of India and the Middle East. The East Indian political classic, Kantilya's Arthasastra, contains advice on how to destroy enemy morale and build up one's own.⁴ In these works, emphasis is placed on what is now called "propaganda of the deed"; that is, the assassination of important officials, the show of force, the achievement of surprise, and the taking of emotionally significant cities.

One of the earliest recorded applications was by Gideon in his great battle with the Midianites (by traditional reckoning, 1245 B.C.). Another Old Testament story relates how Joshua circled Jericho for seven times on seven days, sounding the trumpet, "and the walls came tumbling down."

The Greeks employed the "Trojan Horse" to infiltrate and undermine a mighty fortress-city that they could not

⁴Ibid., p. 261.

as one of the most important in the world. The fact is that the
country is so situated in relation to the world as to be
able to produce almost all the things that are needed. In the
first place, it is a country of great size. It has a large
population and a large area. It is a country of great
resources. It has a large amount of land and a large
amount of water. It has a large amount of coal and a large
amount of iron. It has a large amount of gold and a large
amount of silver. It has a large amount of copper and a large
amount of tin. It has a large amount of lead and a large
amount of zinc. It has a large amount of nickel and a large
amount of cobalt. It has a large amount of manganese and a large
amount of chromium. It has a large amount of vanadium and a large
amount of niobium. It has a large amount of molybdenum and a large
amount of tungsten. It has a large amount of rhenium and a large
amount of ruthenium. It has a large amount of rhodium and a large
amount of palladium. It has a large amount of silver and a large
amount of gold. It has a large amount of platinum and a large
amount of iridium. It has a large amount of osmium and a large
amount of selenium. It has a large amount of tellurium and a large
amount of polonium. It has a large amount of astatine and a large
amount of francium. It has a large amount of actinium and a large
amount of thorium. It has a large amount of uranium and a large
amount of plutonium. It has a large amount of americium and a large
amount of curium. It has a large amount of berkelium and a large
amount of californium. It has a large amount of einsteinium and a large
amount of fermium. It has a large amount of mendelevium and a large
amount of nobelium. It has a large amount of lawrencium and a large
amount of rutherfordium. It has a large amount of dubnium and a large
amount of seaborgium. It has a large amount of bohrium and a large
amount of hassium. It has a large amount of meitnerium and a large
amount of darmstadtium. It has a large amount of roentgenium and a large
amount of copernicium. It has a large amount of nihonium and a large
amount of flerovium. It has a large amount of tennessine and a large
amount of oganesson.

THE END

reduce by siege. Herodotus tells how Themistocles subverted the Ionians, who were satellites of the Persians. Messages were engraved on stones near their watering holes to remind them of their common Greek heritage, and with the added line that, if they could not defect, they should behave badly in battle.⁵ This was also a source of excellent propaganda intended to make the Persians think that any Ionian less than perfect was a secret Athenian sympathizer. This appeal was sound by all modern standards.⁶

The Romans employed a ritual of "evocatio," which can be traced back to the Hittites, by which the Romans implored the protective gods of the enemy city to pass over to the Roman camp. Some versions tried to bribe the enemy gods with promises of more sumptuous temples. Machiavelli, in his fascination with the problems of besieged cities, came to the conclusion that the Roman method of psychological operations was probably more effective than the measures used against them by their enemies.⁷ An early example of correct target selection occurred in the First Punic War, when the Romans, having fled in panic on their first

⁶Ibid.

⁷Niccolo Machiavelli, The Discourses (New York: Columbia University Press, 1940), p. 371.

encounter with the Carthaginian war elephants, retaliated by driving pigs in front of them to stampede the elephants.

The Mongol conquests were accomplished through the use of highly mobile forces, the exploitation of intelligence, the coordination of strategy, and the application of propaganda in all its forms. The Mongols deliberately used rumor to exaggerate accounts of their numbers and ferocity; they even used enemy spies to promote these rumors by boasting and by staging demonstrations to impress known spies and enemy emissaries in their midst. Although the Mongols carried out superb strategic and tactical propaganda operations, they never solved the problem of consolidation and failed to win the loyalty of the conquered peoples.

No examination of early psychological operations would be complete without noting that Cortez used horses to spread terror among the Aztecs and also exploited legends of the Fair God; that the Inquisition was a psychological warfare instrument of the Spanish rulers, Ferdinand and Isabella; that the European feudal classes identified the peasants with filth, anarchy, murder, and cruelty; that the Manchus, with odds of four hundred to one against them, used terror to nullify Chinese superiority; that the Tokugawa Shoguns used preventive psychological warfare, after 1636, to enmesh the minds of the Japanese people; that the British East India Company used propaganda in conquering India

against overwhelming numerical superiority; and that both before and during the French Revolution, revolutionary propaganda was rife.

In America, Whig propaganda was energetic in leading to colonial defiance of England. At Bunker Hill, the Colonists used one of the very earliest versions of front-line combat propaganda, a desertion leaflet for British soldiers. Paine's Common Sense and Washington's just and moderate political and military measures provided a base for patriot propaganda operations. During the Mexican War, both sides employed propaganda, but which was the more successful is difficult to determine. The Mexican effort was certainly not without effect, for the guns defending Mexico City were manned by traitor American artillerymen.⁸ Historians in both countries gloss over the treason and subversion which occurred on each side. In the Civil War, psychological operations were carried out by both sides, both against the other and to influence opinion in England and on the continent. Lincoln's Emancipation Proclamation ranks as one of the great strokes of psychological warfare.

ramifications of international relations since 1914 reveals an ever-increasing emphasis on ideology, or political faith, as a driving force. An ideology is a system of deep-rooted beliefs about fundamental questions in human life and affairs.⁹ Ideology, therefore, plays an important part in psychological warfare.

The earliest form of ideology was apparently religion.¹⁰ It was the first group of ideas which decisively influenced the mentality and behavior of primitive man and primitive society. The social ideologies developed later and were, at first, intimately fused with the all-dominating religious conception of the universe. In the later evolutionary phase, the social and political ideologies separated from the religions which, more and more, lost their domination over individuals and societies. The latest step in this evolutionary process is the non-religious but totalitarian ideology which appears in recent history in a more and more vigorous and sharply-defined shape.

Ideologies pass, at times, through inactive periods, sometimes centuries in duration. There are also phases of ideological expansion. These are the phases of conquest,

⁹Ibid., pp. 30-32.

¹⁰Bela Szunyogh, Psychological Warfare (New York: The William-Frederick Press, 1955), p. 46.

the stage for the most active propaganda, for the blindest fanaticism, and for merciless intolerance. These phases represent a very important form of psychological warfare; they are Wars of Faith.

The expansion of the Muslim Creed and Empire provides a great deal of information which should not be neglected in the twentieth century. The emirs of the Arab conquests demonstrated two principles of long-range, psychological warfare which are still valid.

A people could be converted from one faith to the other if given the choice between conversion and extermination, stubborn individuals being rooted out. To effect the initial conversion, participation in the public ceremonies and formal language of the new faith were required. Sustained counter intelligence remained on the alert against back sliders. Formal acceptance would eventually become genuine acceptance by denying public media of expression to the vanquished faith.

If immediate, wholesale conversion required too extensive or severe operations, the same result could be achieved by toleration of the objectionable faith, combined with the issuance of genuine privileges to the new, preferred faith. The conquered people were left in the private, humble enjoyment of their old beliefs and folkways. However, all participation in public life, be it political, cultural,

or economic, was conditioned upon acceptance of the new faith. In this manner, all up-rising members of the society would move in a few generations over to the new faith in the process of becoming rich, powerful, or learned; what was left of the old belief became a gutter superstition, possessing neither power nor majesty.¹¹

These two rules worked admirably in the Muslim conquests. The Germans employed them in World War II; the Soviets have employed them continuously since 1917. The first method is difficult and bloody, providing quick results. The second rule is slow but as irresistible and as sure as the movement of an ice age glacier. Whether the process is termed the "capture of the rising elite" or the "utilization of potential leadership cadres from historically superseded classes," the effect is the same. If men are placed in a position of underprivilege and shame because of their beliefs and if a way is provided for voluntary conversion to the winning side, the winning side will, sooner or later, convert almost everyone who is capable of making trouble.¹²

¹¹Linebarger, op. cit., pp. 8-14 ff.

¹²Ibid., p. 13.

IV. THE ROLE OF PROPAGANDA

Psychological warfare is waged before, during, and after wars--it is everlasting and no one, anywhere, ever escapes its tentacles. It has become a constant part of international relations. Its principal vehicle is propaganda. Propaganda is by no means something new in the struggle of mankind; but its conscious and scientific application by means of modern, high-speed methods of mass communications has lent it an importance infinitely greater than it enjoyed in by-gone days. Because it has the means of reaching mass audiences, psychological warfare is, therefore, a potentially deadly weapon.

The word "propaganda" was originally applied to an activity which was inspired by very laudable motives. In the Roman Catholic Church, the College of Propaganda was a committee of cardinals whose task it was to adapt the teachings of Christianity to the practices and customs of people in widely different parts of the world.¹³ Every doctrine or ideology, no matter how noble, is likely to encounter difficulties in getting itself properly understood. A good propagandist is merely one who knows how to present his ideas effectively, and the arts of propaganda are merely the

¹³Carroll C. Pratt, Psychology: The Third Dimension of War (New York: Columbia University Press, 1942), p. 18.

means by which a point of view can best be made acceptable. Propaganda, however, is successful only when there is a positive policy to be sold, imaginative and creative spokesmen to sell it, and detailed knowledge about the audience and its aspirations.

V. ELEMENTS OF PROPAGANDA

In the field of propaganda, there are five general areas or elements into which it may be broken and examined: source, time, audience, subject, and mission. These analysis factors are useful in portraying the spectrum across which propaganda is employed.

Source is the most important element. An overt and acknowledged source implies that the government issuing the message is placing it before the world. This requires dignity and an eye to the future and is most effectively accomplished through responsible public officials, preferably with international reputations, who will realize the best effect from the use of the name and facilities of the government. If the source is faked, it is very important for the government to ensure that the propaganda cannot be traced back readily. Covert sources require persons adept at illicit imaginativeness and with a strong sense of discipline and security.

means by which a point or line can have the same properties.
 Furthermore, however, is important only when it is
 relative to the point, and the relative to the point
 can be said to, and the relative to the point
 and the relative.

 The ninety-ninth is the theorem. The hundredth is the theorem.

In American practice, source is generally considered as falling into three categories:¹⁴

1. White propaganda issued by an acknowledged source, usually a government or an agency of the government.
2. Grey propaganda issued by an ill-defined source.
3. Black propaganda purportedly issued by a source other than the true one.

In terms of the time-span of the propaganda, a subdivision into the categories of strategic and tactical can be made.

Strategic propaganda is directed at enemy forces, areas, people, or nations in their entirety and, in coordination with strategic planning, is designed to achieve results planned and sought over a period of psychological changes that may extend over long periods.

Tactical propaganda is directed at specific audiences, usually named, and is prepared and executed in support of localized, ad hoc operations. It is employed to achieve an immediate, short-range purpose and normally does not cover a long time interval.

Propaganda is so intimately keyed to the news and opinion situation that it does not usually bear elaborate pre-operational analysis. However, on a national policy

¹⁴Linebarger, op. cit., pp. 44-45.

On January 1951, the first of the series of meetings
on taking into account the following:

1. The first meeting, held on 19 January 1951, was
usually a meeting on the subject of the
Government.

2. The second meeting, held on 26 January 1951, was
usually a meeting on the subject of the
Government.

In June of the following year, the Government, a
division into the subject of the Government, and
the State,

Finally, the Government is divided into three parts:
first, second, and third. In each of these parts, the
first with the subject of the Government, is divided into
first and second. The first part of the Government is
first and second. The second part of the Government is
first and second. The third part of the Government is
first and second.

Finally, the Government is divided into three parts:
first, second, and third. In each of these parts, the
first with the subject of the Government, is divided into
first and second. The first part of the Government is
first and second. The second part of the Government is
first and second. The third part of the Government is
first and second.

Finally, the Government is divided into three parts:
first, second, and third. In each of these parts, the
first with the subject of the Government, is divided into
first and second. The first part of the Government is
first and second. The second part of the Government is

level, propaganda can be categorized as offensive or defensive in nature with regard to the audience envisioned.

Defensive propaganda is designed to maintain an accepted and operating form of social or other public action in the face of a simultaneously hostile propaganda operation.

Offensive propaganda is designed to interrupt a social action not desired by the propagandist or to predispose to a social action which he desires, either through revolutionary means (within the same society) or international means, diplomatic or belligerent (between different societies).

Among the infinite number of propaganda purposes which a psychological warfare group may have in mind for the audience are several broad categories of mission:

Conversionary propaganda is designed to change the emotional or practical allegiance of individuals from one group to another.

Divisive propaganda is designed to split apart the component sub-groups of the enemy and thereby reduce the effectiveness of the enemy group, considered as a single unit.

Consolidation propaganda is directed toward civil populations in areas occupied by a military force and is designed to insure compliance with the commands or policies promulgated by the commander of the occupation forces.

level, however, can be distinguished in principle on basis
 of the nature of the system in the *physical* domain.
 Collective systems are defined as systems in
 which the behavior of each of the parts is
 determined by a relationship with the other parts.
 In the case of a collectively defined system, the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.
 In the case of a collectively defined system, the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.
 In the case of a collectively defined system, the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.

From the nature of the system, it follows that
 a collectively defined system is one in which the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.
 In the case of a collectively defined system, the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.
 In the case of a collectively defined system, the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.

From the nature of the system, it follows that
 a collectively defined system is one in which the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.
 In the case of a collectively defined system, the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.
 In the case of a collectively defined system, the
 behavior of each part is determined by the behavior
 of the other parts. In the case of a collectively
 defined system, the behavior of each part is
 determined by the behavior of the other parts.

Counter propaganda is designed to refute a specific point or theme of enemy propaganda.

Most of these distinctions are in reality theoretic terms and rarely find expression as a single, pure, operational entity. The basic distinctions are determined by the task involved and not by the propaganda content.¹⁵

The voice of propaganda must be self confident and convincing at all times. The propagandist must take the imperturbable stand that he can prove anything. He is never wrong, and he must never show any resignation or depression. He can prove any statement, even if it appears absurd at first view. Even if a part of the audience ridicules the speaker, others will give him credit. No failure can be allowed to weaken the speaker's confident words. When all people despair, he cannot despair; for when the propaganda fails, the fall of the movement is inevitable.

Propaganda is made up of words which are adjustable to every situation. It is of minor importance what the subject of the discussion is; what matters is the way it is spoken. Proper words may conceal any fact or may glorify unimportant details to an extreme. The importance of vocabulary is easily recognized by reading the following collection of words and expressions taken from communist writings:

¹⁵Ibid., pp. 43-48 ff.

...the ... is ... to ... a ...

... as ... of ...

... of ... and ...

... and ... the ...

... the ... by the ...

... the ...

. . . aggression, flunky, warmonger, enemy of the people, exploitation, mass-demonstration, hostility toward the workers, world peace organization, heroic laborer, reactionary, fighting group, landrobber, stooges, imperialists, the great patriotic war.

The mere collection of these words evokes a certain feeling. They are heavy with emotion, power and intolerance; and they are without mercy. The success of communist propaganda is to be attributed, in part, to such powerful and very dynamic language which strikes the opponent with an annihilating verve and passion.

VI. POLICY GOALS AND PROPAGANDA

Propaganda is the tool, not the master, of policy, although effective propaganda always has some policy. The policy probably will not have been made by propagandists, and it most certainly will not remain forever the same. If the propaganda is consistent with what is known, or believed, of the policy, then it can be effective, otherwise it cannot.

Long-range goals are statements of ultimate and mid-course purposes of life in the body politic. The task of policy is to re-examine and redefine the operational connotations of these long-range goals in the light of current events, needs, and demands, so as to insure that these parameters continue to define the type of future sought by the state and its people. Since policy is the sequence of governing decisions in any body politic, it inevitably

...the ... of the ...

fluctuates as changing conditions alter issues and modify alternatives. Although its guiding policy may shift, the purpose of propaganda remains constant: to serve policy with maximum effectiveness. However, without clear policy goals firmly in control of utterances, propaganda may move its audience--but in no direction or in the wrong direction.

In world politics, policy employs four instruments to achieve its goals: propaganda (persuasion), diplomacy (negotiation), economics (bargaining), and war (coercion). Their respective vehicles are symbols, contracts, commodities, and violence.¹⁶ War, economics, and even diplomacy operate upon the material environment. The propaganda function is to advance policy goals by manipulating the symbolic environment. What people believe about the future shapes their responses to present events. It is these beliefs about the future--the structure of expectations--which propaganda attempts to modify on behalf of policy goals.

The manipulation of expectations is an instrument with powerful uses but also with definite limits. The fundamental limitation is inherent in the instrument: its strategy is persuasion and its vehicle is the symbol. Propaganda does not change conditions but only beliefs about

¹⁶Daniel Lerner, "Effective Propaganda: Conditions and Evaluation," Propaganda In War and Crisis, ed. Daniel Lerner (New York: George W. Stewart, Inc., 1951), pp. 344-346.

conditions; it cannot force people to change their beliefs but can only persuade them to do so.

Propaganda is effective when it achieves a modification of audience behavior which alters the distribution of power in ways advantageous to the policy of the propagandist.¹⁷ Policy goals thus define one set of limits for propaganda activity--by postulating what is desirable. A second set of limits is defined by audience predispositions--which determine what is possible. Propaganda strategy operates within the terrain bounded by these policy and audience considerations.

It is important to recognize that the behavioral consequences of modified expectations need not appear immediately. In fact, some of the most important consequences of any attitude alterations appear only in the long-range future. Propaganda attempts to adjust the timing of the behavioral consequences it seeks to the short-range or long-range aims of its policy goals.

One requirement of sound policy is the classification of goals; a second is their instrumentation. Psychological warfare in support of policy must, first, clearly define its objectives and the methods through which it proposes to attain them. Second, it must determine with regard to

objectives and methods, the popular aspirations of those to whom the psychological appeal is addressed. Third, it must determine to what extent psychological warfare is capable of supporting political policy.

VII. INTELLIGENCE AND PSYCHOLOGICAL OPERATIONS

Assuming that clear goals and firm policy are available for the conduct of psychological operations, to move towards instrumentation of these goals demands adequate intelligence of conditions. The crucial service rendered to policymaking by the intelligence function is perhaps the most serious area of ignorance in our present understanding of the political process. The instruments of policy activate policy decisions by continuously modifying present conditions toward future goals. Policy specifies the desired ends; intelligence appraises the available means. Each of the policy instruments (propaganda, diplomacy, economics, and war) has its destructive techniques, but all are to be appraised by the criterion of effectiveness.¹⁸ Intelligence is, therefore, indispensable to both policy and psychological operations.

Each sphere of policy is to some extent an end and to some extent a means. Thus, for example, every proposed

¹⁸Lerner, Propaganda in War and Crisis, op. cit., XIV-XV.

objectives and interests, the feasible objectives of those to whom the psychological appeal is addressed. Third, it was determined that many psychological studies in regard to suggesting political action.

VII. INTELLIGENCE AND POLITICAL DECISIONS

According to the above points and the policy and intelligence for the conduct of psychological operations, to some extent instrumentation of these points means suggest intelligence of conditions. The special system required to intelligence by the intelligence function in general and that which are of interest in the present understanding of the political process. The instruments of policy involve policy decisions by intelligence, including research, analysis, and other factors. Policy specifies the desired ends; intelligence specifies the available means. Part of the policy instrument is intelligence, including, economic, and other factors. Intelligence, however, is not to be confused with the collection of intelligence, but all are to be part of the collection of intelligence. Intelligence is, therefore, intelligence to which policy and psychological operations.

Each report on policy is to some extent an act and is also a means. Thus, the knowledge, which suggests

military policy must be evaluated with reference to other objectives in that sphere and to the goals in the spheres of diplomacy, economics, and psychology. Intelligence can clarify goals and alternatives and provide needed knowledge. The types of knowledge needed for psychological policy may be classified: (1) distribution of attitudes, (2) trend of attitudes, and (3) comparison of available alternatives with past situations and with scientific findings. Attitudes, in turn, can be inferred from many kinds of data such as: (1) what people say and do, (2) what is said to people, and (3) what is done to people.¹⁹

The organization of the intelligence function calls for the proper articulation of many specialists with the policy makers. Psychological operations and propaganda are not the same as advertising. Psychological warfare is a task of extraordinary complexity, requiring intellectuals, scholars, journalists, political philosophers, and specialists with creative imaginations in the fields of political sociology, social psychology, history, cultural anthropology, and communications. Psychological warfare must understand and reach the people for whom it is intended. This is not a job for stodgy, conformist bureaucrats.

¹⁹Harold D. Lasswell, "Policy and the Intelligence Function," Propaganda In War and Crisis, Daniel Lerner (ed.) (New York: George W. Stewart, Inc., 1951), pp. 55-58 f, 61 f.

science with various disciplines in the field of political
science, social psychology, history, natural science
and communication. Geographical science and technology
and social science for the people is a science. There is only a

VIII. PSYCHOLOGICAL OPERATIONS AND POLICY FORMULATION

The relationships between those who formulate authoritative declarations of policy and those who perform the intelligence function require constant refinement and redefinition. Psychological material is less definitive than technical reports, and its adequate presentation demands a close personal relationship amongst planning personnel. If psychological operations are to be correctly related to policy, psychological planners must occupy a prominent position in all circles and levels of policy councils. Only through constant emphasis can policy makers come to recognize and sense the full degree of their reliance upon certain facts for basic clarification of their task.

Policy makers often leave goals phrased in ambiguous language that is open to misinterpretation, and it is one of the functions of the intelligence branch to point out any ambiguity and to seek out an authoritative declaration. Psychological operators continually ask for new specifications of objectives. Many times the goals enunciated by the makers of policy are inconsistent or even contradictory. On other occasions, authoritative statements are entirely missing in reference to many zones of action. In this process of clarification of goals, the psychological operator

rapidly discovers that there can be no clarification unless the need for integrated policy is widely felt. It is at this point where the nicest balance must be observed. To attempt to force a rigorous proclamation of purpose may not only fail to carry the policy group along but may lead to the rejection of disciplined fact gathering.²⁰ Yet, failure to keep the need of clarity at the focus of policy-making attention may result in a critical delay in adjustment to reality.

IX. IMPONDERABLES OF PSYCHOLOGICAL WARFARE

In physical warfare, the inherent instability in every situation, including such variables as weather, is partly compensated for by the ponderable factors. In psychological warfare, there is virtually nothing that can be calculated. The target--the enemy mind in its entirety--is a factor beyond the absolute, finite understanding of man. The propagandist can define: (1) the specific kinds of demoralization or discord he wishes to create, (2) the particular enemy audiences in which he wishes to create them, (3) the types of arguments he proposes to use, and (4) the media through which he will project his propaganda; but very

²⁰ Ibid., pp. 66-67.

regarding themselves, these cases can be an illustration of the
 the same for international policy as widely held. It is not
 this point where the direct action must be observed. It
 attempts to form a complex position of response and not
 only fail to carry out policy group along the way but
 the rejection of international law is being. The rejection
 to keep the need of liberty is the basis of political
 attention may result in a serious risk in judgment in
 reality.

II. CONSEQUENCES OF INTERNATIONAL ACTION

It is not always, the interest involved in
 every situation. Involvement with interest in action, in
 policy development and in the community interest, in the
 political action, which is actually being done and in
 political. The policy—this policy is in the interest—
 a policy beyond the political, which is being done at
 the political level. It is the political level as
 involvement in action is shown in action. It is the
 political level, which is shown in action. It is the
 (1) the policy in response to action in action, and (2) the
 policy in action which is shown in action. It is the
 policy in action which is shown in action. It is the

little more.²¹ The honest psychological operator will admit that he does not know where he is at any given moment, how far he is from his starting point, or how near he is to his goal. The propagandist can never say, "this consideration is now finished; let us proceed to the next phase."

Psychological warfare is far more complex than a single propaganda campaign, and the key to its effective use lies in an appreciation of its possibilities and its limitations. Psychological warfare officers and researchers must develop a realistic, specific, and mature approach to the problems that actually arise. They must realize that the basic principles of war apply also in psychological warfare. Further, psychological factors must be taken into account in making command decisions. This involves the gathering of psychological warfare intelligence, including information on the political and psychological effects of tactics and weapons systems.

At present, it is a rare American political or military leader who consciously considers psychological implications when making command decisions. Possibly this failing is due to the fact that it is a rare intelligence officer (civil or military) who looks for or adequately reports intelligence of the type needed in psychological warfare

²¹Linebarger, op. cit., p. 150 f.

operations. It is certainly due, in part, to a national indisposition towards psychological operations. Irrespective of the reason, the need for more and better psychological warfare intelligence is great. To be effective, psychological warfare demands valid measurements of the motivational forces affecting groups whose behavior and thinking it is wished to influence. Accurate data must be available on current attitudes, interests, and beliefs of target populations. It is imperative to know what information and misinformation they possess, the source of information they trust, the concepts they hold, and the values they seek to realize.

X. MORAL AND TRADITIONAL OBJECTIONS

The world is governed in accordance with political customs, ideas, and structures that developed long ago. Psychological warfare is in one sense reactionary, because it goes behind the target state and appeals to the individual as a member of the human community. The greater the success of psychological warfare in inducing treason, the more humane it is as a weapon. Nevertheless, there are unpleasant and immoral overtones in the use of psychological warfare. In the hands of the wrong persons, it is capable of being converted into a drastic instrument of domestic confusion. On a broader, international scale, "warfare psychologically waged" by a total state against a free one can be a vile and

effective instrument, achieving victories by exploiting the peacefulness, indecision, and disunity of its victim. The most powerful countermeasure to hostile, prebelligerent attack is high national morale, which, in turn, depends upon the mental, emotional, and physical health of the people.

Apart from the opinion that propaganda is a form of deceit, and thus immoral, specialists often regard other instruments of policy--diplomacy, armaments, economic measures--as both more respectable and more effective. By tradition and experience, Foreign Service officials are inclined to observe the time-honored ways of communicating with their peers in other capitals and to view communications to people at large as either wasteful or dangerous. Indeed, no degree of righteousness and veracity in mass propaganda can alter the fact that propagandist aims are often subversive.

XI. PSYCHOLOGICAL WARFARE AS AN INSTRUMENT OF POLICY

Psychological warfare is only an instrument of policy, not a policy itself. There are certain things it can do, others it cannot do. It cannot, in the long run, perpetuate falsehoods. It cannot impose an alien system of values on one that already exists. It cannot satisfy physical needs or permanently substitute words for deeds. Where used in

connection with a political or military policy, it can give life and impetus to political goals, it can encourage friends and discourage enemies; militarily, it can confuse and undermine the enemy, damage his morale, and put him on the defensive. It can do much to dishearten the enemy's allies and to win over neutrals. Properly used, and always in coordination with a policy of action, it can neutralize the potentially hostile or wavering. The policies and particularly the acts of a government are the most potent ammunition of psychological warfare; not only is the nature of these acts significant, but, equally significant are the wording of their announcement and the time of its release.

Psychological warfare is but the impact, in the realm of ideas, of the political, economic, and military policies it seeks to support. It is the ideological expression and projection of the objectives and methods of these policies. From the nature and character of these policies, it draws its strength. With them, it triumphs or fails. If it is to be effective, it must be coupled with political and military policies that have the makings of victory. Deeds speak much louder than words.²²

In the sphere of political action, there is no such

²²Hans J. Morgenthau, In Defense of the National Interest (New York: Alfred A. Knopf, 1951), pp. 214, 216, and 219-220.

thing as one and the same truth for everyone. Different people will each consider the same news item, the same idea, from their own particular philosophic, moral, and political perspective. Each will see the idea in a different color and interpret it differently.

Propaganda cannot assume that the sender has the whole truth and the only truth and disregard the basic interests and outlook of the foreign audience. Ignoring the audience's expectations may lead to propaganda boomerangs. Even the most truthful statement can return "home to roost" if it is not attuned to the range of the audience's beliefs and experiences.

XII. PSYCHOLOGICAL WARFARE AND DEMOCRACY

Psychological warfare subordinated to satisfying the home public is not psychological warfare. One of the greatest difficulties encountered in establishing a psychological warfare program is the failure, at all levels, by officials to recognize the totality of effort required. Every act of a nation has either good or bad psychological implications. For all representatives to have the desired unity of purpose, every agency of the government, every newspaper and magazine must be oriented to give the same view. This requires an indoctrination of officials, a degree of policy guidance,

the interest in the subject.

It is not difficult to see why the company's policy
toward the world market is to expand and to grow.
The company's expansion in 1945 is a significant example.
The company has a policy of expansion and growth.
The company has a policy of expansion and growth.
The company has a policy of expansion and growth.

1. The first step in the process of developing a policy is to identify the problem. This is done by gathering information about the problem and its causes. The information is then analyzed to determine the scope of the problem and the potential solutions. The next step is to develop a plan of action. This involves setting goals and objectives, identifying the resources needed, and determining the steps that need to be taken. The plan is then implemented, and the results are monitored and evaluated. If necessary, the plan is revised and the process is repeated.

and a level of internal control which is generally unavailable in a democratic nation.

The character of psychological warfare as a policy instrument derives from the social structure of the nation whose policies it serves. The conditions of its communications industry will determine the number and kinds of channels available for propaganda. The national educational system will determine the personnel available--their number and quality. The values, goals, and aspirations of the nation will condition the policies that psychological warfare will be designed to serve.²³

Psychological warfare is an instrument of foreign policy: it always has been; for psychology and propaganda are necessary in peace and in war in the pursuit of national goals. Some critics claim that propaganda, psychological operations, and psychological war are antithetical to a democratic way of life. So is war; yet democracy has waged just and honorable wars, and democracy has repeatedly used psychological warfare and propaganda in the conduct of its wars and foreign affairs. To deny the state an effective tool in the international field on the grounds that it is not correct practice in "peacetime" to influence a nation's own people, its friends, the neutrals, the enslaved, and the

conquerors through psychological operations is a moralistic bit of nonsense left over from the era of the Light Brigade. Within those limits imposed by national values, the rules of the Marquis of Queensberry must be laid gently, but firmly, to rest.

CHAPTER II

THE FACTORS OF HERITAGE AND IDEOLOGY

I. THE SOVIET UNION

The roots of Russian civilization go deep into the ancient Indo-European background which is common to all European nations. Like all modern peoples, the Russians have acquired a certain admixture of alien blood through the centuries. The Varangians (Norsemen) swept through the land in the eighth and ninth centuries A.D.; and both before and after this period, the eastern Slavs mixed freely with peoples of the Ural-Altaic family--Mongols, Turks, and Finns. Yet, the Russians remained essentially a Slavonic people and did not differ appreciably from such other Indo-European peoples outside of the Mediterranean area as the Germans and the Balts.¹

The ancient Russian civilization profited greatly from intercourse with the Iranians--also an Indo-European strain--who, in those early days, were firmly established on the south Russian steppes. Slavic mythology, folklore, and heroic songs show wide and unmistakable evidence of this

¹George Vernadsky, A History of Russia (fifth revised edition; New Haven: Yale University Press, 1961), pp. 1-19.

influence. Thus, a combination of original Slavic and related Iranian elements underlies Russian civilization.

The Effect of Byzantine Christianity

In the course of the ninth and tenth centuries A.D., Russia was officially converted to Christianity in its Byzantine form. This conversion was of tremendous importance for the whole subsequent course of Russian intellectual and cultural history. Although this conversion laid the basis for a closer relation between Europe and Eurasia, the potential unifying force was greatly inhibited by the eleventh-century breach between the Roman and Byzantine churches. This tended to turn the Russian people inward and laid an early basis of separation between Russia and the West. The constant military pressure exerted by the Poles, Germans, and Swedes against Russia's borders further widened the separation.

The Impact of the Mongols

Across the great sweep of Eurasia, from time immemorial, had surged waves of conquering nomads, each tribe forcing its predecessor onward as inexorably as the pressure of the next outpouring mounted against it in turn. Scythians, Sarmatians, Huns, Avars, and Khazars followed in historic procession, leaving an indelible heritage of fear, conquest, and oppression. Yet, during this long, continuing

assault, the Russian principalities grew, developing a political organization which combined elements of monarchical, aristocratic, and democratic forms of government.² These three elements of power appeared in varying degrees of importance from place to place. Even the Suzdalian monarchy--the nucleus of the future tsardom of Moscow--where the monarchical element had particularly developed was a constitutional monarchy and not absolute. As late as the thirteenth century, Russian political institutions were based upon a free society. The knell to this evolutionary process was struck in the year 1223 A.D. when the Mongols first emerged from the wastes of Northern Persia and Transcaucasia and penetrated the south Russian steppes.

Historically speaking, the Mongol invasion was the last great drive of the Eurasian nomads to the West. The Mongol's intention was "to establish a world empire under which international peace, the pax mongolica, would be achieved."³ The full fury of their assault was not exerted for another fourteen years; but when it finally struck in December of 1237, it carried all before it. By 1241, Russia had been overrun and for the next two hundred and forty years, she lay under the Mongol yoke.

²Ibid., pp. 47-56.

³Ibid., p. 58.

... result, the Russian political system, according to
 political organization which combined elements of monarch-
 cal autocracy, and democratic form of government.¹
 These three elements of power appeared in various degrees of
 importance from time to time. When the Russian monarch-
 the nucleus of the Russian system of power—where the main
 political element and particularly developed was a monarch-
 ical monarchy and not a republic. As late as the Russian
 century, Russian political institutions were based upon a
 royal society. The result of this development is well the
 shown in the year 1917, when the Russian state passed
 from the basis of monarch-ism and autocracy to
 democratic form, which is the basis of the Russian system.
 Historically speaking, the Russian monarch was the
 last great ruler of the Russian people in the past. The
 Russian revolution was the occasion of a new system which
 which international power, now and democratic, would be
 achieved.² The full story of this revolution was not written
 for another thousand years; but when it finally comes to
 December 25, 1917, it marked the end of the old Russian
 had been overthrown and the new one founded and built
 upon, and the world the Russian system.

¹ Ibid., p. 18-19.

² Ibid., p. 18-19.

Mongol rule left many indelible traces in Russian life. City crafts and population declined, while agriculture continued to expand. It was in the Mongol period that Russia became a predominantly agrarian country.⁴

Politically, the decline of the cities meant the weakening and eventual destruction of the democratic element in the old Russian system. While the prince was completely subordinated to the Khan, the Khan's patent now protected him against the political claims of either the townspeople or the boyars. Thus, the very nature of princely authority began to change. As the Khans delegated an increasing number of administrative duties to the princes, particularly the responsibility of collecting taxes, these rulers were able to use, for their own benefit, the administrative and military machine built up in Russia by the Mongols. The Russian princes emerged from the Mongol period much stronger rulers than had been their predecessors before the conquest.

Of great importance was the psychological conditioning process through which the population passed. The people were trained by the Mongols to accept orders unquestioningly, to pay taxes, and to supply manpower without delay. They were subjected to brutal and immediate punishment for any manifest objections. This change in attitude gradually

⁴Ibid., p. 78.

resulted in a new concept of state and society. The old, free political institutions were replaced by the authority of the Grand Duke. The free society was gradually transformed into a network of social classes bound to state service.

Another important source of influence on Russian heritage lay in the development of the power of the church. Under the protection of a charter of immunity granted by the Khan, Manger-Temir, the church became less dependent upon princely power than in any other period of Russian history. Furthermore, it was in the Mongol period that the rural population was Christianized.

Effects from the Fall of Constantinople, 1453

As a branch of the Byzantine Church, the Russian Church was deeply affected by the grave political and religious crisis which developed in the old Near East between 1350 and 1450. Though Orthodoxy was restored by the Turks in Constantinople following its capture in 1453, the political and psychological conditions inherent in the See of the Patriarch's being in the camp of the infidels forced the Russian Church into self government.⁵ It was, thereafter, a natural progression for the Byzantine doctrine of the

⁵Ibid., p. 83.

formed into a network of social classes based on their
of the social order. The two leading and generally known
these political structures were explained by the tendency
consisted in a new concept of class and society. The old

symphony of church and state--the concept of Byzantium as the Second Rome--to be adapted to the Russian milieu. Thus, Moscow became the Third Rome--the last Rome; there would be no other. There was also to develop a near mystic conception of purpose: a deep, emotional sense of defending the faith; and, eventually, the concept of caesero-papism which vested in the Tsar the spiritual as well as temporal leadership of the state.

The Effect of Europeanization

The Europeanization of Russia brought with it new political, religious, and social ideas. It also brought profound internal conflict and a crisis of national psychology.⁶ The new ideas reached the governing and upper classes and were absorbed by them before they reached the masses. Consequently, a split developed between the top and the bottom of society which was never bridged.

Peter the Great accomplished this political emergence at a great price. In the course of his program of westernizing the state, the people were deprived of political power and local government was abrogated. The Orthodox Church, the chief psychological basis of the old Russian state, was subordinated to the civil power and thereafter continually

⁶Ibid., p. 148.

lost influence to such a degree that it faced a threat of disintegration in 1917.

The majority of the people resisted the program of Europeanization, and their inherent suspicion and distrust of the West was further heightened by the forceful imposition of the reforms. Peter's "primary concern was the good, not exactly of the Russian people, but rather of the Russian state."⁷ He stopped at nothing in pursuing the interest of the state. His concept of absolutism, as a part of Russian heritage, was to become habitual and traditional.

Familiar Traits

The reports of foreign observers on the status of affairs in those early days have a prophetic tinge and, in retrospect, seem to presage the conflict of these times. Traits were then becoming visible that were destined later to play an important part in the psychological composition of Soviet power. There was a tendency to a messianic concept of Russia's role in history; an intolerance of foreign outlooks and values; a pronounced xenophobia on the part of Russian officialdom; an insistence on isolating the Russian people from foreign contact; a secretiveness and deviousness of diplomatic practice; a seeming inability to understand

⁷Ibid., p. 151.

anything in the nature of a permanently peaceful and equal relationship between states; a tendency to view every treaty of peace as being in the nature of a provisional armistice; and a tendency to think of conflict as the normal--peace as the provisional and abnormal.

The Role of Ideology

Prophetic as these historic Russian traits may be, it was the linking, by means of a doctrinaire ideology, of a totalitarian party system and national power aspirations which has effectively produced that mutation known as the "cold war." This ideology is woven through the organization of the Communist Party system and interacts with the power considerations of a large block of nations. Therefore, in examining the predilections of the Soviet Union to the use of psychological warfare and psychological operations, it is necessary to examine this ideology for its contribution.

The Contribution of Karl Marx

Karl Marx deriving his concepts from Feuerbach and Hegel combined the materialism of the former with the historical concepts of the latter.⁸ "Historical materialism"

⁸Gerhart Niemeyer, "The Ideological Core of Communism," American Strategy for the Nuclear Age, Walter F. Hahn and John C. Neff (eds.) (Garden City: Doubleday and Co., Inc., 1960), p. 56.

anything in the nature of a governmentally sponsored and equal
 relationship between himself a community on the one hand and
 of power or being in the nature of a personal relationship
 and a tendency to think of himself as the master—power is
 the traditional and abnormal.

THE WAY OF IDEALISM

Proposed as they might be, these things may not be
 the thing, by way of a personal relationship, of a
 totalitarian party system, or national power relations
 which has effectively rendered that system known as the
 "cold war". This tendency to view things as organizations
 of the Communist Party system and relations with the power
 construction of a large class of nations. Therefore, in
 extending the boundaries of the world to the new
 of psychological systems and psychological systems, it is
 necessary to consider the following:

THE CONCEPT OF THE STATE

That this concept has brought into question and
 been confined to the question of the state with the aim
 of the concept of the state, the concept of the state.

¹Edward A. Shils, "The Intellectual Life of Democracy,"
 American Quarterly, Vol. 1, No. 1, Spring 1949, pp. 1-10.
 John C. Hall, "The Intellectual Life of Democracy,"
 1950, p. 10.

was the derivative: the idea that history occurs because of changes in material, economic conditions which, in turn, lead to changes in human existence and which proceed according to an inescapable logic.

From this derivative, it develops that: (1) life is fundamentally a relation between man and matter (out of this relationship issues a communist's certainty that his beliefs are corroborated by scientific proof); (2) the laws of history can be scientifically determined and the Marxist interpretation is the only "scientific" key to the knowledge of history; (3) one can find general truth about human affairs only by participating in historic change--the point of philosophy is not to interpret but actively to change the world. Out of this purpose, revolutionary activity as a way of life becomes apparent.

The core of the communist teaching about society is the doctrine that all societies above the primitive level are split into classes. These classes are locked in an unceasing and irreconcilable struggle. Thus, struggle is not an abnormal condition, but rather the characteristic trait of all historically recorded societies. In modern society, this struggle has narrowed to a conflict between the bourgeoisie, who are those who produce commodities through hired wage-labor, and the proletariat, who are the propertyless wage workers. In this social conflict, power is

interpreted, basically, as the rule of one class over another.

According to communist theory, it is private ownership of the means of production which enables a class to rule. Since the proletariat possesses no means of production, being without property, its victory in the class struggle cannot result in another class rule.

The revolution of the proletariat is, therefore, expected to end all class rule and to inaugurate a new type of society in which there will be no classes, no exploitation, and no need for political power--socialist society.⁹

Communist doctrine holds that all societies pass through successive phases of development--primitive, slaveholding, feudal, bourgeois, and, finally, socialist.¹⁰ In the course of this development, the class struggle has fastened itself upon mankind as a result of the institution of private property, for it is private ownership of the means of production which enables a class to rule and wealth can be generated only at the price of poverty. Classes, then, developed a machinery for oppression--the state. Only when human society is free of class rule, will mankind be relieved of these plagues.

In Karl Marx's view, the capitalists exploit the people for profit and rule all men in bourgeois society.

⁹Ibid., p. 59.

¹⁰Ibid., pp. 54-60, passim.

unpleasant, possibly, as the fact of the great number
another.

According to the present theory, the great number
of the means of production which enables a man to
rule, since the production process is based on power,
and, being without power, is weak, in the class
struggle must result in another class rule.

The revolution of the proletariat is, therefore,
aimed at the abolition of the capitalist system
and the establishment of a new system which will be based
on socialism, not on the capitalist system.
Socialist society.

According to the present theory, the great number
of the means of production which enables a man to
rule, since the production process is based on power,
and, being without power, is weak, in the class
struggle must result in another class rule.
The revolution of the proletariat is, therefore,

Socialist society.

In the present system, the capitalist class
owns the means of production and the workers are
exploited.

The revolution of the proletariat is, therefore,
aimed at the abolition of the capitalist system
and the establishment of a new system which will be based
on socialism, not on the capitalist system.
Socialist society.

This system is inherently evil and must be destroyed in its entirety. It also is shot through with inherent contradictions and thus bears the seeds of its own destruction and overthrow by the proletariat. Thus, Marx left to Lenin a target for hostility, a motive for irreconcilable hatred of the world's society, and the prediction of a catastrophic but hopeful end.

Lenin's Adaptations

With the legacy of Marx, developed in his Capital, as bedrock, Lenin proceeded to transform these teachings into the basic Bolshevik doctrine of the Communist Party of the Soviet Union.

To Lenin, capitalism had advanced from the competitive to the monopolistic and imperialistic stage. This was the final stage, and the capitalist nations could now be expected to turn on each other in mutually destructive wars. The world was, therefore, to be the scene of a final, titanic conflict between the industrial nations on one hand and the socialist and anti-imperialist states on the other. The latter group comprised the "overwhelming majority," according to Lenin, and was, thereby, given a kind of democratic justification.

The struggle was now to be a world-wide conflict between two international "camps" and was, in addition to a contest between the revolutionary forces and capitalism,

This system is essentially self-sufficient in the
 activity. It also is not through with its own
 time and also bears the same to the new generation and
 overflows by the generation. Then, there is the same
 target for activity, a service for its own activity
 the world's activity and the condition of a relationship
 but beyond that.

Technical Analysis

With the system of law, movement is the subject, as
 object, which is subject to movement and movement into
 the state of activity. In the technical sense of the
 system.

In technical analysis and activity is the subject-
 five to the subject and technical sense. This was
 the final stage, and the technical sense would be
 expected to rise to some extent in activity, technical sense.
 The world was technical, in the sense of a final,

technical sense, because the technical sense is the
 and the technical and self-technical sense of the object.
 The latter sense would be the technical sense.
 according to law, and the technical, given a sense of law-
 system technical.

The technical sense of the technical sense is
 given the technical sense, and the technical sense is a
 contrast between the technical sense and technical.

also a struggle against war. In this manner, world politics and revolutionary cause were to be woven into a single fabric.¹¹

Marxism-Leninism thus postulated a struggle of the future against the present--the Socialist Revolution or, simply, "the Revolution." It summoned all "toilers," under the unifying leadership of the Communist Party, to fight the revolutionary struggle to bring about the inevitable end of present day capitalist society. Any method required to bring to pass the catastrophic destruction of this bourgeois society was to be justified in the name of the hoped-for result. Deliberate action and political organization would be necessary to accomplish the deed, and no sacrifices could be deemed excessive in the struggle for victory.

While he borrowed heavily from Marx to formulate his views on "the Revolution," the basic operational doctrine for implementation of the revolution was shaped entirely by Lenin.¹²

We live not only in a state, but in a system of states and the existence of the Soviet Republic side by side with the imperialist states for a long time is unthinkable. In the end, either one or the other will conquer. And until that end comes, a series of the most terrible collisions between the Soviet Republic and bourgeois states is inevitable.¹³

¹¹Ibid., p. 63. ¹²Ibid., pp. 64-69, passim.

¹³Vladimir Ilyich Lenin, Selected Works (New York: International Publishers, 1935), p. 107.

Hence, the struggle would continue with undiminished fury against external enemies long after the communists had seized power and dealt with their internal foes. Marx's concept of a single upheaval was now transmuted into a "protracted struggle" in which the Communist Party, Communist strategy, the role of the state, and the place of the Soviet Union all had doctrinal functions to perform.

The Role of the Party

The Party was defined as the "vanguard" of the proletariat, and was entrusted with guarding and developing revolutionary theory. It was, therefore, implicitly the judge of the correctness of all thought. Its members would be comparatively few in number and dedicated to the profession of revolution.

Lenin developed a number of strategic principles most of which proposed methods by which a small, compact organization could use revolutions made by others to control large-scale revolutionary movements and change. The use of alliances, neutralization, legal as well as illegal activities, and bourgeois revolutions which were later to be subverted are all examples of basic tactics.

The road to a society of full freedom when the state has withered away leads through the dictatorship of the proletariat. Therefore, until the long-awaited day when there

is "nothing any more to suppress," the state is to be used dictatorially, not as an instrument of the common good but for combat operations of the Party as a "rule based upon force and unlimited by law."¹⁴

The Role of the Soviet Union

The Soviet Union was assigned the role of the power base for the world revolutions. Here, the Party could consolidate its power; and Soviet Russia, therefore, became a chief instrument of the world revolution, and the Communist International became the tool of Soviet Russia. "Henceforth, the national power, national security, and national expansion of the Soviet Union came to be intertwined with communism as an ideological cause."¹⁵

Any agreements between the Party and outside groups must be regarded as aiding the future liquidation of these groups and as barriers against the liquidation of the Party by them. Therefore there is no essential difference between coming to an ostensibly amicable agreement with an outside group or using violence against it; they are both tactics in an overall strategy of attack.¹⁶

Bolshevik Combat Philosophy and the Place of Psychological Operations

Therefore, there is no place in the Marxist-Leninist

¹⁴Cited by Niemeyer, op. cit., p. 67.

¹⁵Ibid., p. 68.

¹⁶Nathan Leites, The Operational Code of the Politburo (Santa Monica: The Rand Corp., 1950), p. 62.

outlook for genuine compromise or coexistence or for any reconciliation of differences. The struggle against the capitalist enemy is the law of life. To end it, even to interrupt it, would be to die. Once an opportunity arises, action--immediate action--is the only permissible course. "History," said Lenin, "will not forgive revolutionaries for procrastination when they can be victorious today . . . , while they risk losing much, in fact, everything tomorrow."¹⁷

Struggle, consequently, must remain the key to Soviet tactical and strategic thinking. Relaxation, "normalcy" in the conduct of relations with others, peace, as the West understands the term, are by definition incompatible with what the Soviet leaders avow to be their solemn obligation to history. The contest, they themselves insist, must be to the death.

From its earliest days, communist conflict doctrine has revealed a remarkable affinity to military thought. The pith of communist doctrine is the concept that military and political instruments are interchangeable in the execution of one vast strategic plan.¹⁸ War, be it fought with

¹⁷Lenin, op. cit., p. 237.

¹⁸Alvin J. Cottrell and James E. Doughety, "The Larger Strategic Vision," American Strategy for the Nuclear Age, Walter F. Hahn and John C. Neff (eds.) (Garden City: Doubleday and Co., Inc., 1960), p. 56.

military hardware or through non-violent, political, and psychological operations, is a unity. "Hot" and "cold" are but degrees of intensity in one and the same war.

According to standard communist procedure, the pre-dominant enemy group should not be attacked in a decisive manner before its leaders and cadres have become unsure of their capabilities, intentions, rights, and, above all, of their chances of success. This doctrine firmly establishes the operational requirement for psychological warfare and psychological operations as a tool of Soviet foreign policy. Since foreign policy is conceived within the parameters of a nation's values as they have developed out of heritage and ideology, it follows that the Soviet conduct of psychological operations would be in accordance with Bolshevik conflict doctrine. Since war, politics, diplomacy, law, science, economics, and psychology all form a continuum and are closely integrated in the conduct of Soviet foreign policy, psychological operations can be encountered in every act of the Soviet Union. Soviet National Security policy marinates military, foreign, and domestic policies in a vehicle of psychological operations. No action is taken without consideration of its psychological impact upon the entire spectrum of short and long range objectives.

ability depends on three main factors: (1) the
 experimental conditions, (2) the subject's
 and degree of interest, (3) the test itself.

According to the second component, the test

described above should not be taken as a test of

memory, but the subject's memory may be tested in

other conditions. In addition, it is not all of

the memory of the subject, but only the memory

the subject has at the time of the test, and

experimental conditions are of great importance in

such cases. It is not all of the memory of a

subject's memory at any one time, but only the

memory at the time of the test, and only the

memory of the subject at the time of the test.

There is, of course, a great deal of memory, but only

memory at the time of the test, and only the

memory of the subject at the time of the test.

There is, of course, a great deal of memory, but only

memory at the time of the test, and only the

memory of the subject at the time of the test.

There is, of course, a great deal of memory, but only

memory at the time of the test, and only the

memory of the subject at the time of the test.

II. THE UNITED STATES

Since the remote ages of pre-history, the land had been there, shielded behind the heaving, restless barriers of the North Atlantic and North Pacific oceans and the swirling sea mists. Perhaps as long ago as 50,000 B.C.¹⁹ man had reached its shores. Kin of the same nomads who periodically welled up out of the depths of Eurasia and surged into the European peninsula, Asiatic migrants crossed the land bridge between Siberia and Alaska. Driven by cold, searching for more game, questing for an easier life, these migrants gradually dispersed through the entire landmass from the Bering Strait to Tierra Del Fuego.

These early arrivals from Asia brought with them a primitive Stone Age culture and knowledge of the use of fire. In time, some of them learned how to work metal; others never advanced beyond stone weapons and tools. In the jungles of Central America, the Valley of Mexico, and the Peruvian highlands, great civilizations comparable to those of the Mediterranean and Western Europe flowered.

No such empires were developed in the vast, near empty sweep of land that would, one day, become the United States and Canada. Here, by the end of the fifteenth century,

¹⁹Richard B. Morris, The New World (New York: Time Inc., 1963), p. 9.

the Indian population numbered no more than a million. These people were split into a large number of tribes marked by the utmost diversity and fragmentation. They did not look alike, speak alike, live alike, or even pray alike. Their weapons and tools were primitive, and they possessed an ineffective political organization. Psychologically, most of them could not unite, which placed them at a great disadvantage when faced by an organized invader. The geography of their land placed them at an additional disadvantage. The coast line provided innumerable attractive sites for initial settlement, while the network of lakes and rivers provided strategic highways of penetration. Only the North Atlantic Ocean protected the seemingly fixed and unalterable patterns of the Indian's way of life.

The first coming of the European was an historical accident which yielded no enduring results, exerted no influence, and for centuries was all but forgotten.²⁰ The Norseman, Leif (the Lucky) Ericsson, sailed from Norway in the year 1000 A.D. to bring the Christian faith to his pagan homeland in Greenland. En route, he was struck by a violent North Atlantic gale which set him far to the southward. When he raised the land, it was an unknown shore. This was the New World--Vineland, Leif called it.

²⁰Ibid., p. 11.

Leif sailed away to be followed by one Thorfinn Karlsefnei, a trader, who pursued a colonizing enterprise. The venture was ill-fated and, largely because of the violent contact with a strange and hostile people, he withdrew after three years of terror and combat. For almost another five hundred years the North Atlantic remained unconquered.

The New World

From first light on the morning of October 12, 1492, dates the impact of the New World on the course of history. The Americas now lay before Europe. Spain, with her armed forces freed for the first time in seven hundred years from conflict with the Moors, immediately poured her captains and adventurers into the Western Hemisphere, bent on conquest and the search for gold. France and Britain joined in the early explorations, but while the Spaniards exploited the Americas for precious metals, the French and English amassed less glamorous wealth and developed thriving fishing and fur industries, thus laying the basis for a commercial colonization.

The Results of the Defeat of the Spanish Armada

Following the defeat of the Spanish Armada in 1588, the pace and scope of English expansion into the New World burgeoned. On the eve of that great naval engagement, Philip II of Spain ruled all of the permanent European

settlements in the New World. A century later, the English were entrenched along the North Atlantic coast from Maine to the Carolinas, as well as in the Caribbean. Much of North America was already lost to Spain.

Had British sea power been defeated in the Channel, the character of North America would have, without doubt, developed along entirely different lines. Its culture would have been Latin, its religion Catholic, its native races would have been exploited rather than ejected or exterminated, and its precepts of government and political stability would have been in the Hispanic-colonial style rather than in the Anglo-American traditions of constitutional rights, representative government, and civil liberties.

Emergence of the American

And those who came were resolved to be Englishmen,
Gone to the World's end, but English every one,
And they ate the white corn-kernels, parched in the sun,
And they knew it not, but they'd not be English again.²¹

Many of the emigrants were farmers seeking cheap or free land. There were weavers, tradesmen, laborers. There were vagrants, bound men and women, pickpockets, convicts, paupers, and prostitutes. Some sought to escape the degradation and hopelessness that had been their lot in the father land. Others sought a freedom of worship not granted

²¹Stephen Vincent Benet, Western Star (New York: Fanar and Rinehart, Inc., 1943), p. 116.

settlements in the new world, a century later, the British
were confronted with the North American continent from which to
the continent, as well as in the continent, each of which
America was already 150 years old.

Had Britain not been so concerned in the continent,
the character of North America would have been different,
developed along entirely different lines. The entire world
have been seen, its religious, its native races
would have been subjected to the same degree of uniformity
needed, and its people as to government and political structure
would have been in the same manner as in the rest of the world
in the North American continent of North American origin,
representative government, and civil liberties.

Importance of the North

And there are many more things to be said,
there is the North's great, and British there too,
and they are the same everywhere, known in the
and they have it all, and they have it all in the North.
Many of the English have found a new home in
five years. Their first homes, wherever they go, they
were made, and they are now, everywhere, everywhere,
people, and people, from people to people the same
action and development all the time, and all the
other land. There is a great deal of work to be done

to them in the old country. But no matter their reason for leaving Europe, they all sought a freedom and a liberty that was not available to them in the Old World. Some gave up home; all gave up country; all faced a savage, wild, primeval wilderness. No one can gainsay their collective bravery.

Despite the conditions at home which led the emigrants to sail for the New World, England occupied a position of deep regard in the hearts of the early colonists; and it was natural that they attempted to reproduce, in the wilderness, the institutions of government as they remembered them at home. Yet, the very threat and challenge of the wilderness compounded by the vast problem of communications forced the mutation and evolution of the transplanted political institutions to commence almost as soon as the first crude settlement was laid out. The New World was isolated, and autonomous action was necessary for survival. Any arrangements between the Crown and the Colonies which inhibited the action necessary for the physical, economic, or political survival and well being--as the Colonist saw these factors--would be and was intolerable. The roots of the American tradition of Isolationism can be found in this early demand for freedom of action and the necessity, later grown to a felt preference, to rely chiefly on one's own strength and resources for colonial survival.

to them in the old country. But at present their hands are
leaving things. They are doing a business and a library that
was not available to them in the old world. Some have to
now, all have up country; all have a library, with, I think
all libraries. So the new primary school children are better
equipped and educated at home than in the new
world. It will be all for the new world, England occupied a position
from its deep roots in the world in the early centuries
and it was natural that they returned to England, to the
wilderness, the wilderness of government as they know
better than at home. For the new world and challenge of
the wilderness demanded of the new people of the wilderness
from today the education and evolution of the wilderness
political institutions to common sense as long as the
first class institutions are left out. The new world was
created, and autonomous politics was necessary for survival.
Any arrangements between the new and the old world were
maintained the nation necessary for the political system, in
political survival and well-being—the old world the new
world—would be and was inevitable. The new world was
born from the evolution of civilization and in order to survive
early demand for the evolution of culture and the economy, their
growth to a high civilization, to help society in order to
survive and flourish for political survival.

The Crown ruled the colonies in a paradoxical manner.²²

While granting home rule to the Colonists, it waged a constant campaign to prevent their ruling. The Empire counted upon the loyalty of the Colonies yet appeared not to trust them to remain loyal. While the Colonists were regarded as English citizens, they were, at the same time, denied many of the basic rights of Englishmen. The colonies were required to assume a share of the burden of empire and simultaneously denied a serious voice in the imperial decision-making process. The fleet effectively protected the Colonies from foreign attack to such an extent that the Empire considered it much less necessary to provide troop protection for the Colonials.

It was difficult to tell at just what point the colonists ceased to be loyal English subjects outraged over taxes and repressive measures imposed from abroad. Perhaps one third remained loyal. But gradually others, at first a few, then in ever-increasing numbers turned to the idea of liberty. King George III's American subjects had ever been quick to defend their ancient English liberties; his English subjects had let theirs erode.²³

²²Morris, op. cit., p. 143.

²³Ibid., p. 156.

The American Revolution

The American Revolution, which developed gradually from a series of political skirmishes for the defense of colonial rights, finally exploded into a full-scale war for political independence, unleashing pent-up demands for political and social reform. The Americans carried into the conflict a deep concern for, and emphatic stress upon, legality. They fought for the rights they believed were guaranteed them as Englishmen under the British constitution and for the rights of man as they understood them to be derived from the "Laws of Nature and of Nature's God." This sense of community, achieved through an explicit commitment to particular concepts of social and political organization, was later to be reenforced by a growing nationalism. The resulting compound defines one of the basic elements of American experience and heritage, and it continues to shape American values.

The Declaration of Independence with its affirmation of the natural rights of life, liberty, and the pursuit of happiness would become the conscience of the American people, reminding them of standards by which to judge the conduct of their national life. When Jefferson wrote into the Declaration the natural right of the individual to the pursuit of happiness, he was providing a theoretical base for an experience in the open-class system already a century and a

The American Revolution

The American Revolution, which developed gradually from a series of political actions for the defense of colonial rights, finally resulted in a full-scale war for political independence, ultimately leading to the political and social reforms. The American people, who had been a long time in the process of developing a sense of self, were now ready to fight for their rights. They fought for the right to be treated as equals with the British, and for the right to have a say in their own government. This led to the creation of a new form of government, one that was based on the principles of liberty and justice for all. The American Revolution was a turning point in the history of the world, and it led to the creation of a new nation, one that was based on the principles of liberty and justice for all. The American Revolution was a great achievement, and it led to the creation of a new nation, one that was based on the principles of liberty and justice for all.

The American Revolution was a turning point in the history of the world, and it led to the creation of a new nation, one that was based on the principles of liberty and justice for all. The American Revolution was a great achievement, and it led to the creation of a new nation, one that was based on the principles of liberty and justice for all. The American Revolution was a turning point in the history of the world, and it led to the creation of a new nation, one that was based on the principles of liberty and justice for all. The American Revolution was a great achievement, and it led to the creation of a new nation, one that was based on the principles of liberty and justice for all.

half old. A man could aspire to heights limited only by his ability, and he could enjoy acceptance by his fellows on the basis of his character and his accomplishments. The idea and reality of the open-class system was one of the most important contributions of the Americans to the social thinking of Western civilization.

The successful conclusion of the Revolution resulted in the throwing off of the English allegiance--the rejection of the only embodied authority which was generally recognized. It was not, at the time, the replacement of one authority by another. The birth of the American Republic was marked by the rejection of authority as such: authority was coercive, arbitrary, despotic, morally wrong.

For eleven years the thirteen independent Colonies pursued widely diverse paths. The almost complete bankruptcy to which this near anarchy brought the Confederation demonstrated that it was impossible for them to survive without some sort of central authority.

The Advent of the Constitution

All hope for the future of America was centered in the Philadelphia convention which opened in May of 1787. The remarkable document which was produced created a federal structure that endowed the national government with both power and energy. It reflected the American suspicion of authority and the dedication to freedom of action through an

ingenious system of checks and balances and the principle of divided powers. Thus, authority was jealously circumscribed by the erection of insuperable legal barriers to the excessive hegemony of one person or group.

The typical American attitudes toward authority have remained substantially the same as those manifested by the framers of the Constitution. Authority must be as circumscribed, diffused, and limited as legal ingenuity can devise, and the holders of these positions should be under constant scrutiny and should be watched as potential enemies.

Washington's Farewell Address

From 1492, American had been involved in the overseas ramifications of every European conflict. Her independence had been gained through the support of France to the extent that Paris assessed the positive net worth of such a military venture in the overall Anglo-French contest. In an attempt to frame American perspective in terms of the Napoleonic Era and the still precarious national position, Washington spoke on a general theme embracing domestic and foreign policy. The shadow of this Farewell Address has lain across the development of American thought ever since. Washington attempted to focus attention on a distinctive course of action for the nation so that its national interest could be related to the world environment in which, perforce, it must exist. He counseled not a hermit land but an American

language system of thought and behavior and the principle of
divided power. Now, although the latter is somewhat
by the creation of separate legal systems for the various
five members of the group of states.
The legal system of the group of states is
remains essentially the same as that established by the
interests of the community. Similarly, there is no dis-
tributed, divided, and divided as legal responsibility and
and the interests of these persons remain the same. The
activity and should be subject to practical control.

Washington's Foreign Policy

From 1911, America has been involved in the system
of relations of very complex nature. The independence
has been gained through the support of the United States
that this system has positive and negative as well as
very active in the world and in the context. In an
attempt to form a new perspective in terms of the
Washington and the still persistent national position,
Washington as a general theme embracing domestic and
foreign policy. The reason for this is that the
state across the development of American thought and
Washington attempted to form a system as a result of
course of action for the nation as this is related to
could be related to the world environment in which, however,
it was not. The domestic and a result of the American

nation, sufficiently strong militarily, to protect itself from a position of maneuver purposely kept free from formal commitments to any nations involved in the European power struggle of the late eighteenth and early nineteenth centuries. This would provide the American people the opportunity to develop their land and destiny free of European destiny. Only in this way could Washington foresee unlimited horizons for the new American commitment to its distinctive set of values in political and social life.

The Westward Movement

The Nation accepted this advice and turned itself to the task of building and consolidating its hold upon the land of North America; and it was a marvelous land--its earth rich, its streams filled with fish. The primeval stand of woodlands stretched to the great plains where the immense, waving buffalo grass prairies, undulating in the wind, whispered and heaved like a sea. Only nature, the aboriginal tribes, and its own internal limitations blocked territorial expansion. For another hundred years, the day-by-day life of America would be directly challenged by the undreamed rich potential of this land, and this century-long steepage in such an environment was also to play a large measure in the molding of American experience and basic values.

Without childishly denying the relevance of the past, can we not recognize that the American past does not, like the past of many other peoples, extend downward into the soil on which we at any moment stand. Our past, by and large, extends laterally backward across the mountains or plains, or across the sea, to somewhere else. Our history is the process of westering and the counter process of return A long, complex, and sometimes rapid sequence of consecutive change. America is not an artifact. It is not a fixed and immutable ideal America is process, and in so far as we are American, the work of our heads and hands and hearts inevitably reflects that fact.²⁴

Their eyes are fixed upon another sight: The American people views its own march across these wilds [and] . . . this magnificent image of themselves does not meet the gaze of the American at intervals only; it may be said to haunt every one of them in his heart as well as his most important actions and to be always flitting before his mind.²⁵

The Westward movement further attenuated America's political ties with Europe; the acquisition of the Louisiana territory and conclusion of the War of 1812 accelerated the process. The power of attraction of this westward movement is to be felt even today in the rich American connotations of the word "frontier." As the American center of gravity moved westward, America's national culture became continually more remote from its European origins.

The frontier became the milieu in which a unique

²⁴John Kouwenhoven, "What is American About America," Colorado Quarterly (June 1956), p. 54.

The evidence is so clear and so overwhelming that it is impossible to doubt the truth of the charges against the man who was charged with the murder of the victim.

American national character was shaped. The man who could solve the urgent, material, day-to-day problems, organize and operate profitably a productive enterprise, and deal effectively with the daily local social and political life rose in status and repute. His operational approach to all matters became the American approach. His faculties, attuned to an assessment of concrete problems, an empirical method of resolution, and a pragmatic solution became the national approach to all problems. It followed naturally that this same national approach, preoccupied with ad hoc solutions to arduous, practical tasks and generally unable to take time for reflective thought, generated a proclivity towards the accumulation of a store of general concepts. As can be the case with empiricism, these general concepts were not always demonstrably related to each other or, for that matter, related to the bodies of fact they were supposed to encompass.

The Religious Input

Religion had ever been present throughout the colonies. Some offered sanctuary to oppressed faiths, some forbade all but their own; generally Protestantism predominated. The Puritans contributed much to the spiritual heritage of the nation. Politically, reaction to Puritanism helped shape early American political parties and contributed

national national character was sought. The aim was to
 give the system, national, day-to-day problems, economic
 and social conditions a revolutionary character, and deal
 effectively with the daily local social and political life
 in the states and regions. The operational approach to all
 national problems was the national approach, the national ap-
 proach to an examination of national problems, the national
 method of examination, and a practical solution based on the
 national approach to all problems. It followed naturally
 that this was national approach, practical approach with an eye
 to the national, practical facts and generally results
 in the time for the national approach, generated a practical
 solution to the examination of a state or general approach. As
 can be seen with practical, these general approaches were
 not always demonstrably related to each other or, for that
 matter, related to the nature of the facts they were supposed to
 encompass.

The National Approach

Religion and other social factors influenced the system.
 First, some efforts were made to spread faith, some
 towards all but their own, generally in the national
 domain. The system contained much in the national
 nature of the nation. Politically, religion in the national
 nature was very much political nature and contained

to the constitutional separation of church and state. However, the Puritan character, diluted in its westward movement, spread throughout the country and is still reflected in the character of modern America in the sense of the moral content of life and in the mixture of practicality and militant zeal for humanitarian causes. It underlies the sense of mission, first carried westward by the settlers and frontiersman, that the Nation created in 1776 exists as a corporate entity not only to further the peace and security of its citizens but to aid--at home and, by example, abroad--the cause of freedom and humane living.

The Nineteenth Century Balance of Power

America was singularly blessed in that fortune granted the young nation, after 1815, a century during which a protracted era of international peace existed. The geographic protection afforded by two large oceans and a British foreign policy, supported by naval power, which found it to be in the Imperial interest to deny the Western Hemisphere to incursions by other European powers, permitted uninterrupted national development. Throughout the greater part of the nineteenth century, therefore, there was no autonomous center of military power, other than the United States, in the Western Hemisphere and, consequently, no immediate threat to its existence. By historical accident, it was to be that

the great theaters of the nineteenth and twentieth century wars would be in Europe, the Mediterranean, and the Far East; for over a hundred years, the European balance of power remained such that no substantial European coalition could likely be brought to bear to threaten the security of the American Republic.

The domestic impact of such fortune seemed to support the Washingtonian policies of non-entanglement in world politics. It would have seemed the height of folly to abandon such a position and willfully become involved in the shifts and realignments of European balance-of-power politics. European disunity and American remoteness, then, acted to protect the United States. Both conditions made alliances superfluous--alliances which would, at best, have reduced America's own security in world politics. Unencumbered, American diplomacy retained a freedom of action within the Western Hemisphere, established a benign reputation among nations and peoples who considered themselves victims of the European balance-of-power system, and permitted a physical and industrial growth to occur which was commonly viewed with indifference rather than with concern by the European powers. Consequently, the continuity of national life seemed to validate the initial cultural, political, and value choices and decisions followed since the time of Washington.

the great element of our civilization and progress, and the
which would be in Europe, the American people, and the
which for our people, the American people, and the
which remained with the American people, and the
which finally we should be able to have the American people

[illegible]

The Immigrants

As the expansion continued, the waves of immigration poured into the Atlantic ports.

Give me your tired, your poor,
Your huddled masses yearning to be free,
The wretched refuse of your teeming shore,
Send these the homeless, tempest-tossed to me.
I hold the lamp before the golden door.²⁶

These new immigrations sustained the widespread belief that America was a refuge from Europe and its discontents. Most of those who came did so voluntarily. Yet, for many of these ethnic groups, particularly the Irish and the East Europeans, cultural assimilation was difficult. In the land of equality, they found themselves considered as social inferiors. Memories of Europe were simultaneously humiliating reminders of their incomplete assimilation into the American culture and society and a source of a comforting ethnic subculture which lessened the loneliness and isolation they felt. The effect of these ethnic tensions was to reenforce the basic concept of neutrality towards the European balance of power.

So long as one's own personal renunciation of Europe coincided with the broader national purposes of America, there was no reason to expect that foreign policy crises would tear apart the seam of American nationalism.²⁷

²⁶ Emma Lazarus, The New Colossus (inscribed on the pedestal of the Statue of Liberty, Bedloe Island, New York).

²⁷ Paul Seabury, Power, Freedom and Diplomacy (New York: Random House, 1963), p. 44.

In this manner, the multi-national background of American society served to enhance the country's isolationist impulses.

Self-Sufficiency

With the opening and exploration of the land, the continent was found to contain most of the natural resources necessary to sustain a constantly enlarging standard of living. The absence of internal tariff barriers and restrictions on interstate commerce opened a gigantic internal market within which industrial and agricultural production could be marketed. Concurrent increase in agricultural productivity rendered the United States virtually self-sufficient in foodstuffs. This set of circumstances was in direct opposition to the European pattern which, in quest of materials, markets, and food, had turned outwards upon the world and thereby increased the relative involvement of these nations in world trade and the international implications of each other's economic policies. In America, the consequences of economic growth were just the opposite and served as yet another source of validation for the chosen national path.

The Developing Pattern of Organization

The industrial and governmental complex expanded with the growth of the nation, and concurrently the matter of organizational attitudes and structure for the operation of

In this respect, the inter-territorial movement of American society seems to be moving towards a more or less complete isolationism.

Self-Sufficiency

With the coming of the war, the isolationist movement has been in a position to maintain most of the national industries necessary to sustain a constantly increasing standard of living. The amount of industrial output and resources

from an industrial country could be a significant

factor within which industrial and agricultural production

could be increased. Cooperation in the agricultural pro-

ductivity has been the United States' primary self-sufficiency

in foodstuffs. This act of discrimination has in other ways

acted on the economic system which, in fact, is a

market, and food, has been a factor in the war and

energy, investment and relative movement of these factors

in world trade and the international relations of each

other's economic policies. In fact, the movement of

economic growth has been the opposite and moved as far

another source of reliance for the modern national plan.

The Economic System of Capitalism

The industrial and governmental system is based on

the growth of the nation, and consequently the growth of

organizational systems and systems for the production of

these organizations received increasing attention. Throughout the developmental process, American politics and industry "relied on the ability of an individualistic society to throw up a succession of innovating leaders."²⁸ The operating code of this American organizational pattern became centered about a planning process which projected into the future the pattern of the familiar on-going processes and trends. The emphasis became one of operating a relatively static process efficiently rather than developing solutions to radically new problems.

American heritage developed out of the individualist society of a pioneering people conquering a new, virgin land. There was no feudal heritage or society and no political past, in the European sense, from which the Americans had to free themselves. The natural concepts and conditions which were taken for granted in the young America had to be bought in blood, if ever achieved, in other lands. Consequently, there has been little in the American heritage would could provide an operational source of experience for the empiric American planning cycle to employ in dealing with the political, social, and economic attitudes and problems of the rest of the world.

²⁸Rostow, op. cit., p. 281.

These organizations received increasing attention and support
 over the developmental process, American politics and business
 lay outside of the ability of an individualized society to
 show up a suggestion of innovative features. The
 operating code of this business organizational pattern
 became essential to a planning process which projected
 into the future the pattern of the earlier working process
 and the future. The business became one of operating a
 relatively static process efficiently rather than developing
 solutions to radically new problems.

Business activities developed out of the individualized
 society as a functioning people cooperation a new, viable form.
 There was no total rupture of society and no political
 break in the business sense. From which the Americans had to
 live themselves. The natural changed and decisions which
 were taken for granted in the young America had to be sought
 in place, it was natural, it was natural. Consequently,
 there has been little in the American mind which would
 provide an operational source of inspiration for the entire
 American planning cycle as today is dealing with the political,
 social, and economic activities and problems of the past
 of the world.

The Pains of Emergence onto the World Stage

America was able to pursue its internal expansion and national interest, the course and nature of which established its national values and heritage, through an unwitting (and occasionally a witting) exploitation of the balance-of-power struggle between the major European states. By the beginning of the twentieth century, this kind of exploitation was no longer sufficient. No longer did the fragmentation of Europe assure America that no single power or power group would dominate Eurasia and thereby simultaneously threaten the security of the United States. No longer did the determination of European national interests correspond, even approximately, with those which defined the Washington policy. American interests now collided with issues considered to be of primary importance to the European powers; no longer could American policies be predicated upon the benign fall-out from major European power clashes. America, henceforward, would be unable to finesse her international way; willy-nilly, the United States would be required to participate on the international political stage.

It is on this international political stage that the United States has performed since 1900. It is not surprising in the light of her past that the performance has been a reluctant, often grudging, one. Some of the instinctive rejection of the position into which Americans have found

themselves pushed since the debut was voiced in the late General Patton's order-of-the-day issued to his troops immediately prior to their amphibious assault on Sicily in July, 1943:

When we land, we will meet German and Italian soldiers whom it is our honor and privilege to attack and destroy. Many of you have in your veins German and Italian blood, but remember that these ancestors of yours so loved freedom that they gave up home and country to cross the ocean in search of liberty. The ancestors of the people we shall kill lacked the courage to make such a sacrifice and continued as slaves.²⁹

A century and a half of insulation from world politics developed traditional American attitudes that will long continue to influence the development of American policy. The uninterrupted decades of national life which produced a continuous growth of wealth, power, and standard of living seem to be irrefutable proof of the worth of the system. The democratic institutions, the relative absence of class conflicts, and the attainments of its multi-national society all seemed to be highly exportable qualities and lent fervor to the definite messianic traits that existed in the liberal traditions of America.

The conquest of the continent was a straightforward military operation. A good Indian was a dead Indian. His heart and scalp, not his mind or eternal soul, were the

²⁹Cited by Geoffrey Gorer, The American People (New York: W. W. Norton and Co., 1948), p. 23.

themselves pushed since the date was noted in the late
 General Gage's order-of-the-day issued to his troops late-
 January 1861 as their anniversary of duty in 1861.

1861:

When we read, we all were drawn and drawn together
 when it is the heart and spirit of the nation and
 history. Many of you have in your own hearts and
 history blood, but we must not let them be divided by
 your so loved blood. That they may be as one and
 history to be one and history to be one and history
 the history of the people we shall all be one and
 history to be one and history to be one and history
 history.

A century and a half of American life and history
 this hundredth anniversary of American history has only just
 come to influence the development of American history.
 The independent history of nations and the history of the
 conditions of growth of nations, and the history of living
 seem to be the history of the world of the world.
 The democratic history, the history of the world of the
 conflict, and the history of the world of the world
 All seemed to be the history of the world of the world
 to the history of the world of the world of the world
 history of America.

The history of the world of the world of the world
 history of the world of the world of the world
 history of the world of the world of the world

targets. There may be considerable validity to the observation that the European settlers of Africa and Central and South America exhibited a fatal lack of foresight, as compared to that of their cousins in the settlements of North America, with respect to the policy applied to the native populations encountered. Be that as it may, the American method was certainly effective. It was in keeping with the pragmatic, total solution sought by the frontiersmen and reflected the American aversion to chronic insecurity and preference for a complete clear-cut victory.

Factors Inhibiting Psychological Operations

There was a rough honesty that wove its way through the process of taming the continent. There was little inclination to consider psychological methods, and even less time or material means for affecting such operations. The moralistic foundations of Puritan and evangelical Protestantism that spread over the land lay across any such course of action. The soul and mind were the province of God and to trespass into this domain was not fitting. It smacked of deceit and bordered on immorality. Practically, it was too slow and inconclusive.

Although the developing features of the American conduct of the government process had little if any effect on American attitudes towards psychological factors in politico-military affairs, nevertheless the developing pattern had

definite bearing upon any future, effective use of psychological operations. The empirical approach tended to permit small, long-range problems to be overlooked until they reached major proportions. There was a developing tendency to permit fundamental policy decisions to take the form of compromise solutions, to accord all units in the organization a voice in major decisions. The fundamental American distrust of authority and hegemony lay behind the marked propensity towards multiple, overlapping, and layering agencies, bureaus, and offices working in the same field. The constitutional principle of division of powers, when applied at the working level, produced large-scale units which tended to obscure the field of vision and limit flexibility and rapidity of response.

The American heritage, therefore, does not reflect a basic set of values or operational patterns which predispose the American people to the employment of psychology against the masses of the world. That such is the case is reflected in the reluctance with which the employment of psychological operations is approached. Although there have been noteworthy instances throughout American history when psychological operations have been employed, the overall history of this instrument of foreign policy has been one of rejection or reluctant use inhibited by a moralistic sermonizing which has, to date, prevented the development and employment of an effective American psychological campaign.

deliberate policy from any source, sensitive use of opinion
 logical operators. The logical operators seem to be
 well, long-range operators as in developing early days
 reached major proportions. There are a developing category
 to specific commercial policy decisions as well as the use of
 commercial operators. As noted all cases in the operator-
 case a case in major decisions. The commercial operators
 distinct in nature, and beyond the point of view
 proposed towards subjects, including, and beyond the
 case, however, and others working in the same field. The
 constitutional principle of division of power, often applied
 at the working level, is a logical operator with which
 tended to operate for the sake of vision and limit itself
 and reality of resources.

CHAPTER III

SOVIET ORGANIZATION AND EMPLOYMENT OF PSYCHOLOGICAL OPERATIONS

The Cold War is not novel. It closely resembles the intercivilizational wars of the past in which competing civilizations with divergent moral and political foundations fought one another for final survival. The struggle being waged in mid-twentieth century is similar to the protestant-catholic Thirty Years War of 1618 to 1648. The only parallel in American history is to be found in the frontier Indian Wars, with the exception that the American Indian never posed the threat of sweeping a white and Christian civilization, once it had established a foothold, from the continent.¹

I. THE ROOTS AND NATURE OF SOVIET PSYCHOLOGICAL OPERATIONS

The Cold War is, therefore, a struggle, which is now being waged between non-communist states and a communist group of nations. The roots of this conflict can be found at any one of several dates (1848, 1917, 1943, and 1946 are a few of those given). However, this East-West relationship

is mainly the product of developments of the present century, the two most important of which were:

1. The completion of the expansion of the Russian state to a point where further expansion was practically impossible except at the price of conflict with some other great power. Hand-in-hand with this went the development of Russia into one of the World's major military and industrial powers.
2. The capture of power throughout Russia by a group of men, led by Lenin, and inspired by the Marxist ideology as Lenin had developed it.

With the healing of the ravages of World War I, the Soviet Union began to resume the march of economic and military development which had been in progress before that war. World War II only temporarily halted the physical--though not the planning--progress toward that ultimate realization of the traditional role of Russian rulers--supremacy in the competition for position amid the territorial and military rivalries of the Eastern European and Asiatic areas.

The conduct of this Soviet campaign has been carried out by means of a precisely orchestrated application of all four tools of foreign policy: diplomacy, economics, coercion, and psychology.

In 1940, Molotov told the former Foreign Minister of

is mainly the product of developments of the present century, and the two most important are:

1. The completion of the unification of the Russian state as a result of the Russian Revolution and the formation of the Soviet Union, which has led to the development of the Russian state as a world power.

9. The completion of the unification of the Russian state as a result of the Russian Revolution and the formation of the Soviet Union, which has led to the development of the Russian state as a world power.

10. The completion of the unification of the Russian state as a result of the Russian Revolution and the formation of the Soviet Union, which has led to the development of the Russian state as a world power.

The content of this book is based on the latest research and is intended to provide a comprehensive and up-to-date account of the Russian Revolution and the formation of the Soviet Union.

The book is written in a clear and concise style, and is suitable for both students and general readers. It is a valuable addition to the literature on the Russian Revolution and the Soviet Union.

It is hoped that this book will be of interest and value to all who are concerned with the history of the Russian Revolution and the Soviet Union.

Lithuania:

We don't fight America. But when we shall have deprived America of her markets, crisis will come, and that crisis will call forth confusion, and the American Workers will appeal to us to come over and restore order. Presently, the American worker is well off, and, of course, we can't get to him. The Worker will not submit. Consequently, we must cause unemployment in America. After we have taken her markets in Europe, expelled her from Asia and elsewhere, she will have no markets to dump her goods on. She will curtail production and there will be unemployment. We shall then be able to settle our accounts with America.²

The chief target, as the foregoing quotation and countless others indicate, has been the United States. The Soviet master plan is global in scope and finds support in a worldwide psychological warfare campaign and propaganda apparatus. The "peaceful coexistence" campaign is one major aspect of these psychological operations. Within the plan, direct Soviet military force is to be withheld. Soviet psychological operations seek to frustrate or nullify the will of individuals or nations, to inhibit action, confuse and instill doubt, promote inertia, and keep its victims on the ideological defensive. Once general moral dislocation has been brought about--total paralysis of Western will and debilitation of Western military, economic, and political power--the optimum time will have arrived for the decisive

²Robert S. Byfield, The Fifth Weapon (New York: n.p., 1954) cited from VOA broadcast by Dr. Vencas Kreve-Mickevicius in 1952, p. 7.

contest. Only at this point, provided the military capability of the USSR to launch an effective surprise attack and subsequent second and third strike blows of exploitation has been brought to the qualitative and quantitative level required, and provided the risks of the contest are considered acceptable, will direct military action be applied.

In examining Soviet psychological operations, it shortly becomes very apparent that the study is not one of some new power of the word, but rather a study of an organizational weapon. The word--propaganda--does not stand alone in Soviet planning. Communist leaders and theorists have ever maintained that words had to merge with deeds and that both of these must submit to organization.³ Rather than directing their efforts to fighting a battle for all men's minds, Soviet psychological operations seem oriented towards winning the minds of certain key groups in order to seize the material sources of power by which the minds of the masses are supposedly influenced.

II. SOVIET CONCEPTS OF PSYCHOLOGICAL WARFARE

The Soviet concept of psychological warfare is realistic and unified. As there is no sharp separation

³Wilbur Schramm, "The Soviet Concept of Psychological Warfare," Four Working Papers on Propaganda Theory (University of Illinois: January, 1955), p. 101.

between words and deeds, so also there is no demarcation between political and military warfare. Rather, there is the concept of a Party acting--using words and deeds in such combinations as are needed to further the class struggle. There is no differentiation between war and peace since there can be no peace so long as the class struggle continues. It is the power of a disciplined, ruthless, Combat Party which, in the last analysis, represents the communist "discovery" in the field of psychological operations. To study Soviet psychological warfare it is, therefore, necessary to examine the concept of this Combat Party, its beliefs and goals, its world view, its organization, and its tactical doctrine.

The communist theory of psychological warfare rests upon the importance of clear doctrine. Whereas, the Party leadership need not be concerned with the consistency of statements it makes, it must be sure of the consistency of its position on all issues.

Running through Lenin's writings, and current Soviet ones as well, is the horror . . . lest one small ideological slip lead to a catastrophic political error. Under Bolshevik assumptions ideological error automatically and inevitably leads to political disaster. The consequence has been the development of strict central control over vital questions of doctrine.⁴

⁴Barrington Moore, Terror and Progress (Cambridge: Harvard University Press, 1954), p. 109.

There are no doubts as to the fact that the...
There is no difference between the two...
conditions as we found in the two cases...
the amount of a very slight...
between the two...
between the two...
between the two...

Poor theoretical leadership to the communists, consequently, means poor organizational leadership. "Lack of theory has been primarily responsible for . . . past opportunistic mistakes."⁵ ". . . if our party propaganda for some reason goes lame . . . then our entire State and Party work must inevitably perish."⁶

That the Soviet leaders subscribe to the foregoing view of Stalin is unquestionable in the light of the extent and ramifications of the psychological operations of the Soviet Union.

III. BOLSHEVIK THEORY AND PSYCHOLOGICAL OPERATIONS

In Bolshevik theory, power is social, resident in people, latent in all social institutions, and generated in the course of all kinds of social actions. To Lenin, the mass represented the greatest reservoir of energy. The availability of this energy increases with the intensity of the class struggle and gain in efficiency as it is organized

⁵ Communist Party in the Philippines, Report on the Political Situation, A Report of the General Secretary of the Communist Party in the Philippines (no publishing data, 1946 or 1947).

⁶ Louis Nemzer, "The Kremlin's Professional Staff," American Political Science Quarterly, XLIV (March, 1950), p. 72.

and directed.⁷

The proletariat has no other weapon in the fight for power except organization . . . the proletariat can become and will become a dominant force only because its intellectual unity created by the principles of Marxism is fortified by the material unity of organization which welds millions of toilers into an army of the working class.⁸

This power of organization is possessed by the Party which consequently regards itself as the advance guard and leader of the mass. The Party thinks of itself as a sort of general staff which transforms a diffuse population into a mobilizable source of power through the establishment of organs of access and control. It is custodian of basic doctrine, expert in organization, eyes and ears for the mass, and the guide into action.

However, when the mass accepts this guidance, it also accepts strict control. Scholars have observed that the Party operates on the Bonapartist assumption that delegation of authority to leadership places the leadership in unlimited control during its period of office.⁹ Consequently, attacks against the leadership are equivalent to treason

⁷Philip Selznick, The Organizational Weapon: A Study of Bolshevik Strategy and Tactics (New York: McGraw Hill, 1950), p. 254.

⁸Vladimir Ilyich Lenin, Collected Works (New York: International Publishers, 1927), p. 204.

⁹Schramm, op. cit., p. 106.

The organization has no other weapons in the light of
power except organized . . . its organization can
become and will become a dominant force only because of
its intellectual unity created by the principles of
science is limited by the material unity of organ-
ization which will allow it to collect ideas and
of the world class.

This power of organization is possessed by the party which consequently regards itself as the sovereign power and leader of the mass. The party thinks of itself as a sort of universal state which transforms a diffuse population into a solidified source of power through the establishment of organs of action and control. It is a method of basic de-
fense, expert in organization, eyes and ears for the mass, and the guide into action.

[illegible]

⁸Virginia Linton Smith, Collected Works (New York: International Publishers, 1967), p. 294.

against the state, and the political apparatus must provide whatever control structure is necessary to mobilize and direct the energy of the mass.

These controls fall into three categories: (1) Party; (2) secret police and armed forces; (3) the Soviet apparatus.¹⁰ The Soviet apparatus is largely a technical means; the police and the army represent the ultimate negative control. Under the Party is found the politically positive function performed by the elaborate propaganda apparatus and by the control and deliberate manipulation of all media of mass communications.

Soviet information policy . . . seeks to deny to men the data and concepts required to formulate an alternative to the system. Police and Party control are designed to prevent men from crystallizing effective action should they formulate an alternative.¹¹

Since the 1920's, the role of the mass has become more passive and the role of the Party more important. This does not imply that the power of the mass is not still basic to Bolshevik thinking or that the Party does not still think of itself as a general staff of the mass. Rather, the implication lies in the increased importance attached to the maneuverability of the Combat Party within the Soviet strategy.

¹⁰Moore, op. cit., p. 7.

¹¹W. W. Rostow, The Dynamics of Soviet Society (New York: The New American Library, 1954), p. 164.

against the state, and the political apparatus must provide
 whatever control necessary to maintain its control and
 direct the activity of the state.

These concepts will also have implications: (1) Party
 (2) Party policy and action program; (3) the Party apparatus.
 The Party apparatus is largely a technical matter,
 the police and the army apparatus and the various administrative
 bodies. Under the Party is found the politically sensitive
 function performed by the various propaganda agencies and
 by the control and administrative manipulation of all media of
 mass communication.

Lower information policy is a matter to be left to the
 state and Congress. The Party is to be left to the
 Party to the state. The Party is to be left to the
 Party to be left to the Party. The Party is to be left to the
 Party to be left to the Party.

Since the 1930's, the role of the state has become
 more passive and the role of the Party more important. This
 does not imply that the power of the state is not still basic
 to Bolshevik thinking or that the Party does not still think
 of itself as a central staff of the state. However, the in-
 creased role of the Party has increased importance attached to the
 responsibility of the Party with the state.

Strategy.

¹⁰ Moscow, 1934, p. 7.
¹¹ V. I. Lenin, The Organization of the Party (Moscow, 1947), p. 104.
 (The New American Library, 1947, p. 104.)

As the mass must submit to the dictatorship of the Party, so must the Party submit to the dictatorship of its central bureaucracy and the Party leaders. Here, as everywhere else, appears the Bolshevik faith in organization. Such organization implies a strictly monolithic party. No competing power structures and no substantial deviations in ideology are permitted. No other type of organization could withstand the changes of course and the ceaseless combat required of the Party.

The Party is never thought of as identical with the entire mass. It is always a minority whose central task it is to guide the mass in the desired direction, to interpret doctrine, and to specify the relation of that doctrine to strategy and tactics in a given situation. The Party is, therefore, carefully organized, rigorously disciplined, constantly at war. Only when the proletariat achieves total victory will there be peace.

The mass, then, is the chief source of power for the communist strategy and in seeking to arouse, harness, and direct this power, communism turns to those points in the modern, industrial world where permanent and reliable tensions exist--to the colonial countries, to the "peasantry" where oppressive conditions still exist in wide areas of the world, to the labor movement, to any situation which creates resentment. Communism seeks to place Party agents at the

At the same time, however, the responsibility of the party is not to be confused with the responsibility of the central committee, and the party leaders, who, as every-
 where else, represent the interests of the party.
 Such organization implies a strictly democratic party. It
 is based on the principle of the equality of all members and
 the equality of all members. No other type of organization can
 withstand the changes of course and the changes of
 opinion of the party.
 The party is never stronger than it is identical with the
 entire mass. It is always a minority whose central task is
 to guide the mass in the right direction, to interpret
 doctrine, and to spread the doctrine of that doctrine to
 everybody and leading in a given situation. The party is
 therefore, centrally organized, vigorously disciplined, com-
 pletely of one mind, only when the proletarian revolution is
 victory will there be peace.
 The party, then, is the chief source of power for the
 communist movement and is striving to become, through the
 labor and power, communist and to make power in the
 labor, industrial world more powerful and reliable to-
 ward the proletarian revolution, to the "proletariat".
 While the proletarian revolution will exist in the form of the
 world, in the labor movement, in any situation which creates
 conditions, Communist must be given every chance to the

head of whatever social forces will set the masses in motion and, at the appropriate time, strike paralyzing blows at the capitalistic economy. The basic communist view is "not to create a mass movement, but to link itself to one which history has already begotten, to establish leadership over it, and to ride to power on its shoulders."¹²

IV. GENERAL PSYCHOLOGICAL STRATEGY

The role of psychological operations at this juncture is to gain adherents and transform them from adherents into agents from whom total conformance can be demanded. The propaganda employed for this purpose has a high doctrinal content.

Once the nuclei are available, the Party can begin to operate and maneuver. It works at first from within, and its targets are the nerve centers of society--key industries, political parties, and other organizations which fulfill enduring needs and which offer tensions that can be capitalized upon.

Once the nerve centers of society have been penetrated, the Party's agents can begin to maneuver in terms of government itself. The communists are, by this time, strong enough to act as political parties, unions, and the like and

¹²Selznick, op. cit., p. 171.

need of whatever action there will be the answer is within
 and, at the appropriate time, within existing laws is the
 legislative remedy. The basic communist view is that the
 create a mass movement, but to find itself in one which dis-
 tory has already begun, to establish leadership over it,
 and to ride to power on its shoulders.¹²

IV. GENERAL STRATEGICAL ANALYSIS

The role of psychological operations in this context
 is to gain influence and leadership from those individuals who
 appear from their social environment can be controlled. The
 propaganda campaign for this purpose has a high potential
 impact.

From the social and political, the party and party in
 operation and movement. It works at first from within, and
 its targets are the mass centers of society—its industries,
 political parties, and other organizations which fulfill
 existing needs and which other people have can be replaced.

From the mass centers of society there have been
 power, the party's needs are being to influence in order of
 government itself. The communist has, by this time, already
 enough to act as political parties, unions, and the like and

¹² Statement of J. Edgar Hoover, p. 214.

to make alliances with other power groups. These alliances are, however, fleeting relationships to be entered into with due caution and wariness and used as steps to greater power. At no time does the Party lose sight of the fact that its momentary ally is a future enemy; and it never places more than momentary reliance on the support of outside groups.

This was the stage of maneuver when the USSR allied itself with the United States and the Western European powers against Germany, maintaining a suspicious and wary attitude throughout the relationship, and discarding its allies as soon as the objective of the alliance had been achieved.

Psychological operations during such a period are oriented towards: (1) maintaining a sense of mission among the faithful; (2) fostering a sense of complacency toward the Party amongst the present allies and future enemies; (3) diverting attention to a common enemy; (4) encouraging disunity and disaffection among other power groups.

The encouragement of conflicts among potential enemies is a late stage in the period of political maneuvering through alliances and applies not only to maneuvering within a country but also to operations on an international scene. The objective is to set the stage for the final act for which all the others are preparing: the seizure of power by the Party.

to make alliances with other power groups. These alliances are, however, tactical relationships to be entered into with one caution and restraint and used as steps to greater power.

At no time does the Party lose sight of the fact that its temporary ally is a lesser enemy; and it never places more than temporary reliance on the support of outside groups. This was the logic of alliances when the USSR allied itself with the United States and the Western European powers against Germany, maintaining a suspicious and wary attitude throughout the relationship, and dissolving the alliance as soon as the objectives of the alliance had been achieved.

Technological questions during such a period are oriented towards: (1) maintaining a sense of unity among the ranks; (2) focusing a sense of conspiracy toward the Party against the present allies and future enemies; (3) diverting attention to a lesser enemy; (4) encouraging unity and discipline among what power groups.

The development of conflict among potential enemies is a task which is the lot of political maneuvering through alliances and enemies not only to maneuvering within a country but also to operations on an international scene. The objective is to set the stage for the final act for which all the others are preplanned. The release of power by the

In a conflict between two powers, the Party will try to intervene late in the conflict and in a decisive manner. Such a policy was followed in the case of entering the war with Japan in 1945. In such a struggle, said Stalin, the Party should ". . . not sit still with idle hands. We will have to come out, but to come out after the others. And we shall come out for the purpose of throwing the decisive weight into the scales of fate."¹³ The Party should always be ready to take advantage of such a crisis and the great opportunities for swift advancement which often present themselves. This is the objective of the organization and training of the Party--to be ever ready with proved techniques, unquestioning discipline, and a clearly understood goal in order to take advantage of every opportunity small or large.

In the final stage of operations, when the Party is strong enough to liquidate its temporary allies and seize power itself, the task of psychological operations is to demoralize the enemy, strengthen confidence within the Party, and once power is gained, maintain proper orientation of the mass.

The time table for such operations is a long one, and the rate of advance is uneven. Party patience and constant

¹³Joseph Stalin, Works (Moscow: State Publishing House, 1952), p. 201.

In a similar manner the Party will try to intensify its work in the various spheres. Such a policy was followed in the case of working for the Party in 1947. In such a situation, said Stalin, the Party should "not sit still with its hands. We will have to come out, but we come out after the others. And we shall come out for the purpose of showing the decisive victory over the forces of reaction." The Party should always be ready to take advantage of every crisis and the opportunities for swift advancement which often present themselves. It is the objective of the revolution to bring to the Party—to its Party—with proved leadership, outstanding discipline, and a clearly defined goal in order to take advantage of every opportunity that of itself.

In the final stage of operations, when the Party is strong enough to liquidate its domestic allies and seize power itself, the task of psychological operations is to demoralize the enemy, strengthen confidence within the Party and once power is gained, maintain proper orientation of the Party.

The time scale for such operations is a long one, and the rate of advance is uneven. Party discipline and constant

pressure underlie the operations. This kind of strategy requires long-range policy. Stalin stated: "We cannot move forward without knowing where it is necessary to go, without knowing the aims of the movement. We cannot build without perspectives."¹⁴

V. PROPAGANDA, AGITATION, AND ORGANIZATION

Communism has never relied entirely upon propaganda for its program; rather, it has sought to control directly the arena of conflict. This has required the refinement and employment of all phases of psychological operations for effective intervention through the Combat Party and peripheral organizations. It entails the direct weakening of propaganda targets and the development of an organizational strategy designed to afford maximum accessibility and to neutralize opposition. It is, therefore, very clear that the action aspects of psychological warfare are not restricted to the "propaganda of the deed," but include efforts to control the conditions under which agitation and propaganda are carried out.¹⁵ Propaganda, agitation, and organization represent an unbroken continuum within Soviet psychological warfare.

¹⁴Cited in Selznick, op. cit., pp. 8 and 279.

¹⁵Ibid., p. 7.

Plekhanov defined the famous distinction between agitation and propaganda.¹⁶ A propagandist, he stated, presents many ideas to one or a few people, whereas an agitator presents only one or a few ideas to a mass of people. An agitator fastens his attention on a concrete injustice, leaving to the propagandist the task of giving a complete explanation. There has never been a sharp dichotomy between agitator and propagandist in Soviet thinking. Both are needed in the operations of the Combat Party, and, as the technology of mass communications has developed, the distinction has faded.

Soviet psychological operations are based, in part, upon the discoveries and accomplishments of the psychologist, Pavlov. Just as Pavlov substituted the ringing of a bell for food in the mind of a dog as a stimulus to cause the reaction of hunger, so do the communists use propaganda to make their programs palatable in the minds of men.

. . . for years research has been going on in the USSR into the mechanisms of verbal propaganda, probably in conjunction with research into methods by which the effect of such verbal stimuli can be reinforced with accompanying visual stimuli.¹⁷

The application of Pavlovian principles is systematic

¹⁶G. B. Plekhanov, Works (Moscow: State Publishing House, 1927), p. 187.

¹⁷Alan M. G. Little, "Pavlov and Propaganda," Problems of Communism, II:2 (1953), p. 18.

...the same distinction between ap-
 plication and hypothesis. It is, however, possible
 only, inasmuch as one of the two, whereas the other has
 been only one of the ideas for a year or longer, in
 application. The latter is a concrete instance,
 leading to the hypothesis, the task of giving a complete
 explanation. There has never been a sharp dichotomy between
 application and hypothesis in actual thinking. Both are
 needed in the solution of the most difficult, and in the
 development of new conceptions in science, the distinction
 is not clear.

...theoretical questions are asked, in part,
 when the distinction and relationships of the hypothesis
 have been previously established and the task of a full
 explanation is the kind of a one as a whole, in which the
 relation of hypothesis to the conceptions are presented in
 such their reciprocal relation in the kind of one.

...the latter research has been going on in the
 field of the mechanism of verbal hypothesis.
 It is in connection with research into verbal
 hypothesis that the effect of such verbal stimuli can be re-
 sulted with accompanying visual stimuli.
 The application of hypothesis in science is systematic

and pushed with great energy. As soon as the communists establish monopoly over the means of communication in a newly-acquired area, they set in motion a highly semi-scientific process of enforced indoctrination.

It is the Soviet system to analyze thoroughly the conditions prevailing in a given area and to deduce from them the ideas which are most likely to appeal to the minds of men. The propaganda is then related to men's environment and their state of mind. No values are projected into the area. The values assumed are those maintaining in the area where the party line is propagated. There is a convenient confluence at this point between the Pavlovian relationship between oral and visual stimuli and the Marxian principle of primacy of men's physical surroundings over their thinking. While these principles may be debated, the undeniable fact remains that their application in propaganda brings results.

Pavlov's dog responded to a bell only after constant repetition and reinforcement of this response. The remarkable single-mindedness of purpose and the relentless reiteration of clearly-defined ideas followed by the communists are based on this principle. "This constant repetition is the most notable feature of Bolshevik propaganda, and is the reason why Soviet newspapers and radio programs are so

desperately monotonous."¹⁸ The repetition and pounding may seem monotonous to be sure, but the desired effect is achieved when the idea is finally lodged in man's subconscious mind. Men learn the party line not knowing how. They learn the communist way of thinking, even while they imagine they are offering resistance. Thought-provoking is the observation:

Fire and sword were necessary to impose faith upon our more remote ancestors. Pressure had to be used to make their children say their prayers. But their grandchildren and great-grandchildren prayed without constraint and from conviction.¹⁹

Soviet propaganda does not rely on overt methods alone. The several sections of the Department of Propaganda and Agitation attest to this; movies, the theatre, fictional literature, and music--all are employed for their revolutionary significance or for their portrayal of the evil and follies of bourgeois life, particularly the greed and selfishness that is provoked by money and property under the capitalist order.

Aside from the camouflage which these indirect means of conveying the party line provide, an essential feature of them all is their capacity to awaken emotion in the mind of a recipient. Coupling an aroused emotion with a suggestion

¹⁸Alexander Uralov, The Reign of Stalin (London: The Bodley Head, 1953), p. 189.

¹⁹Uralov, op. cit., p. 191.

ideologically inconsistent.¹⁸ The expectations and growing way
 are necessary to be true, but the limited extent to

 contrasted mind. And then the party-line and moving new
 They learn the commonest way of thinking, even while they
 imagine they are offering resistance. Group-mentality is
 the consequence.

Size and speed were necessary to Japan's early years
 and also to the success. Progress had to be made
 to make small children very early on. The state
 established and party-orientation began almost
 constant and from childhood.
 Soviet propaganda does not only in every school
 alone. The several sections of the movement of propaganda
 and education affect the mind, motion, and behavior, emotional
 literature, and music—all are aimed at their control.
 Every dimension of the state controlled at the level and
 holder of propaganda like propaganda for good and evil.
 Indeed that is revealed in many and properly about the
 established order.

Also from the knowledge that these limited means
 of conveying the party line to the, an essential feature of
 that all is state capacity to control motion in the mind of
 a nationalist. Coming to control motion with a suggestion

from party doctrine is effective in indoctrinating those targets of Soviet psychological operations whose lives are notably drab or without hope, and who are, therefore, especially susceptible to such methods.

VI. THE ROLE OF MASS COMMUNICATIONS

The Soviet regime places great emphasis on wide dissemination of its decisions and policies. The monopoly over all media of mass communications gives it unique opportunity and virtually unlimited resources. It can direct and control the flow of information and, at any given moment, virtually saturate all public media with whatever subject is considered of greatest importance.

The press and radio are the principal media by which decisions of the Party and government are publicized. Pravda and Izvestia are the two largest central newspapers. Pravda, the official organ of the Party, lays particular emphasis on Party matters; Izvestia, the chief organ of the Council of Ministers, stresses government affairs. Of the two, Pravda is the more authoritative.²⁰ Pravda, Sovetskaya Rossiya--the newspaper of the Party bureau for the RSFSR (the largest

²⁰United States Congress, Senate, Committee on Government Operations, "National Policy Machinery in the Soviet Union," Organizing For National Security, Vol. II (Washington: Government Printing Office, 1961), p. 407.

Republic)--and Kommunist, the Party's theoretical journal, have the status of departments under the Party secretariat.²¹ As such, they receive guidance directly from the Party secretariat and not, as in the case of Izvestia and other Soviet newspapers, from the Propaganda and Agitation Department. However, these three publications and the Department work closely together, and their activities are well coordinated.

The radio is another important medium of communication for the regime. All radio stations in the USSR are under the general supervision of the All-Union Radio and Television Committee which, although an organ of the government, is closely supervised by the Department of Propaganda and Agitation. Radio Moscow, the largest station, is equipped with the most modern and powerful transmitters for long-range broadcasts to foreign as well as domestic audiences. Its broadcasts are monitored by local stations throughout the USSR and relayed to remote areas or rebroadcast locally.

Radio stations play an important role in familiarizing the population with important Party and government decrees and in transmitting official explanations and "clarifications" of established policy. In this, the radio relies

²¹Ibid., p. 408.

heavily on the press. Radio stations allot considerable time to broadcasting texts of Pravda editorials.

Pravda is an official channel for informing lower level officials of policy decisions.²² Pravda not only transmits the texts of decrees but, in accompanying editorials, interprets them and lays down broad policy guidelines. Second-echelon officials are expected to read Pravda daily and act accordingly.

The Soviet wire service, Tass, is yet another medium of government communication. It is an agency of the Council of Ministers.²³ Tass, with offices throughout the world, gathers foreign news for the use of Soviet domestic radio and newspapers and transmits domestic Soviet news abroad. It is also a major network for the gathering and transmission of news between Moscow and the provinces. Tass bureaus throughout the Soviet Union play an important part in reporting important local developments, and Pravda prints numerous articles received from local Tass offices.

VII. THE DEPARTMENT OF PROPAGANDA AND AGITATION

The organ of the Communist Party which is designed to mold public opinion and to conduct psychological operations is the Department of Propaganda and Agitation. The mandate

VII. THE CHALLENGE OF THE FUTURE

The system is an important factor in the development and effectiveness
of the system and the level of activity.¹⁶ There are three
throughout the world and play an important role in the

of this Department, prescribed by the Central Committee of the Party, is as follows:

The Central Committee of the All-Russian Communist Party of Bolsheviks decrees: To concentrate in the department of propaganda and agitation all work on written and oral propaganda of Marxism-Leninism and mass political agitation (Party press; publishing of propaganda and agitation literature; organization of written and oral propaganda of Marxism-Leninism; control over the ideological content of propaganda work; selection and assignment of propaganda cadres; political training and retraining of Party cadres; organization of mass political agitation.)²⁴

The Party maintains direct or indirect control over all public information and permits no independent commentary or analysis of its decisions and policies. Since the functions of propaganda and agitation have remained one of the most important considerations of the Party during its entire existence, control of these activities is at a very high point in the Party hierarchy.

The Department of Propaganda and Agitation is administratively located in the Executive Staff of the Party Secretariat.²⁵ Within the terms of guidance and top policy decisions developed by the Presidium, the Department determines both the general line and the specific courses of

²⁴ Cited in Albert M. Leavitt, Propaganda and Agitation in the Soviet Union (Oberammergau: Army Institute of Advanced Russian Studies, 1956), p. 14.

²⁵ Senate Committee on Government Operations, op. cit., p. 407.

psychological action to bring the Party decisions to fruition. Both the Presidium and the Secretariat are headed by Nikita Khrushchev. Consequently, the interlocking arrangement of policy formation and implementation can be focused directly on the psychological facets of execution.

The title of the organ which has fulfilled this function within the Party has often changed, the internal arrangement has varied, and the importance of its role has fluctuated. It has always existed, however, and generally has been very important, fulfilling its functions as eyes and ears of the Party and, more important, the voice.

The directors of the Department have been prominent in Party affairs. Zhdanov reorganized the Department in 1938 and remained closely connected with it until his death in 1948;²⁶ Shepilov and Suslov served as directors.²⁷ Other lesser-known men step from the Department of Propaganda and Agitation to high government and Party posts.²⁸

Despite the range of its responsibilities, the Department is not primarily an operational agency. The Department does not make basic propaganda policies--that function is

²⁶Nemzer, op. cit., pp. 72-73.

²⁷Pravda, 26 February 1956.

²⁸Meisel and Kozera, Materials for the Study of the Soviet Union (Ann Arbor: The George Wahr Publishing Co., 1953), pp. 193-197.

the prerogative of the Presidium and the Central Committee. Nor does the Department actually administer the program of propaganda, agitation, and psychological operations in general; responsibility for day-to-day operation of the program rests with the government agencies. The Department does no major publishing and does not operate the Soviet radio or newspaper networks. It functions, instead, as planner, director, and watch dog for all media. Its authority touches every realm of intellectual endeavor and every form of organized activity which might conceivably influence public opinion.

At every level of Party administration, there are propaganda and agitation departments with their own personnel in key positions in all local communications media as well as in important factories and other enterprises. Directives and instructions are sent out from the parent Department to local offices and the worldwide network of Party cells. Every Party cell is a nerve end for this system. From these nerve ends as well as from local offices flows a constant stream of reports back up the chain to the Department. This basic data is gathered and analyzed for the consideration of the Presidium and Central Committee in the development of psychological policies. The high-level policy decisions thus reached are then interpreted and disseminated by the Department. Thus the organization acts as a two-way channel

The perspective on the provision and the Central Committee. For these the Department actually administers the program of propaganda, agitation, and psychological operations in general, responsibility for day-to-day operation of the program rests with the government agencies. The Department does not major political and does not operate the Soviet radio or newspaper networks. It functions, instead, as planner, director, and advisor and for all intents the authority reaches every realm of intellectual endeavor and every form of organized activity which might conceivably influence public opinion.

At every level of Party administration, there are propaganda and agitation departments with their own personnel in key positions in all local communication media as well as in economic sectors and other enterprises. Directives and instructions are sent out from the highest departments to local offices and the worldwide network of Party cells. Every Party cell is a nerve end for this system. From these nerve ends as well as from local office lines a constant stream of reports flows up the chain to the Department. This basic data is gathered and analyzed for the formulation of the provision and Central Committee in the development of psychological policies. The day-to-day policy decisions have received the most intensive and concentrated by the Department. Thus the organization acts as a two-way channel

which constantly integrates the evaluated results of the "feed back" function of its operations into a regenerative cycle of psychological policy formulation and thereafter applies the policy correction to the operating conditions in the field.

Until 1920, there was no institutionalized system of propaganda and agitation in the Soviet Union. There was, of course, a propaganda and agitation effort, but it was not until 1920 that the Department of Propaganda and Agitation was created within the Secretariat of the Central Committee. In 1921, the Department was formalized as a Party organ, receiving an extensive mandate which foretold the extent of present-day activities.²⁹ In 1928, the formerly separate Press Section was incorporated into the Department structure.

In 1930, in connection with the reorganization of the Secretariat which had as its purpose the decentralization of cadre responsibilities within the Secretariat, a change was made in the Department of Propaganda and Agitation.³⁰ The functions of the old Agitation and Propaganda Section were divided between two new sections: Agitation and Mass

²⁹Alex Inkeles, Public Opinion in Soviet Russia (Cambridge: Harvard University Press, 1950), p. 32.

³⁰Merle Fainsod, How Russia is Ruled (Cambridge: Harvard University Press, 1953). This volume presents an outstanding, unclassified, source on the early history and administrative development of the Department of Propaganda and Agitation.

which constantly emphasized the intended result of the "back-to-back" character of the operation into a comprehensive study of psychological factors for formation and alteration of the policy position for the operating conditions in the field.

Well 1910, there was an institutionalized system of propaganda and agitation in the Soviet Union. There was, of course, a propaganda and agitation effort, but it was not until 1911 that the Department of Propaganda and Agitation was created within the Department of the Central Committee. In 1911, the Department was organized as a party organ, receiving no separate funds which covered the amount of present-day activities.¹⁸ In 1912, the formerly separate Press Section was incorporated into the Department structure. In 1920, in connection with the reorganization of the Department which had as its purpose the dissemination of mass responsibilities within the Department, a change was made in the Department of Propaganda and Agitation.¹⁹ The functions of the old agitation and propaganda Section were divided between the new sections: agitation and mass

¹⁸ Also included in the Department of Propaganda and Agitation (Central Committee) (Moscow, 1920), p. 21.

¹⁹ While there is no doubt that the Department of Propaganda and Agitation was created in 1911, the actual date of its creation is not clear. It is possible that it was created in 1910 or 1909. The Department of Propaganda and Agitation was created in 1911, but the actual date of its creation is not clear. It is possible that it was created in 1910 or 1909.

Campaigns and Culture and Propaganda. The section for Agitation and Mass Campaigns was mainly concerned with creating enthusiasm for industrialization and collectivization. The Culture and Propaganda Section had in its sphere of supervisory operation the press, education, science, literature, and propaganda of Marxism-Leninism.

In 1934, the old Culture and Propaganda Section was replaced by a new Section on Culture and Propaganda of Leninism.

In 1935, this new section was dissolved and five new ones developed to fulfill the same functions. These new sections were: Party Propaganda and Agitation, Press Publishing, Schools, Cultural-Industrial Work, and Science.

In 1939, in connection with the return of the functional arrangement of the departments of the Party, the function of propaganda and agitation now was to be fulfilled by the Propaganda and Agitation Administration. Zhadanov proclaimed:

The Central Committee of the All-Russian Communist Party of Bolsheviks must have a powerful apparatus of propaganda and agitation in the form of an Administration for Propaganda and Agitation, concentrating all work of written and oral propaganda and agitation.³¹

In 1948, functionalism was again discarded and the

industrial branch system re-adopted. The major change seems to have been a change of name to the Agitation and Propaganda Section and an assumed return, to the Section, of the control over assignment of key personnel within its sphere of activity. At the same time, propaganda activities were also assumed by the industrial-branch departments.

In 1952, the Rules of the Party effected a major reorganization of the higher Party organs by the formation of the Presidium. However, there was apparently no change in the organization of what had now become the Department of Propaganda and Agitation; it remains one of the departments of the Executive Staff of the Party Secretariat.

VIII. ORGANIZATION OF THE DEPARTMENT OF PROPAGANDA AND AGITATION

The scope and diversity of Party psychological operations is reflected in an examination of the internal organization of the Department of Propaganda and Agitation.³²

³²In dealing with the organization of the Department of Propaganda and Agitation, the student immediately encounters the lack of information published concerning detailed organization of the Party, in general, and the Department of Propaganda and Agitation, in particular. Since 1952, the Rules of the Party omit the more detailed description of the higher Party organs found in the earlier rules. There is no known unclassified Soviet source. The works of Barrington Moore (Terror and Progress), Louis Nemzer ("The Kremlin's Professional Staff" and "Word-of-Mouth Communication in the Soviet Union"), Alexander Uralov (The Reign of Stalin), and

At the apex of the structure is the Chief, his deputies, and personal assistants. Under the Department Chief comes the staff of the Department's publication: "Culture and Life."

In general, four vertical division headings can be assumed for grouping the various sections of the Department. These are: (1) Press; (2) Other Means of Mass Communication; (3) Education and Science; (4) Campaigns and Lectures.

Under the Press Division are sections for the Local Press, the Central Press (nationally circulated Moscow Press), Intermediate Press (republic, territorial, and regional press activities), and Publishing Houses. These sections supervise the activities of some seven thousand local newspapers, hold regional conferences for editors, conduct briefings and criticisms, check on performance, and closely supervise the Soviet publishing industry which is one of the most extensive in the world. The system of newspapers and publishing houses is considered to be basic for all other means of propaganda. It is a "megaphone" from which all other propaganda agencies take their cue.³³

Alex Inkeles (Communist Propaganda and Counterpropaganda and Public Opinion in Soviet Russia) serve as foundations for examining the current organization that can be derived from a study of the Department's operations and the bits of organizational information on the Party and the Government which exist in widely scattered sources.

³³Leavitt, op. cit., p. 21.

Under the Division of Other Means of Mass Communications are located sections for Radio, Motion Pictures, Art Affairs, and Fictional Literature. Although films and broadcasting are administered directly by other government agencies, these activities are closely watched and guided.

Communist attitudes on the role of literature, movies, and the arts--theater, music, painting, etc.--are revealing in so far as their inclusion within the purview of the Department is concerned:

. . . Communists cannot believe that an artist may be apolitical no matter how much he may wish to be. Since, in their view, a work of art is bound to have political consequences, it is understandable that, as the Communist rulers of Russia, they wish to control these consequences. Hence, they demand partiinost in art. Partiinost . . . carries all the overtones of enthusiasm, intelligent, loyal, and yet essentially uncritical acceptance of the Communist belief system.³⁴

Also,

Art provides one of the main channels through which an approved Party idea can be conveyed to a person without that person's realizing he is being "sold" on it.³⁵

Under the Education and Science Division are three sections: Cultural Enlightenment Institutions; Schools; and Science. The Cultural Enlightenment Institutions Section guides the activities of more than eight hundred clubhouses,

³⁴Moore, op. cit., p. 105.

³⁵Cited by Leavitt, op. cit., p. 21, from the writings of Karmakov in Institute for the Study of the History and Culture of the USSR (Munich: series 2, No. 13).

Communist activities in the field of literature, science,
and the arts - theater, music, painting, and - are revealing
in the fact that the Commission is the power in the
Government is concerned.

... Communist Party believe that an article may be published in which we must be very clear to be. Since, in this view, a word of our own to have political consequences, it is understandable that, as the Communist Party of Russia, they wish to control their newspapers. Now, they stand against in the United States. . . . Since all the members of the Party are loyal, and not essentially unfaithful to the Communist Party system.

[illegible]

During the discussion and science division the following points were discussed:

trade union centers, reading rooms and other cultural facilities in rural areas which are established by local educational authorities and Kolkhozes throughout the soviets.

The School Section informs educational authorities of the Party Line, ascertains compliance therewith, and studies educational problems with a view to determining new policies. The school system is one of the most widespread canals through which propaganda is disseminated.

The Science Section is concerned with all scientific endeavor, from agriculture to oil and gas research and the teaching of theory in higher institutions. Convinced Communists do not believe that it is possible for science to be non-partisan and place the same demand for partiinnost upon the scientist as that placed upon the artist.

The fourth division is the Division of Campaigns and Lectures and is made up of two sections--Propaganda and Agitation. The Agitation Section utilizes trained agitators to promote current Party programs. The Propaganda Section operates through trained Propagandists, personnel more highly qualified ideologically than the agitators. It is through the workings of these two sections that the Department of Propaganda and Agitation most closely approaches an operational body. Propaganda depends on techniques of communication. Agitation includes not only communication but also example and disciplined penetration by indoctrinated

these units, namely, reading rooms and other cultural facilities in local areas are established by local schools.

struction. Progress involves not only construction but

also progress and development of the system.

cadres. This conception underlies the continuity of propaganda, agitation, and organization.³⁶ The work of the Division of Campaigns and Lectures insinuates itself into every other division of the Department and pervades the entire scope of Soviet psychological operations.

This monolithic structure represents a total program. Its structure extends downward from the central government organization through the levels of the republics, regions, districts, and municipalities. Its specialist formation exists at every level of this vertical structure. Furthermore, at each level there is a horizontal structure which embraces the propaganda services of the Supreme Soviet, the different Ministries, the professional unions, the Communist youth, and the Armed Forces. The entire life of its target becomes the object of a program which spins a tightly-structured web of converging influences. The Combat Party operates everywhere; it uses the same organizational weapons; it responds to the same monolithic control. Its influences go into its human target's home, his work, his leisure. These influences aim at entire thought and behavior patterns.³⁷

... This condition underlies the necessity of pro-
 gress, adaptation, and organization. The work of the
 Division of Campaigns and Lectures illustrates itself in
 every other division of the Department and provides the
 entire scope of social psychological conditions.
 This monolithic structure represents a total process
 its structure extends downward from the central government
 organization through the levels of the republic, regions,
 districts, and municipalities. Its specialized formation
 exists at every level of total political structure. Further-
 more, at each level there is a horizontal structure which
 embraces the programs and services of the entire level, the
 military structure, the professional union, the Commu-
 nist party, and the armed forces. The entire life of the
 target becomes the object of a program which is a highly-
 structured web of converging influences. The Communist party
 operates everywhere; it uses the very organizational weapons;
 it responds to the same monolithic concept. Its influence
 goes into the human target's soul, his work, his leisure.
 These influences are it entire thought and behavior. The
 result is...

IX. EDUCATION FOR PSYCHOLOGICAL OPERATIONS

Zinoviev observed: "With us, propaganda and agitation are based on instruction Propaganda, instruction, and agitation are a unity which must be realized according to the Leninist conception of education."³⁸ This concept has three parts: (1) the mastery of Marxist-Leninist doctrine by the small group of advanced leaders who, in turn, (2) supervise the instruction and organization of the masses in the light of this doctrine, employing (3) all teaching devices, formal and informal, including schools, meetings, mass communications, and personal instruction and leadership.

The Party is responsible for training the masses and carries out its assignment through a complete network of schools. The school system is under the direction of the Department of Propaganda and Agitation and extends downward from the Academy of Social Sciences through universities of Marxism-Leninism, political schools, circles, Party evening schools, and also includes much-emphasized provisions for self-study of the works of Marx and Lenin.

The indoctrination and preparation of Party leaders is conducted with extraordinary care. The political school

IX. EDUCATION AND TECHNOLOGICAL OVERSIGHT

Linovitz observed: "With us, propaganda and agitation are based on instruction Propaganda, instruction, and agitation are a unity which must be realized according to the Leninist conception of education."³⁸

Concept has three parts: (1) the mastery of Marxist-Leninist doctrine by the small group of advanced leaders who, in turn, (2) supervises the instruction and organization of the masses in the light of this doctrine, employing (3) all teaching devices, formal and informal, including schools, meetings, mass communications, and personal discussion and leadership.

The Party is responsible for training the masses and carries out its assignment through a complex network of schools. The school system is under the direction of the Department of Propaganda and Agitation and includes members from the Academy of Social Sciences through universities of Marxist-Leninist, political schools, classes, Party evening schools, and also includes much-emphasized provision for self-study of the works of Marx and Lenin.

The indoctrination and preparation of Party leaders is connected with extraordinary care. The political school

³⁸ Cited in Leonid Gromov, "Leninist Propaganda," Soviet Union Quarterly, Summer, 1952, p. 452.

is the basic step in this training and is conducted at the level of the primary Party organization. It is designed to give students the basis of political knowledge, to develop in them elementary knowledge of how to study, and to accustom them to systematic development of their ideological-theoretical level. The instructors are trained propaganda specialists. Those who attend classes are Party members, candidates for the Party, or non-Party activists. Upon completion of a two-year, 120-classroom-hour course of study, graduates are expected to become members of the vast army of agitators.

The school system is organized in a pyramid for candidates throughout the Soviet world, and a promising leader can rise through it as he rises in Party prominence. The schooling is a continuous operation. Refresher courses are constantly in progress on all levels of the pyramid. A two- or three-year course is usually followed at appropriate periods by a nine-months' refresher.

The first step upward in this education pyramid is the district Party school. It is attended by lower Party and Komsomol (communist youth) functionaries who study such subjects as history, geography, five-year plans, and governmental and Party structure.

From the district Party school, the path leads to schools operated at regional, territorial, or national

is the basic step in this training and is conducted at the level of the primary party organization. It is designed to give students the basis of political knowledge, to develop in them elementary knowledge of how to study, and to accustom them to systematic development of their intellectual-theoretical level. The instructors are trained specialists. Those who attend classes are party members, candidates for the party, or non-party activists. Upon completion of a 2-3 year, 100-lesson-long course of study, graduates are expected to become members of the next step of education.

The second system is organized in a pattern for continuous learning and review, and a growing level of knowledge. It is organized as a series of party organizations. The knowledge is a continuous development. Refreshed courses are necessary in progress on all levels of the system. A two-year course is usually followed by a one-year course by a nine-months' review.

The third step ahead in this education system is the district party school. It is attended by lower party and non-party Communist youth organizations who study such subjects as history, geography, five-year plans, and government and party structure.

From the district party school, the party sends to

schools attached to hospitals, sanatoriums, or military

republic level. At these levels, two-year courses are conducted for officials at the district and city level for assumption of duties; such as, Party or Komsomol secretary, propagandist, newspaper editor, or intermediate level government official. The courses continue the fields of study found in the district school curricula with additional courses in dialectic and historical materialism, political economy, foreign policy, and international relations.³⁹

At the highest level in the chain of formal schools for the members of Party cadres, there are two institutions: the Higher Party School and the Academy of Social Sciences. The former is placed under the jurisdiction of the Department of Cadres and the latter under the Department of Propaganda and Agitation. The distinction made by this arrangement reflects the type of students studying at these two different, higher institutions of communist ideology. To the Higher Party School, under the Department of Cadres, go the functionaries of State and Party, Party secretaries, chairmen of ministries, and the like.⁴⁰ To the Academy of Social Sciences go the theoreticians, students, and teachers in

technical level. At these levels, two-year courses are com-
 pleted for officials at the district and city level for
 acquisition of theory, such as, study of economic activity,
 propaganda, newspaper editor, or administrative level.
 Government officials. The courses continue the study of
 study form in the district school course with additional
 courses in dialectic and historical materialism, political
 economy, foreign policy, and international relations.¹⁰
 At the highest level in the chain of Soviet schools
 for the majority of party cadres, there are two institutions:
 the Higher Party School and the Academy of Social Sciences.
 The former is placed under the jurisdiction of the Government
 of Union and the latter under the Department of Economics
 and Agriculture. The distinction made in this arrangement
 reflects the type of students receiving at these two differ-
 ent, higher institutions of communist study. To the
 Higher Party School, under the Department of Union, go the
 representatives of party and party, party executives, their
 men of influence, and key line.¹¹ To the Academy of Social
 Sciences go the technologists, scientists, and factory in-

3988-3989, 3990-3991, 3992-3993, 3994-3995, 3996-3997, 3998-3999, 4000-4001, 4002-4003, 4004-4005, 4006-4007, 4008-4009, 4010-4011, 4012-4013, 4014-4015, 4016-4017, 4018-4019, 4020-4021, 4022-4023, 4024-4025, 4026-4027, 4028-4029, 4030-4031, 4032-4033, 4034-4035, 4036-4037, 4038-4039, 4040-4041, 4042-4043, 4044-4045, 4046-4047, 4048-4049, 4050-4051, 4052-4053, 4054-4055, 4056-4057, 4058-4059, 4060-4061, 4062-4063, 4064-4065, 4066-4067, 4068-4069, 4070-4071, 4072-4073, 4074-4075, 4076-4077, 4078-4079, 4080-4081, 4082-4083, 4084-4085, 4086-4087, 4088-4089, 4090-4091, 4092-4093, 4094-4095, 4096-4097, 4098-4099, 4100-4101, 4102-4

such fields as government and law, international relations, logic and psychology.

In general, a Party member finds his own level in this schooling system. An agitator needs less grounding in Party doctrine than does a top leader or propagandist. A propagandist needs a firm grasp of such doctrine and an informed world view. An administrator needs a solid foundation in doctrine but also requires an understanding of his country's geography, economy, and political and economic system. A top leader or potential theorist who is to serve as "custodian of the sacred Bolshevik word" needs the most careful and continued training in all aspects of Bolshevik doctrine and practice. Any of the curricula may be supplemented by special training--military instruction for culture officers who are to serve with the armed forces; government accounting for appropriate personnel; practical experience in management and organization.

Thus educated, the Combat Party is uniformly well trained. The two-way channel of communication provided by the Department of Propaganda and Agitation insures that the Party is well informed as well. It is well disciplined and well controlled. In the totality of its program, it approaches its targets with every weapon that is available and appropriate--persuasion, infiltration, espionage, maneuver, blackmail, promise, threats; whatever is needed.

and these as government and law, international relations, logic and psychology.

In general, a party member finds his own level in this schooling system. An agitator needs this schooling in party doctrine then when a day leader in propaganda. A propagandist needs a firm grasp of such doctrine and its known basic view. An agitator needs a solid foundation in doctrine for this exercise in understanding of his country's geography, economy, and political and economic system. A day leader in political education who is to serve as "conductor of the school bellows" needs the same mental and spiritual training in all matters of propaganda doctrine and practice. Any of the curricula may be supplemented by special training—military instruction for outdoor officers and the to move with the armed forces; government accounting for agitators; personnel, practical experience in management and organization.

Thus selected, the Communist party is naturally self-organizing. The two-way method of communication provided by the department of propaganda and relations insures that the party is well informed as well. It is well disciplined and well coordinated. In the faculty of the program, it is to provide the teacher who must expect that in scientific and systematic—practical, intellectual, economic, technical, financial, physical, tactical, whatever is needed.

X. PRINCIPAL TARGETS

Soviet psychological warfare directs its operations against three principal targets outside of the Party itself.

The first of these is the main enemy himself. Here the approved tactics are pressure--diplomatic, economic, propaganda, and, as appropriate, military. The struggle is intense and the pressure exerted is maximum. Since the time of Lenin, Soviet leaders have warned against making anything less than a maximum effort, or exerting any less than maximum pressure.

A second target is that part of the enemy's power structure which is "ripe for the picking." This includes the areas of tension and dissatisfaction, the colonial countries, and the semi-feudal and underdeveloped countries, which are vulnerable to the communist approach. No matter how backward a country is, it is a worthwhile target. Every doubtful area must be seized, otherwise the enemy will do so. In assaulting targets of this kind, the organizational weapon of the Combat Party is unsurpassed. No advance is too small to be worthwhile. Yet the Party is warned not to expect to communize all of these lands in accordance with pure communist principles nor to expect the subversive process to be a rapid one.

The revolution of the colonies is not going to be a Communist revolution in its first stages In

Soviet psychological warfare during the operations against China in 1949, tactics similar to the early 1940s. The kind of work is the same today. The economic warfare and propaganda—information, economic, propaganda, and, as appropriate, military. The strategy is identical and the pressure exerted is similar. Since the late of World War II, Soviet leaders have turned against Soviet Russia less than a previous effort, or perhaps any less than previous programs.

A second target is that part of the world's population which is "free for the taking". This includes the areas of Eastern and Western Europe, the Western Hemisphere, and the South Pacific and undeveloped countries, which are vulnerable to the communist approach. No nation now possesses a monopoly of force, it is a worldwide struggle. Every country now must be subject to the communist approach. In assessing progress of this kind, the organizational system of the world today is unimpaired. Its progress is too small to be noticeable. Yet the world is being led to regard to community all of these areas as susceptible to the communist approach and to regard the worldwide struggle as a worldwide war.

The revelation of the policies is not going to be a complete revelation in the first stages. . . .

its first stages, the revolution in the colonies must be carried on with a program which will include many petty bourgeois reform classes, such as division of land, etc. But from this it does not follow at all that the leadership of the revolution will have to be surrendered to the bourgeois democrats.⁴¹

Thus, throughout Asia, the Combat Party offered a division of the land amongst the landless peasants; and when North Korea and China fell, such bourgeois arrangements as land reform were instituted. However, the Communist Party was firmly in charge, guiding the country on the desired course. All of the colonial, ex-colonial, and underdeveloped countries of Asia, the Middle East, Africa, and Latin America are regarded as targets for the Combat Party, which is willing to accept a small advance when a large one is not possible and which is constantly engaged in a war of organization, infiltration, and maneuver in an effort to split areas from the anti-Soviet power structure.

The third principal target is the Soviet mass. The struggle, in this case, is against what Lenin called that "terrible force" of values and behaviors built up in long years under capitalism. All external evidence indicates that the USSR Party leaders still feel that the Russian masses are swayed by the "bourgeois remnants of their past." The tight surveillance, the close control over communications,

⁴¹Cited by Schramm, op. cit., p. 126, from proceedings of the Second International Congress of 1920.

its first stages, the revolution in the colonies must be carried on with a program which will include many party, bourgeois reform classes, such as divided or united, etc. But this it does not follow at all that the leadership of the revolution will have to be transferred to the bourgeois leadership.⁴¹

Thus, throughout Asia, the Chinese Party offered a division of the land among the landless peasants; and when Marx wrote and China fell, some bourgeois revolutionaries in India were interested. However, the Communist Party was clearly in charge, pushing the country on the desired course. All of the colonial, semi-colonial, and underdeveloped countries of Asia, the Middle East, Africa, and Latin America are regarded as targets for the Communist Party, which is willing to accept a small amount when a large one is not possible and which is constantly engaged in a war of organization, infiltration, and subversion in an effort to split areas from the anti-imperial power structure.

The anti-imperial target is the Soviet Union. The struggle, in this case, is against what Lenin called that "parasitic layer" of Russia and against Lenin up in 1904. Lenin's anti-imperialism, all essential evidence indicates that the Soviet Party leaders still feel that the Russian masses are betrayed by the "bourgeois leadership of their party." The party revolution, the class control over revolutionary

⁴¹ "Toward a program, and all," p. 115, from program of the Second International Congress of 1920.

the "Iron Curtain" erected against external ideas and information, the vast program of agitation--all argue that the Party places considerably less faith than could be expected, after forty-three years of hegemony, in the doctrinal purity of its masses.

Each of these three targets is integral to the program of Soviet psychological operations and each is approached with the maximum effort permitted by the situation and available resources.

XI. COMMUNIST PSYCHOLOGICAL TACTICS

The strategic advantages of communism include (1) its historic plausibility, as that is bolstered by its relation to the Soviet Union, and (2) the instability of democratic society. In its quest for a monopoly of power, Bolshevik political strategy links a revolutionary elite to whatever social forces are set in motion against existing authority.⁴²

This statement penetrates to the heart of communist psychological tactics. Capitalistic society, like every other advanced society since the beginning of history, has certain areas of recurring tension. In their most severe manifestations, these tensions appear as wars, revolutions, or economic panics. In colonial or underdeveloped countries, in countries where one class or group feels discriminated against, in lands where people are hungry for food, land,

⁴²Selznick, op cit., p. 333.

the "Iron Curtain" against external ideas and influences. The vast program of education--all types from the Party schools consistently less with them could be mentioned, after Party-school years of hegemony, in the technical study of the masses.

Each of these three targets is integral to the program of Soviet psychological operations and each is approached with the maximum effort permitted by the situation and available resources.

VI. COMMUNIST PSYCHOLOGICAL TACTICS

The strategic advantage of communism includes (1) its tactical flexibility, as that is dictated by its relation to the Soviet Union, and (2) the inflexibility of domestic tactics. In its quest for a monopoly of power, Bolshevik political strategy finds a revolutionary ally in whatever social forces are set in motion against existing society.⁴²

This statement pertinent to the heart of communist psychological tactics. Capitalistic society, like every other advanced society since the beginning of history, has certain areas of security against its own most serious manifestations, those tensions against its own revolution, or economic progress. In contrast to underdeveloped countries, in countries where one class or group (as the bourgeoisie) is dominant, in lands where people are hungry for food, land,

⁴² Communism, an ally, p. 111.

freedom, or status, tensions exist which are highly exploitable. It is at this point that the communist operation begins. Perhaps the greatest tactical strength lies in the capacity to ground basic arguments in these real, deeply-felt, and well-known tensions. By using these tensions as a frame of reference, a basis for understanding is achieved. With a degree of credibility established, the operations proceed using two additional advantages to broaden the scope of operations. The first of these is that a democratic society permits attacks on itself, encouraging its citizens to propose change and protecting minority viewpoints even though they may be inimical to the regime. The second advantage draws from the fact that in Soviet countries some evidence of the historic plausibility of communism as a cure for those tensions may be cited. The price of this cure in terms of terror, fear, and surrender of freedom and human dignity is not so clear and spectacular outside a sovietized country as is the need and apparent accomplishment.

The basic tactic, then, is to ground the operation of the Combat Party in real and generalized tensions throughout the world.

It is necessary to render genuine oppression even more severe by adding to it the consciousness of oppression, and to make shame even more shameful by throwing upon it the light of publicity.⁴³

⁴³Cited in Domenach, op. cit., p. 266, from the works of Karl Marx.

...of states, relations with which are closely con-
 siderable. It is at this point that the communist operation
 begins. Perhaps the greatest tactical strength lies in the
 capacity to ground itself on events in those years, ready-
 felt, and well-known factors. By using these factors as a
 frame of reference, a basis for understanding is achieved.
 with a degree of reliability established, the operations
 proceed using the traditional advantage to further the scope
 of operations. The first of these is that a domestic
 society tends to attack on itself, encouraging its citizens
 to oppose change and protecting minority viewpoints even
 though they may be harmful to the regime. The second
 advantage derives from the fact that its most numerous and
 evidence of the historic plasticity of communism as a cure
 for those factors may be seen. The price of this cure in
 terms of better, less, and expenditure of lives and human
 dignity is not so clear and spectacular outside a revolution
 country as in the past and appears accordingly.
 The basic factor, then, is to ground the operation of
 the Communist Party in real and generalized terms throughout
 the world.
 It is necessary to render genuine opposition even more
 aware by adding to it the consciousness of operations,
 and to make them even more shameful by showing them
 in the light of reality.⁴²

⁴² cited in document, op. cit., p. 255, from the words
 of Karl Marx.

Lenin applied this guidance by assigning to the Party the task of organizing those ". . . political revelations, embracing all spheres . . . [which] . . . are the necessary and fundamental condition to preparing the masses for their revolutionary activity."⁴⁴

This is a mandate to the propagandist and agitator to examine events in the light of Marxist-Leninist doctrine and, in the terms of the reality of class struggle, to interpret the "real meaning" of events to the masses. Invariably following the basic tactic, the campaign begins with details which are, or seem, verifiable and which are often of a very small irritative nature and interprets them on a grand scale. A political scandal, and unwise statement by a public official, a desire to bring the young men home from military service early, a fear of nuclear fallout--any of these can provide impetus for the Party to begin to work its way along the inverse spiral of a propaganda campaign from the specific to the general doctrinal meaning, so as to "tear the mask from the face of the enemy."

In this activity, slogans become one of the chief tactical weapons of the agitator.

We are accused of creating mass opinion. This reproach is inexact; we are attempting only to formulate it . . .

⁴⁴Vladimir Ilyich Lenin, Selected Works (New York: International Publishers, 1935), pp. 1 and 22.

Lenin applied this program by assigning to the Party the task of organizing those of the political revolution, organizing all spheres of activity, and the necessary and fundamental condition for preparing the masses for their revolutionary activity.²²

This is a mistake in the propagandist and agitator to assume events in the State of Soviet-Leninist doctrine and the basis of the society of class struggle, to indicate the "real condition" of events in the masses. The usually following the Leninist basis, the Russian people with details which are, on some occasions and which are often of a very small fraction of the whole and which have on a great scale. A political condition, the Leninist program by a public official, a desire to bring the Party and State from military service early, a lack of military training—any of those can provide income for the Party to bring to light its way along the Leninist program of a propaganda campaign. From the question to the country's political condition, he is to "then the work from the work of the Party."

On this program, the Leninist program of the Party, the Leninist program of the Party.

We are not to be misled by the Leninist program. This program is necessary to be understood only in the Leninist program.

²²Lenin, *Selected Works*, (New York: International Publishers, 1913), Vol. I, pp. 1 and 11.

the slogans which correspond to the acute need of a class and epoch themselves create thousands of channels for their own dissemination. The revolutionary milieu is marked by a high conductability of ideas.⁴⁵

"Land and Peace," "bread, peace, and liberty," "for a liberal, democratic government," "Ban the bomb"--these represent some of the most successful of all the Bolshevik slogans. One of the great strengths of peace campaigns and appeals is the endless reiteration of the single word "Peace," which means "so many things to so many people and recalls so many of the bruises and hurts of society the world over."⁴⁶ Lenin emphasized the importance of grounding all slogans in the needs and tensions of the masses and the requirement for clarity and brevity in expressing the political line of the moment. Every slogan must appeal as broadly as possible to the deepest wishes of the common people.

Probably no propagandists have made such use, nor had the opportunity to make such use, of repetition and variation as have the communists. There are hundreds of different kinds of newspapers and magazines throughout the USSR, each saying the same thing, but translating it into the experience, the words, and the known tensions of the particular audience which the publication serves. Throughout the world,

⁴⁵ Cited in Domenach, op. cit., p. 268, from the works of Leon Trotsky.

⁴⁶ Schramm, op. cit., p. 132.

the slogan which corresponds to the needs of the
class and epoch themselves create themselves of them-
selves and their own situation. The slogan
itself is marked by a high contentuality of ideas.⁴⁵

"land and freedom," "bread, peace, and liberty," "for a

liberal, democratic government," and the "bourgeois rep-

resentative of the most successful of all the bourgeois

slogans. One of the great slogans of peace campaigns and

slogans is the entire collection of the slogan word

"Peace," which means "no more things to be made peace and

peace to many of the business and needs of society. The

word itself."⁴⁶ Lenin explained the importance of promoting

all slogans in the needs and demands of the masses and the

requirement for clarity and brevity in expressing the politi-

cal line of the moment. Every slogan must appear as clearly

as possible to the deepest masses of the common people.

Probably no propagandists have made such use, and had

the Combat Party devotes extraordinary care to fitting its activities into the culture where its objectives lie. The leader of a unit of the Party in India is certain to be an Indian. When the Party moved into North Korea, a large cadre of Russian-trained Koreans were ready to take over leadership. When the North Korean troops advanced into South Korea, they brought with them another cadre of South Koreans who had been trained in China and North Korea to take over the South Korean government at the appropriate time. Behind Mulah Barzani of the Kurds and Khalid Backdash of the Syrians stands the parent Party, while the variation in terms of the audience, the cultural approach, and the acceptability of the local apostle of the new faith is a matter of the closest attention.

Since Lenin, Soviet Party leaders have cautioned against "adventurism" in carrying the attack to the enemy. The admonition against undertaking an action when the resources are inadequate to carry the project off successfully seems to apply to psychological operations as well as to the field of military activity. The Party strives continually to maintain the psychological initiative by carefully choosing the time, place, and issues. This doctrine of attack is another key to the Party's psychological strategy. "The tactic is constant attack--seldom answering, seldom

the Korean Navy Reserve School, which is being de-activated into the Korean Navy Reserve School. The transfer of a unit of the Navy in Korea is certain to be an Indian. When the Navy moved into North Korea, a large number of Korean-trained soldiers were sent to take over the training. When the North Korean forces advanced into South Korea, they brought with them a number of South Korean soldiers who had been trained in China and North Korea. Even the South Korean government at the time of the Korean War, which was the end of the Korean War, was the result of the Korean War, while the transfer of the Korean War to the present day, while the transfer in terms of the situation, the cultural situation, and the independence of the local people of the new state is a matter of the closest attention.

Since then, Soviet and American leaders have continued against "adventurism" in carrying the attack on the enemy. The American people understand as well as the Korean people are interested in carrying the subject of successfully being to apply to psychological operations as well as to the field of military activity. The latter studies especially to maintain the psychological initiative by carefully choosing the time, place, and issue. This doctrine of attack is another key to the Navy's psychological strategy. The result is a constant attack--action, movement, action.

defending, always changing the field of battle to one of its own choosing."⁴⁷

Lenin emphasized that the Party must be ready to adopt itself to changing conditions. The Party has continually been counseled to expect setbacks or temporary deviations from the long-term path and to be prepared for deals and alliances, also temporary, with enemies. This ability to make a quick shift is in accord with basic political doctrine and planning; it also parallels the pattern of anxiety and fatigue tactics which communists are reported to employ in obtaining "confessions." Some students detect in the "quick shift" the potential element of a truly grand tactic based on the same psychological approach.⁴⁸ It is highly credible that when the tension of a particular psychological attack has been raised to a sufficient degree, the Soviet psychological strategists deliberately give the target temporary relief from that tension in order to teach a desired response and, gradually, through a succession of such build ups, inexorably break down the resistance of the enemy.

Party psychological strategists recognize that many of their most likely converts are individuals who feel rejected by the society around them or whose values are in

⁴⁷Ibid., p. 133.

⁴⁸Wilbur Schramm submits that the parallel is sufficiently striking to warrant serious study.

own recording."

It is also noted that the person who was interviewed is well-versed in the subject matter.

flux, and who are looking for firm ideological guidance. Consequently, wherever the Combat Party operates in the world, it provides groups in which a convert can reinforce his new beliefs and establish an identification with a working organization which will give him a sense of mission, status, and a sense of belonging.

XII. THE CONCEPT OF TOTAL ATTACK

The Soviet view of psychological war and psychological operations is a concept of total attack. The Party trusts no one it does not dominate. Its opponents can expect a consistently suspicious attitude toward everything that is said or done. This attitude is not an assumed defense mechanism but is the predictable heritage of Russian history and Party experience and doctrine. There is little cause to regard any settlement offered or entered into by the USSR as a permanent arrangement, for communist doctrine demands its abrogation as soon as it has served its intended purpose.

While the Party is flexible in its line and political arrangements, it never deviates far from the center of its pre-surveyed path. Every step taken is directed along the trend of this path and every step is a move in a war of maneuver. The Combat Party works in every part of the world where it can gain or force entrance and is engaged in a

...and a sense of belonging.

1. The Soviet view of psychology was not psycholog-
ical operations is a concept of total system. The theory
exists no one is found and knowledge. Its operations can be
based on objectively, systematic scientific power regarding
what is said to them. This science is not an answer
without evidence and is the scientific basis of human
history and early experience and doctrine. There is little
need to regard any movement offered or entered into by
the state as a permanent arrangement, for communist doctrine
dominates its organization as soon as it has served its intended

While the party is flexible in its line and political arrangements, it never deviates far from the center of the non-aligned path. Every step taken is dictated along the line of this path and every step is a move in a war of maneuver. The United Party wants to every part of the world where it can gain or force influence and is engaged in a

program of organization, indoctrination, infiltration, and maneuver. It maintains an atmosphere of tension, utilizing every source of potential dissatisfaction, and constantly applying pressure.

From its own activities, the Party knows the dangers of infiltration, and it knows the vulnerability of the masses. It also harbors very real concern for its own masses which it considers still to be "contaminated" from life under the old regime; this concern becomes increasingly more active with the inclusion of satellite peoples within the horizons of Soviet hegemony. The existence of the Iron Curtain, the Berlin Wall, and the adamant refusal to consider effective, on-sight, inspection teams as part of an arms control settlement are not surprising. What would be surprising would be a willing removal of these obstacles. Should this occur, it might indicate that the masses were at last considered safe, or that the Party was a different Party than heretofore, or that, in the estimate of Soviet planners, there was no escape, no way out, and nothing further to be feared from the non-Soviet world.

The Western World cannot afford to overlook Nikita Khrushchev's statement in Tirana, Albania, in May of 1959.

We do not negotiate on the basis of "give and take."
We have nothing whatsoever to give. We will not

[illegible]

...from the ... the very ... the ...

advertising would be a willing removal of these obstacles. These control mechanisms are not fulfilling. They could be either restrictive, on-alright, suspension laws as part of an embargo, the tariff walls, and the demand removal to non-foreign nations as under hegemony. The existence of the Iron Horse nation with the intention of universal people within like under the the regime, this country imposed increasingly raised which is consistent with its "communist" from

Specifically, the Bureau is being advised that the records were at that time in the hands of the FBI, and that the FBI was a different entity than the Bureau, or that, in the opinion of the Bureau, there was no escape, no way out, and nothing to be done from the standpoint of the FBI.

CHAPTER IV

THE DEVELOPMENT OF UNITED STATES PSYCHOLOGICAL OPERATIONS

American history, since before the Revolution, is sprinkled with the recorded use of psychological operations. In some cases, this employment was sufficiently protracted and sufficiently integrated to approach the dimensions of psychological warfare. In the young days of the Republic, the moralistic undertone to American pragmatism was rarely allowed to stand in the way of results. Furthermore, the demanding immediacy of dealing with the day-by-day conquest and exploitation of the virgin land left insufficient time for the "native hue of resolution . . . [to become] . . . sicklied o'er with the pale cast of thought." So long as the nation lived with the frontier or with a majority of a population whose recollections were filled with the actual or near actual experiences of opening a continent, conscience made cowards of very few indeed.

I. SOURCES OF AMERICAN AVERSION TO THE USE OF PSYCHOLOGICAL OPERATIONS

Any recognized aversion to the use of psychological operations in the formative years of the Republic probably stemmed from three basic sources. American military

CHAPTER IV

THE DEVELOPMENT OF THE PSYCHOLOGICAL
CONCEPTS

American history, since before the Revolution, is
saturated with the recorded use of psychological operations.
In some cases, this employment was sufficiently precise
and sufficiently intensive to approach the diagnosis of
psychological warfare. In the young days of the republic,
the earliest reference to American operations was rarely
allowed to stand in the way of results. Furthermore, the
constant tendency of dealing with the day-by-day conduct
and exploitation of the virgin land left unattained the
for the "native use of resources" . . . (no names) . . .
which was also the last word of knowledge. So long as
the nation lived with the frontier or with a majority of a
population whose recollections were filled with the actual
or best actual experience of opening a continent, consequence
was bound to be very few indeed.

1. HISTORY OF AMERICAN OPERATIONS TO THE
USE OF PSYCHOLOGICAL OPERATIONS

Any recognized reference to the use of psychological
operations in the various years of the Republic properly
should first show their sources. American military

tradition sprang from Europe where it was considered much more "fitting and proper" to be shot to pieces assaulting a redoubt than to stand back and talk the defenders into surrendering. The latter performance was not cowardly, exactly, but it certainly was not a method susceptible to embellishment in the mess. The earliest basis of illegitimacy lies here.

Immediate results, drawing from an evaluation of concrete facts, were the goals of American operators of all kinds. This is still an American hallmark. The nebulous, ill-defined realm of public opinion, the impact of symbols, the role of ideology—all of these were too distant, too unsubstantial for the American style of taming a country; lack of means of rapid, mass communications only served to relegate such methods to an even lower priority. Consequently, the effectiveness of psychological operations as a tool of policy never approached the proven worth of the Minié ball. There developed, therefore, no national basis for confidence in the employment of psychological operations.

Suspicion of authority and a parallel determination to compartmentalize all authority into legally controllable units provided with powers shared with and, thereby, balanced by other competing units have been features of American political consideration since 1787. In this context, reflective thought on the nature of psychological operations early

discovers the threat of subversion of one organizational unit by another through the employment of a force which can leap the barriers of law and a carefully balanced set of checks and balances. This potential strikes at the heart of American constitutionalism and gives rise to the "round house" statement, so frequently used to dismiss its use: that psychological war is "antithetical to the American way of life."¹ The habitual objection to its employment has been the inference that psychological operations are not consonant with either the past experience or the present-day interests of the nation.

When forced to resort to arms for redress, an appeal to the tribunal of the world was deemed proper for our justification. This was the object of the Declaration of Independence. Not to find out new principles, or new arguments, never before thought of, not merely to say things which had never been said before; but to

¹A "round house" statement is, by definition, a verbal refuge where it is difficult to be cornered. The tone of contemporary reference to that diaphanous web spun of mores, values, style, heritage, and image of America and her people is a distressing fact of American political writing. A search for the stage in our national life when the aforementioned terms ceased to be employed as reasons for acting and became excuses for not acting at all or in an ineffective way might be most enlightening. Perhaps there is validity in the observation that America has ceased to be a Father-land and has become a Mother-land: that the idiosyncratic feature of the American conscience is that it is predominantly feminine. Perhaps, also, the old naval shibboleth that "things aren't like they were in the old Navy--and besides they never were" is also applicable. Nonetheless, the Hamlet pattern is discernible in our quest for moral strength and guidance.

place before mankind the common sense of the subject, in terms so plain and firm as to command their assent and to justify ourselves in the independent stand we are compelled to take. Neither aiming at originality of principle or sentiment, nor yet copied from any particular or previous writing, it was intended to be an expression of the American mind, and to give to that expression the proper tone and spirit called for by the occasion.²

Thus, what has come to be one of the documents of the American spirit was first and foremost a propaganda tract. It was effective as a psychological instrument not only because of its powerful annunciation, but because its moral suasions were supported by action which clearly demonstrated that Americans had the strength of their convictions.

II. EARLY INSTANCES OF AMERICAN PSYCHOLOGICAL OPERATIONS

Both Franklin and Jefferson were involved in a large-scale psychological operation against the Hessian mercenaries. Their "Plan to Cause Hessian Desertions" was an early example of the necessity for high-level political support as a prerequisite to successful psychological warfare. Without a congressional resolution authorizing protection, citizenship, and up to one thousand acres of land, depending upon the rank of the deserter, the program could never have been

²Cited by Oren Stephens, Facts to A Candid World (Stanford: Stanford University Press, 1955), p. 29, from a letter to Henry Lee, May 8, 1825, written by Thomas Jefferson.

place before making the same form as the subject, in terms of this and this as to content itself. And to justify ourselves in the independent stand we are compelled to take. Neither aiming at objectivity of analysis as such, nor yet trying to be objective as previous writing, it was intended to be an expression of the human mind, and to give to each reader the power to see and think as he pleased by the occasion.

Thus, what was done to be one of the documents of the American spirit was first and foremost a propaganda piece. It was effective as a psychological instrument not only because of its powerful announcement but because its words were supported by action which clearly demonstrated that Americans had the strength of their convictions.

II. EARLY HISTORY OF AMERICAN

PSYCHOLOGICAL ORIENTATION

Both Franklin and Jefferson were involved in a large-scale psychological operation against the British empire. Their "Plan to Create Mental Revolution" was an early example of the necessity for high-level political thought in a propagandistic or successful psychological warfare. A psychological revolution suggesting revolution, dissent, and up to one thousand years of time, depending upon the rank of the detractor, the process could never have been

¹ "The Great American, From a Communist Point of View," *Harvard University Press*, 1957, p. 15. From a lecture by Henry Lee, May 2, 1955, written by Thomas Jefferson.

carried out. It has been estimated that between five and six thousand men deserted as a result.³ Since this represented 20 per cent of the Hessian force, the success of the venture was obvious.

The use of psychological operations, therefore, is grounded in the very founding of the nation. The individuals involved certainly did not believe they were engaged in any sinister or unethical action.

The United States army encountered very effective psychological operations by the Mexicans during the Mexican War. A forceful religious appeal, an offer of citizenship, and 320 acres of land addressed to U. S. soldiers of foreign birth, particularly the Irish Catholics, had marked effect. The majority of the deserters were Irishmen who had become convinced by Mexican propaganda that they were on the wrong side in a religious war. These men formed the core of the San Particio Battalion of U. S. deserters in the Mexican Army. Most of the heavy American losses sustained in the seizure of Churubusco were attributed to the skill with which the Mexican cannon were served by members of this battalion.

Sixty-nine members of the battalion were captured at Churubusco. Those who had deserted prior to the declaration

³Douglas Southall Freeman, George Washington (New York: Charles Scribner's Sons, 1951), Vol. III, pp. 517-518.

German side. It was then believed that between five and six thousand men deserted as a result. About this number is not sure of the German figures, the account of the German side is different.

The use of psychological operations, therefore, is provided in the very founding of the nation. The latter-mentioned operations, however, did not believe they were engaged in any kind of tactical action.

The latest German army instructions very clearly state psychological operations by the Germans during the war. A tactical mission report, as noted in this report, and 100 acres of land addressed to 500 soldiers on foreign soil, particularly the Latin American, had marked effect. The majority of the soldiers were Italian who had become convinced by German propaganda that they were on the way to a new religion. These are formed the core of the German military mission of U.S. operations in the Middle East. Most of the heavy American losses resulted in the hands of the Germans were attributed to the fact that the German command was never by means of this

mission. The German command was never by means of this mission. Those who had believed that the German command was never by means of this mission.

of war were flogged and branded on the cheek with a "D." Fifty were hanged, the last thirty of which were executed in sight of the actual storming of Chapultepec, having been "let live long enough to see the flag raised on the castle."⁴

The failure of the U. S. Army to develop an effective counter propaganda program presaged a similar failure to counter the strong ideological approach used by the Communists against American soldiers in Korea a century later.

III. LINCOLN'S EMANCIPATION PROCLAMATION

The composition and timing of the Emancipation Proclamation places it in a category with the Declaration of Independence as one of the classic feats of American psychological operations. Lincoln was under attack from the Northern Abolitionists to which he replied that his "paramount object in this struggle . . . [was] . . . to save the Union, and . . . [was] not either to save or to destroy slavery."⁵ In formulating his proclamation, he had to consider the effect of such an instrument not only on the Northern Abolitionist, but also upon the white population of

⁴ Marshal Andrews, "Psychological Warfare in the Mexican War," A Psychological Warfare Case Book, William E. Daugherty and Morris Janowitz (eds.) (Baltimore: Johns Hopkins Press, 1958), pp. 72-73.

⁵ J. G. Randall, Lincoln The President (New York: Dodd, Mead, and Co., 1945), Vol. II, p. 158.

of war were flooded and broadcast on the streets with a 10-15
 fifty were changed, the last thirty of which were executed in
 sight of the crowd according to Chapultepec, having been
 "let have long enough to see the flag raised on the castle."
 The failure of the U. S. Army to develop an effective
 counter propaganda program presented a similar failure to
 counter the strong ideological speech used by the Commu-
 nists against American soldiers in Korea a century later.

III. LINCOLN'S EMANCIPATION PROCLAMATION

The composition and timing of the Emancipation Proclamation
 is a subject of controversy. It is a subject with the history of
 independence as one of the classic tests of American psycho-
 logical organization. Lincoln was under attack from the
 Northern Abolitionists to which he replied that his ques-
 tion was not in this struggle . . . (Lincoln) . . . to save the
 Union, and . . . (Lincoln) not asked to save or to destroy
 slavery.⁶ In formulating his proclamation, he had to con-
 sider the effect of such an instrument not only on the
 Northern Abolitionists, but also upon the white population of

⁶Harold J. May, "Psychological Warfare in the
 Mexican War," *A Psychological Warfare Case Book*, edited by
 Randolph and Joseph J. May (New York: McGraw-Hill, 1955), pp. 12-13.

⁷J. G. Randall, *Lincoln the President* (New York:
 Doubleday, 1955), pp. 12-13.

the Confederacy; the slave population of the Southern States; the white population of the Slave States still on the side of the North; those Northerners who were opposed to challenging Southern slavery; and, last, the British, whose government was seriously considering recognizing the Confederacy as an independent state. The record of these considerations indicates that the last factor ranked in the forefront. Many Americans were convinced that only when the rebellion was officially declared to be a war between slavery and individual freedom as well as one against disunion would the British be placed upon such morally thin ice that they would be forced to cease threatening the Union through their thinly-veiled support of the Confederate States.

The proper psychological moment to issue the proclamation was a matter of great importance. Improperly timed, the effect could have been one of "whistling in the dark" or, as Secretary Seward phrased it, "a last shriek on the retreat."⁶ The Federal victory at Antietam provided the opportunity.

The wording of the document was military and non-abolitionist in flavor. It opened with a declaration that reunion (not abolition) was the object of the war and later stated that it was warranted by the Constitution upon military necessity. This suggestion of military expediency was

⁶Ibid., pp. 155-156.

inserted as an attempt to vitiate ideological reactions in both the North and the South.

The proclamation placed the North on the side of humane progress. It retained "the 50,000 bayonets" of the slave-holding states still loyal to the Union. It aroused such popular support in England that the British Government could no longer consider overt support of the Southern States. As an instrument of psychological warfare, it has been ranked with the Declaration of Independence and the Fourteen Points.

IV. ROOSEVELT AND THE GREAT WHITE FLEET

By 1907, America had begun her emergence into the broader scope of the world stage and was encountering some of the difficulties that accompany such a role. America's popularity in Japan declined precipitously following the conclusion of the Treaty of Portsmouth and as a result of the State of California's discriminatory actions against Japanese immigrants. Newspaper sensationalism and political agitation had created a full-blown issue in the American West, while public Japanese disappointment over the absence of a Russian indemnity, a feeling that America had tried to deprive Japan of the full reward of victory, and outrage over the treatment of Japanese nationals in America combined to produce widespread ill will and anti-American riots in

insisted as an attempt to violate ideological reactions in both the North and the South.

The proclamation placed the North on the side of human progress. It retained the 50,000 bayonets of the slave-holding states still loyal to the Union. It stressed such popular support in England that the British Government could no longer consider overt support of the Southern States. As an instrument of psychological warfare, it has been ranked with the Declaration of Independence and the Foreman trial.

IV. ROOSEVELT AND THE GREAT WHITE FLEET

By 1907, America had begun her emergence into the broader scope of the world stage and was encountering some of the difficulties that accompany such a role. America's popularity in Japan declined precipitously following the conclusion of the Treaty of Commerce and as a result of the issue of California's discriminatory section against Japanese landowners. Newspaper sensationalism and political agitation had created a full-blown issue in the American West, while public opinion disapproved even the absence of a Russian indemnity, a feeling that America had tried to divert Japan of the full reward of victory, and thereby over the treatment of Japanese nationals in America combined to produce widespread ill will and anti-American state in

Tokyo. It was very clear that Japan had emerged as a world power, equal, in military strength, to France of that day; in a dominant position in the Far East; and possessed of an imperialistic drive and hunger. Roosevelt was both conciliatory and pacific. He was outraged by the California action and feared that in the aftermath of a successful war, public opinion in Japan might actually force the government, over its own better judgment, to take up arms in defense of national honor.

I am exceedingly anxious to impress upon the Japanese that I have nothing but the friendliest possible intentions toward them, but I am none the less anxious that they should realize that I am not afraid of them and that the US will no more submit to bullying than it will bully.⁷

The world cruise of the White Fleet, 1907-1909, was the tactic decided upon. The psychological implications were varied. It was directed inward toward the American people themselves. No comparable fleet had ever rounded Cape Horn before, and the accomplishment of such a maneuver would have great domestic impact. The voyage would formally announce to the world the fact of American interest in the Pacific with a simultaneous demonstration of the power available to protect that interest. It certainly was intended to deter the Japanese militarists from any over-hasty

⁷Cited by Thomas A. Bailey, A Diplomatic History of the American People (third edition; New York: Appleton-Century-Crofts, Inc., 1946), pp. 571-572.

Tokyo. It was very clear that Japan had achieved a world power, equal in military strength to France of that day, in a dominant position in the Far East, and possessed of an important share in Europe. Moreover, her past colonialism and her position as a world power had been developed by the Japanese nation and based upon the strength of a modernized way of public opinion in Japan which actually forced the government over its own better judgment, to take up arms in defense of national honor.

I am exceedingly anxious to forget upon the Japanese that I have nothing but the friendliest possible intentions toward them, and I am sure that they will not fail to realize that I am not afraid of them and that the US will do more than to maintain the peace.

The world crisis of the White Fleet, 1897-1900, was the factor decided upon. The psychological implications were varied. It was directed toward the American people themselves, to emphasize that they were now a world power, and the recognition of such a power would have great domestic impact. The voyage would formally announce to the world the fact of American interest in the Pacific with a simultaneous demonstration of the power available to protect that interest. It certainly was intended to deter the Japanese Alliance from any over-hasty

¹Quoted by Thomas A. Bailey, *A Diplomatic History of the American People* (New York: Appleton-Century-Croft, Inc., 1948), pp. 271-272.

decisions. This action was an excellent psychological operation. Its results were carefully calculated, the operations were well executed, and its effect was decisive.

The conduct of American psychological operations prior to World War I, although on occasion quite effective, was sporadic and ad hoc in nature. In the light of present-day definitions of psychological warfare, these activities would certainly fall under the purview of agencies or advisers assigned the task of coordinating the nation's activities in the fields of diplomacy, military operations, and economics. Such, of course, was not the case. The situations requiring such action generated the need which produced a practical solution based upon an analysis of the known or suspected variables. There was no coordinating machinery for a continual sifting of the inputs. There was no organization to study the effect of long-range trends. The world was a much larger globe in those earlier years. Distance, slow travel, and the absence of the means for high speed, long-range and mass communications were obstacles in the path of any effective, large psychological campaigns. When compared to the wide scale and long-term nature of that integrated series of operations which is connoted by the term "psychological warfare," it is probably correct to regard these earlier examples as psychological operations.

decisions. This factor was an essential psychological
 operation. Its results were necessarily calculated. The
 operations were well executed, and the effect was decided.
 The conduct of American psychological operations
 prior to World War I, although on occasion quite effective,
 was sporadic and ad hoc in nature. In the light of present-
 day definitions of psychological warfare, these activities
 would certainly fall under the purview of operations on an
 international scale. The task of coordinating the nation's
 activities in the fields of diplomacy, military operations,
 and economics, and, of course, was not the case. The
 activities regarding such action pertained to the field of
 operations. A practical solution based upon an analysis of the
 known or suspected variables. There was no coordinating
 necessary for a coordinated effort of the inputs. There was
 no organization to study the effect of long-range results.
 The world was a much larger globe in those earlier years.
 Distance, air travel, and the abundance of the means for high
 speed, long-range and mass communications were obstacles in
 the path of any effective, large psychological campaign.
 When compared to the wide world and long-term nature of today
 increased levels of coordination which is required by the
 term "psychological warfare," it is probably correct to
 regard these earlier activities as psychological operations.

V. AMERICAN PSYCHOLOGICAL WARFARE

EFFORTS IN WORLD WAR I

World War I witnessed psychological operations transformed from an incidental to a major instrument of national policy. In fact, the post-war period of the 1920's saw the Germans lauding American psychological warfare and counting it as a major factor of defeat. If psychological warfare is considered in the broadest sense, it is true that it was among the decisive instruments. The political policies of the Allies, the appeal of Wilson's Fourteen Points, the obsolescence of the German Imperial system, and the resurgence of Eastern European Nationalism all played important roles in forcing Germany to surrender. However, it must be remembered that following the War, German apologists seized on every pretext to convince the world, and themselves, that their surrender had been due to everything but a military defeat. Therefore, one must be wary of any German evaluation of the efficacy of the American psychological effort.

Propaganda came into prominence in World War I because the nations involved had already made mass communications part of their daily lives. It was inevitable that such civilian developments as huge newspapers, systematic advertising, calculated political publicity, and other forms of opinion manipulation would be integrated into the governmental programs. It followed, naturally, that the

THE AMERICAN PSYCHOLOGICAL WARFARE

REPORT IN 1945

World War I witnessed psychological operations from
 toward from an incident to a major instrument of national
 policy. In fact, the post-war period of the 1950's saw the
 German leading American psychological warfare and covering
 it as a major factor of defeat. It psychological warfare is
 considered in the broadest sense, it is true that it was
 among the decisive instruments. The political policies of
 the Allies, the appeal of Wilson's Fourteen Points, the
 characteristics of the German Imperial system, and the inter-
 germs of Eastern European nationalism all played important
 roles in leading Germany to surrender. However, it must be
 remembered that following the war, German scientists seized
 on every pretext to condemn the world, and themselves, that
 their surrender had been due to everything but a military
 defeat. Therefore, one must be wary of any German evalua-
 tion of the efficacy of the American psychological warfare.
 Propaganda came into prominence in World War I be-
 cause the nations involved had already made vast communica-
 tions part of their daily lives. It was inevitable that
 such civilian developments as mass movements, systematic
 advertising, calculated political publicity, and other forms
 of opinion manipulation would be introduced into the govern-
 mental programs. It followed, naturally, that the

psychological warfare effort of each of the belligerents was the direct derivative of peacetime, non-political advertising patterns.

The American psychological warfare effort of 1917 to 1919 was no exception and drew heavily on familiar skills. Soon after the entrance of the United States into the war, President Wilson appointed a Committee on Public Information. This committee--known as the Creel Committee--was composed of the Secretaries of the Navy, State, and War Departments with Mr. George Creel as chairman. This was equivalent to appointing a separate cabinet member for psychological warfare; and Mr. Creel was responsible for every aspect of propaganda work, both at home, and abroad. One result of this method of organization was to confer upon the overseas representatives of the committee something of the prestige of the three great Government Departments. The Creel Committee enjoyed a tremendous advantage in the person of the chairman, George Creel. Creel was highly regarded by the President, enjoyed his complete confidence, and had direct access to him. Creel's participation in national policy formulation was, therefore, at a sufficiently high level to provide propaganda coordination to other governmental policies on a credible basis.

The Creel view was that previous wars had been purely physical struggles in which public opinion was of no

psychological warfare effort of each of the defendants and the direct objective of psychological, non-political subversion against them.

The American psychological warfare effort of 1919 to 1920 was no exception and drew heavily on similar skills. Soon after the entrance of the United States into the war, President Wilson appointed a Committee on Public Information. This committee--known as the Creel Committee--was composed of the secretaries of the Navy, State, and War Departments with Mr. George Creel as chairman. This was equivalent to appointing a separate cabinet member for psychological warfare and Mr. Creel was responsible for every aspect of propaganda work, both at home, and abroad. One result of this method of organization was its center upon the overseas representation of the committee consisting of the principle of the United States Government Department. The Creel Committee enjoyed a prominent advantage in the person of the chairman, George Creel. Creel was highly regarded by the President, enjoyed his complete confidence, and had direct access to him. Creel's participation in national policy formulation was, therefore, at a sufficiently high level to provide propaganda coordination to other governmental policies on a credible basis.

The Creel idea was that previous wars had been purely physical struggles in which public opinion was of no

importance, whereas World War I was primarily a test of strength between opposed ideals, with "moral verdicts" having as much significance as military decisions. "It was . . . [a] fight for the minds of men, for the 'conquest of their convictions,' and the battle line ran through every home in every country."⁸

The Creel Committee was created to conduct this psychological struggle both at home and abroad. Creel himself considered this task to be one of advertising. His book, How We Advertised America, explained in great detail his efforts and, by its title, indicated the principal shortcoming of the American effort.

The Creel Committee was loosely organized and was run in a simple, almost chaotic, fashion. Agencies proliferated whenever a new idea turned up. The basic concept was that of domestic American agitation as practiced, commercially, through advertising and, socially, through the civic clubs.⁹

A news bureau in Washington was established which supplied material to the domestic and international commercial press and processed other material to publicity missions abroad. Missions were sent to France, England, Italy,

⁸George Creel, How We Advertised America (New York: Harper and Bros., 1920), p. 3.

⁹Paul M. A. Linebarger, Psychological Warfare (second edition; New York: Duell, Sloane, and Pearce, 1960), p. 68.

importance, whereas world war I was primarily a test of
strength between opposed ideals, with "social instincts" hav-
ing as much significance as military decisions. "It was
... [a] fight for the minds of men, for the 'conquest of
civilization', and the battle line ran through every
home in every country."⁶

The Great Committee was created to conduct this psy-
chological struggle both at home and abroad. Great himself
considered this task to be one of advertising. His book,
How We Advertised America, explained in great detail his
efforts and, by its title, indicated the principal short-
coming of the American effort.

The Great Committee was loosely organized and was run
in a haphazard, almost chaotic, fashion. Agencies proliferated
throughout the war and continued. The basic concept was that
of Americanization of opinion as practiced, commercially,
between advertising and, essentially, through the civic clubs.⁷
A new bureau in Washington was established which

supplied material for the domestic and international commu-
nial press and processed other material for publicity mis-
sions abroad. Missions were sent to France, England, Italy,

Edition, New York: Doubleday, 1961, p. 43.

Switzerland, Holland, Spain, Scandanavia, the Latin American countries, China, and Russia. The Japanese were given the American propaganda file and were asked to use it. Heavy emphasis was placed on the home audience, for the committee's mission covered all phases of propaganda work. Sections were established for posters, advertising, "Four Minute Men" (volunteer local speakers in all American communities), films, American minority groups and the foreign-language press, women's organizations, information bureaus, syndicated features, and cartoons. The American motion picture industry was employed as a channel for domestic and foreign distribution of American propaganda. Foreign countries, unwilling to run the propaganda films, found that the American producers would not supply any feature productions.

It was hardly an exaggeration to say that no special machinery had to be built up for the conduct of operations. The major task was more one of coordination and guidance. The extent of voluntary contribution was amazing.

The Pamphlet Division commanded the services of any writer it chose to call, and it had ready access to over three thousand of the leading historians of the country. Novelists, essayists, and the publicists, without payment, worked in the production of articles for syndicated distribution. The objective of the Division of Syndicate Features was "to sell the war" to the people and to present in

Switzerland, Holland, Spain, Scandinavia, the Latin American countries, China, and Russia. The Japanese were given the American propaganda film and were asked to get it. Navy especially was placed on the home audience, for the Committee's mission covered all phases of propaganda work. For films were recommended for posters, advertising, "four minute men" (two-minute local speakers in all American communities), Youth, American minority groups and the foreign language press, women's organizations, information bureaus, syndicated columns, and cartoons. For American political future industry was employed in a variety of domestic and foreign distribution of American propaganda. Foreign even-ings, devoted to the propaganda film, found that the American producers would not supply any future production. It was really an exaggeration to say that no special machinery had to be built up for the conduct of operations. The major task was not one of coordination and guidance. The extent of voluntary cooperation was amazing. The Propaganda Division commended its services to any writer it chose to call, and it had ready access to over three thousand of the leading distributors of the country. Novelists, essayists, and the publisher, without payment, worked in the production of articles for syndicated distribution. The objective of the Division of Political Warfare was to get the war to the people and to spread it.

acceptable newspaper style not only the story of the war but also the "spirit that was back of the whole adventure." The stories reached a circulation of twelve million a month. Of the seventy-five million pamphlets that were distributed, three quarters were sent out on request. Similarly, American painters, sculptors, designers, poster men, illustrators, and cartoonists were "mobilized on a volunteer basis." The foreign-language press was kept informed through the efforts of several hundred volunteer translators.

Through teachers' institutes, summer sessions, and educational organizations, the school was reached. Twice a month, a sixteen-page paper was issued to every one of the five hundred and twenty thousand teachers in the United States. It gave to the schools the needs and messages of government in concise and usable form, and it provided the government a direct medium for reaching the twenty million homes represented in the schools.

The creation of the "four minute man" was another effective device. No less than 75,000 speakers volunteered in 5,200 communities of the United States. They spoke chiefly in moving picture houses, but, later, this area was extended to include Sunday schools, churches, lumber camps, colleges, lodges, and women's clubs. Within a period of eighteen months, they made about a million speeches and reached some four hundred million people.

accessible newspaper files not only the body of the war but also the "back" and back of the whole education. The school reached a circulation of twenty million a month, of the twenty-five million pamphlets that were distributed, three quarters were sent out on request, directly, indirectly, can printers, typists, designers, poster men, illustrators, and cartoonists were employed on a voluntary basis. The foreign-language press was kept informed through the efforts of several hundred volunteer translators.

Through teachers' institutes, summer sessions, and educational organizations, the school was taught. Twice a month, a fifteen-page paper was issued to every one of the five hundred and twenty thousand teachers in the United States. It gave to the schools the needs and messages of government in concise and usable form, and it provided the government a direct medium for reaching the twenty million homes represented in the schools.

The creation of the "four minute war" was another effective device. We lost then 75,000 speakers volunteered in 2,500 communities of the United States. They spoke chiefly in saving picture houses, bars, clubs, and other places, extended to include Sunday schools, churches, junior groups, colleges, lodges, and women's clubs. Within a period of eighteen months, they made about a million speeches and reached some four hundred million people.

Nor was the potential of the advertising industry ignored. The large organizations representing advertising agencies, advertising clubs, and business papers were requested to name a board of control that would "mobilize the advertising forces of the country." Advertising space of various periodic publications having a total circulation of about 549,000,000 was purchased by advertisers of merchandise or contributed by the publishers without charge and turned over to the state. The International Association of Display Men donated display resources in six hundred cities. Sixty-thousand patriotic window displays could be timed exactly to supplement the campaigns in periodicals.

We were fighting for ideas and ideals, and somebody who realized that, and knew it, had to say it and keep on saying it until it was believed. That was a part of the function of the Committee on Public Information. . . . It was this unseen but persuasive and unending flood of ideas that aroused a correct apprehension of the true spirit and idealism of America in the war.¹⁰

Many in Congress did not share this evaluation by the Secretary of War. The Committee was the subject of bitter and continuous attack, not only for its activities in this country but also for its overseas operations. There were ugly accusations of partisanship, dishonesty, inaccuracy, and inefficiency. Congress explored Mr. Creel's background

¹⁰Creel, op. cit., pp. xiv-xvi; Foreword by Newton D. Baker.

has not the potential of the advertising industry. The large organizations representing advertising agencies, advertising clubs, and business papers were requested to form a board of control that would "define the advertising forces of the country." Advertising goods and services provided information having a social dimension as about 1970, 1971 was produced by advertisers of numerous items in contrast to the publisher's without charge and the United States to the world. The International Association of Display has concerned display resources in the business district. Many prominent national window displays could be used to present an advertisement the advertiser is responsible.

we were fighting for ideas and ideals, and nobody who realized that, and gave it, has to say it and have on saying it what it was believed. That was a part of the function of the Committee on Public Information. It was this unusual but necessary and amazing flood of ideas that aroused a correct apprehension of the true spirit and idealism of America in the war.

may in Congress his new share this resolution by the Secretary of War. The Committee was the subject of this and continuous attack, not only for its activities in this country but also for its overseas operations. These were very accusations of parasitism, dishonesty, inefficiency and ineffectiveness. Congress explored Mr. Clegg's background

¹⁰Comai, op. cit., pp. 214-25; followed by Gordon &

to study his writings and political thought. As the months passed, the attacks became more bitter. Additional allegations were developed charging that the program was infiltrated by spies and saboteurs--a charge to be echoed a generation later against a successor to the Creel Committee. Part of the resentment manifested was grounded in the very heavy emphasis--almost blatant--directed at the home audience. Creel, as a representative of the administration in power, was propagandizing the American people. This situation was inevitably viewed with alarm (and perhaps with some reason) by the minority party, as well as by a number of the members of the majority party, in Congress.

The purely technical side of the work was done well but at the disastrous cost of over-shooting national commitments. "The conquering idea of justice and freedom as expressed in American idealism" and the heated propaganda of "making the world safe for democracy" were discredited at home and abroad. America emerged from the war disappointed and with the definite bad taste of its own soured propaganda in its mouth. In the clear, ever-penetrating light of hind sight, a less boisterous, a more modest, a more calculated propaganda effort might have helped forestall certain attitudes which, in a matured form, contributed to the advent of World War II.

These difficulties also graphically represent the

to study his writings and political thought. At the same time, the United States was also a country of immigrants. Additional immigrants were brought in during that time and were also utilized by the United States--a country in its infancy. Protection laws against a monopoly in the United States. Part of the movement resulted was provided in the way heavy emphasis--almost almost--placed at the time and time. Thus, as a representative of the administration in power, was responsible for American people. This situation was absolutely vital with them and perhaps with some extent by the American people as well as by a number of the members of the majority party in Congress.

The country remained with the war and was well into the disastrous cost of war--including additional economic costs. "The American idea of justice and freedom as expressed in American society" and the United States of America the world was too democratic" were discussed in some and abroad. America emerged from the war disappointed and with the belief and sense of its own social progress in its world. In the clear, very-convincing light of that light, a new balance, a new order, a new relationship between the right and right have helped to create a certain order. Such order, in a limited form, contributed to the success of World War II.

These principles also graphically represent the

repercussions to be experienced from the development and annunciation of national policy objectives which are beyond the State's capacity to implement. Wilson's Fourteen Points Speech was made, in part, upon Creel's request for a clear enunciation of United States peace objectives in order to create dissension between the Bolsheviks and the Imperial Germans at the Brest-Litovsk Peace Conference.¹¹ Tactically, the speech provided the operators on the spot with the high-level support necessary to take bold and aggressive propaganda action. As a psychologically significant annunciation, the Fourteen Points are regarded as being on a par with the Declaration of Independence and the Emancipation Proclamation with respect to the clear, deep appeal voiced, in the name of universal justice and natural law, to the democratic conscience of mankind. Strategically, it marked a colossal venture towards ends, the means for the achievement of which were not even available at the time of promulgation. Psychological operations grounded on such a policy can be disastrous.

In both the formulation and annunciation of the Fourteen Points and in the conduct of psychological war, the United States was involved in matters which were operationally and philosophically new and advanced by several orders of

¹¹Edgar Sisson, One Hundred Red Days: A Personal Chronicle of Bolshevik Revolution (New Haven: Yale University Press, 1931), p. 187.

representation to be expected from the development and
 announcement of national policy objectives which are beyond
 the state's capacity to implement. Wilson's Trustees believe
 French was right, in fact, when Gress's request for a clear
 enumeration of United States goals objectives in order to
 create a distinction between the objectives and the tactical
 means to the ends. Wilson's Trustees¹¹ tactically,
 the speech provided the cooperation on the spot with the high-
 level support necessary to back both the necessary program
 action. As a psychologically significant announcement, the
 Trustees believe the request is being on a par with the
 Declaration of Independence and the American Revolution
 with respect to the state, that speech is being in the name of
 universal justice and natural law, to the democratic conscience
 of mankind. Accordingly, it is a constant reminder to
 each man, the state for the achievement of which we are not
 even capable at the time of proclamation. Psychologically
 operations proceed on such a basis can be disastrous.
 In both the revolution and the American Revolution, the
 French believe and in the conduct of psychological war, the
 United States was involved in matters which were operationally
 and psychologically not and assessed by several orders of

¹¹ Wilson's Trustees, One Hundred and Days: A Personal
 Chronicle of the Wilson Revolution (New York: The Wilson-
 Trustees Press, 1931), p. 107.

magnitude beyond any operations heretofore attempted. Inexperience, naiveté, unrestrained idealism, all of these contributed to the failure. America had forgotten that beyond the war lay a peace which would be as grim and difficult to win as the war. The Federal Government had won wars, but it had never been involved in anything that remotely resembled the approaching peace conferences. It had never conducted psychological warfare on the scale attempted in World War I. In both cases, the government had advanced far beyond any of its experience. The classic American approach to the problem had little basis of fact from which to project forward for a solution. The failure may have been tragic, but it was not shameful. World War I was to be the last of all wars; perhaps Wilson and Creel believed it themselves.

VI. PSYCHOLOGICAL WARFARE IGNORED BETWEEN THE WARS

On the thirtieth of June, 1919, the Committee on Public Information, in the pained words of Creel, "was wiped out of existence . . . by action of Congress." The work of the Committee had been discontinued months before and only an orderly liquidation was in progress. It was this liquidation that Congress sought to interrupt and confuse. No one was left with authority to rent a building, employ a clerk, transfer a bank balance, or to collect a dollar. Creel's

final report was made only through the medium of a book printed by a private publisher.

The bitter battle over the "winning" of the peace led to complete disillusionment when it became apparent that the peace had not been won at all. Once more, America turned its energies inward. The experience of the Creel Committee received practically no attention and little reference was directed to the lessons learned. The Army War College files reveal that only two research papers were written on the subject from 1919 to 1929, and no officer was assigned between 1925 and 1935 to the full-time study of the problems of psychological warfare.¹² This manifestation of reluctance on the part of the military to accept psychological warfare was widespread and existed in every department and agency of the government to a greater or lesser degree. Consequently, when World War II arrived, the United States was too busy to devote the time necessary to plan and organize intelligently. The thinking on the nature of the organization required for effective operations in psychological warfare was neither clear nor consistent. The decisions were, once again, ad hoc. The men who made them were, in many cases, unfamiliar with, or indifferent to, the instrument they were to use and the nature of its relationship to the already-established

¹²Linebarger, op. cit., p. 77.

final report was submitted through the middle of a long
 period by a private publisher.
 The subject matter of the "Review" of the same year
 is completely different from the previous report, and the
 results are not only more complete, but also more
 interesting. The explanation of the great difference
 between the two reports is that the first report was
 written by the second author, the first author being
 dead, and only two research papers were written of the
 subject from 1919 to 1929, and no other was assigned be-
 tween 1919 and 1929 to the following study of the progress of
 psychological science.¹² This investigation of science
 in the past of the military or society psychological science
 was attempted and failed in every department and agency of
 the government as a whole as far as the government,
 even the War Department, has failed to make any way to
 know and know something in this and organic intelligence.
 The training of the service of the organization revealed for
 extensive operations in psychological science was not
 clear and dominant. The decision was made to make a
 new and more complete, in every way, including the
 on individual for the first time, that was in the first
 nature of the relationship to the individual.

instruments of state policy. At that time, the Government literally did not know what it was getting into when it undertook psychological warfare. News still appeared to be the main prop and little time was wasted on other considerations. Yet this was news as the term was understood by the American press. The importance of selecting, explaining, and interpreting that news was not always grasped, even by those concerned with distributing it. Before the war, as well as after the Government entered the field, private American news and publishing agencies continued to engage in operations which had the effect, if not the intention, of propaganda. The Office of War Information (OWI) could scarcely have reached the audience of the Time-Life-Fortune group and the Reader's Digest, both of which achieved global coverage during the course of the war. The unwitting propaganda turned out by such sources possessed a quality no Government information program had--a readership which was unmistakably voluntary, obtained by the appeal of authentic interest and entertainment.

VII. ORGANIZING FOR WORLD WAR II

On Sunday, December 7, 1941, the task of disseminating propaganda to foreign audiences was assigned to two emergency agencies: The Office of the Coordinator of Inter-American Affairs (CIAA) which confined its activities to

statements of state policy. At that time, the Government
literally did not know what it was getting into when it
initiated psychological warfare. How easily reported to be
the main group and little time was wasted on other considera-
tions. Yet this was not at the time was understood by the
American press. The importance of collecting, explaining,
and interpreting that news was not always grasped, even by
those concerned with disseminating it. Before the war, it
was not clear for Government spokesmen that the United States
American news and publishing agencies continued to engage in
operations which had the effect, it was the intention, to
propaganda. The Office of War Information (OWI) could
sincerely have stated: the audience of the Time-Life Fortune
groups and the Reader's Digest, both of which achieved global
coverage during the course of the war. The unbridled fan-
gled turned out by each sector possessed a quality no
government information program had a relationship which was
constantly voluntary, obtained by the spirit of authentic
interest and entertainment.

VII. DEPARTING FOR WORLD WAR II

On January, December 14, 1941, the task of disseminat-
ing propaganda to foreign audiences was assigned to two
emergency agencies. The Office of the Coordinator of Inter-
national Affairs (CIA) which continued for several years

developing good inter-American relations, and the Coordinator of Information (COI) which operated in the rest of the world.

The Office of the Coordinator of Inter-American Affairs (CIAA) had been created on 16 August 1940, under the direction of Nelson Rockefeller. The information aspects of the CIAA's program was regarded as an integral part of its general cultural and commercial relations program which was carried out in close cooperation with the Department of State.

The Office of the Coordinator of Information (COI) had been established by a military order of President Roosevelt on 11 July 1941. It was assigned two major functions: the coordination of intelligence collection and analysis from all sources, including the armed forces; and the transmission of information abroad to areas outside Latin America. The second of these two missions was not clearly stated in the order establishing COI. Although it was not specifically stated in the order, it was clearly understood by the Coordinator, William J. Donovan, and the President that a Foreign Information Service (FIS) was to be established as an integral part of COI.¹³ This service was

¹³William E. Daugherty, "US Psychological Warfare Organizations in World War II," A Psychological Warfare Casebook, William E. Daugherty and Morris Janowitz (eds.) (Baltimore: The Johns Hopkins Press, 1958), p. 127.

developing good inter-ethnic relations, and the Council-
 of Information (COTI) which operated in the area of the
 Council.

The Office of the Coordinator of Inter-American
 Affairs (CIAA) had been created on 18 August 1940. Under the
 direction of Nelson Rockefeller. The information aspects of
 the CIAA's program was regarded as an integral part of its
 general cultural and educational relations program which was
 carried out in close cooperation with the Department of
 State.

The Office of the Coordinator of Information (COI)
 had been established by a military order of President
 Roosevelt on 11 July 1941. It was assigned the major func-
 tions: the coordination of intelligence collection and
 analysis from all sources, including the armed forces; the
 dissemination of information abroad to secure outside
 public opinion. The second of these two missions was not
 clearly stated in the order establishing COI. Although it
 was not specifically stated in the order, it was clearly
 understood by the Coordinator, William G. Donovan, and the
 President that a Foreign Information Service (FIS) was to be
 established as an integral part of COI.¹⁷ This service was

¹⁷William G. Donovan, "The Psychological Warfare
 Organization in World War II, A Psychological Warfare Case-
 Book, William G. Donovan and Walter J. Donovan, 1945, p.
 127.

directed by the President not to engage in domestic information activities.¹⁴

Robert Sherwood was appointed as the director of FIS with principal headquarters established in New York City. In accordance with its mission, this service, which from the very beginning was virtually an autonomous agency, undertook to spread the gospel of democracy and to explain the objectives of the United States throughout the world (except, of course, in Latin America). Unfortunately, the early radio scripts were poorly checked; there was chaos in the matter of policy; little policing was possible; and the output reflected the enthusiasm of whatever individual happened to be near the microphone.

VIII. THE LACK OF CENTRALIZED GUIDANCE

The FIS early encountered a pattern of difficulty that would plague all the information programs. From the earliest World War II efforts, President Roosevelt's advisers appeared to be opposed to central direction of any information program. The inevitable result was disunity in the voices that undertook to set forth our position to the

¹⁴James Paul Warburg, Unwritten Treaty (New York: Harcourt, Brace and Co., 1946) contains this document as well as the other major documents revelant to the conduct of American Psychological Warfare in World War II.

directed by the President not to engage in domestic interest-
less activities.¹⁴

Robert S. Wood was appointed as the Director of the
with principal headquarters established in New York City.
In accordance with the mission, the service, which from the
very beginning was viewed as an economic agency, undertook
to spread the concept of democracy and to maintain the object-
ivity of the United States throughout the world. Except for
contact in Latin America, (internationally, the early radio
outlets were mostly one-way; there was communication in the latter
of which, this policy was possible; and the agency
reflected the ambivalence of whatever individual appeared to
be was the intention.

VIII. THE LACK OF CENTRALIZED GUIDANCE

The FTS early encountered a series of difficulties
that would plague all the information programs. From the
earliest world war II efforts, President Roosevelt's ad-
visers appeared to be opposed to a central direction of any
information program. The intelligence service was clearly in
the vanguard that indicated to the world our position as the

¹⁴James Earl Woodard, Unofficial Treaty (New York:
Harvard, 1960 and Co., 1961) contains this document as
well as the other major documents relevant to the country as
American Psychological Service in World War II.

world. The information agencies were not advised of political or military plans and consequently had no idea how a government agency should react to developments. Many of the tools of psychological war remained in private hands. FIS would provide information to the private American broadcasting companies, but there was no assurance that these companies would use the data, or if they used it, that they would hue to the text. Not until the time of the North African invasions was it decided that official overseas broadcast should be taken out of private hands and made the responsibility of the Government.

Although the FIS did not make an effort to find out what the major policy-formulating departments wanted done in the field of American propaganda, it would not advise these same departments on its own intentions or current operations. Consequently, the departments became uncertain of the trustworthiness and security restrictions of FIS. Since they had no knowledge or control over the FIS operation, the Army, Navy, and State Departments pursued the policy of providing the least information and no outline of national plans and policies on the theory that such action would reduce the possibility of official embarrassment.¹⁵ It was a sad

¹⁵Murray Dyer, The Weapon on the Wall (Baltimore: Johns Hopkins Press, 1959), p. 105.

world. The information agencies were not advised of policy-
ing or military plans and consequently had no idea how a
government agency should react to developments. Many of the
schools of psychological war revealed in private papers. The
would provide information to the private American press
by companies, but there was no assurance that these
companies would use the data, or if they used it, that they
would use it for the good. Not until the end of the war
American business and its officials had decided that official
business should be taken out of private hands and made the
responsibility of the government.
Although the TIS did not make an effort to find out
what the major policy-formulating departments wanted done in
the field of Russian propaganda, it would not adjust these
some departments on its own initiatives or crisis operations.
Consequently, the department's become uncertain of the first-
written and security restrictions of TIS. Since they had
no knowledge or control over the TIS operations, the Army,
Navy, and State departments missed the policy in providing
the least discussion and no outline of national plans and
policies in the theory that such action would reduce the
possibility of ethical enhancement.¹⁸ It was a sad

Johns Hopkins Press, 1950), p. 103.

commentary that the source of such vital information for psychological operations was the British Political Warfare Executive (PWE). This organization, which was an acknowledged member of the British Policy Organization, shared the information with its American counterparts in London and Washington.

IX. ADMINISTRATIVE DIFFICULTIES AND REORGANIZATIONS

The overwhelming majority of the major difficulties encountered by the American psychological warfare effort were administrative and not operational. The number of agencies involved in psychological operations literally mushroomed. A partial list included the following: The Office of Facts and Figures; The Office of Government Reports; the general information activities of the Office of Emergency Management; The Foreign Information Service and the Research and Analysis Branch of the Office of the Coordinator of Information; Military Intelligence; Naval Intelligence; the State Department; the Office of the Assistant to the President; the Office of Civilian Defense; the Office of the Librarian of Congress; the Department of Agriculture; and The Board of Economic Warfare. Thousands of words in dozens of languages were promulgated throughout the world. These were composed by personnel who had little

concludes that the source of such vital information for
psychological operations is the British Political Warfare
Executive (PWE). This organization, which was an outgrowth
added member of the British Policy Organization, worked the
information with the American counterparts in London and
Washington.

1. ADMINISTRATIVE ORGANIZATION

AND DISSEMINATION

The overwhelming majority of the major difficulties
encountered by the American psychological warfare effort
were administrative and not operational. The number of
agencies involved in psychological operations literally
counted in the hundreds. A partial list included the following: The
Office of Naval Intelligence; The Office of Government
Affairs; The General Intelligence Division of the Office of
Emergency Management; The Foreign Information Service and
the Research and Analysis Branch of the Office of the
Director of Information; Military Intelligence; Naval
Intelligence; the State Department; the Office of the
Assistant Secretary of Defense; the Office of Civil Defense; the
Office of the Assistant Secretary of Defense; the Department of
Agriculture; and the Office of Economic Warfare. Thousands
of units in dozens of languages were produced throughout
the world. These were organized by personnel who had little

if any contact with Federal policy and none with the military establishment, except for formal security. The plans at the top bore little discernible relation to the operations at the bottom. When Washington agencies wanted to find out what the broadcasts were saying, the working offices at New York and San Francisco refused--on the basis of their own security regulations--to let anyone see a word of what they were sending out.¹⁶

It is not surprising that jurisdictional disputes, tests of power, and unwillingness to cooperate were rife. Rockefeller (Coordinator of Inter-American Affairs) considered the CIAA responsible solely to the President and refused to submit his proposed operations in Latin America to the State Department or to predicate CIAA actions on the Department's approval. Sherwood did not want the State Department to have any hand in the operations of the Foreign Information Service.¹⁷

This confusion inevitably led to numerous reorganization plans, all of which recognized the need for clearly-fixed lines of administrative responsibility, better integration of planning, and a system for the coordination of output.

¹⁶Linebarger, op. cit., pp. 96-97.

¹⁷Charles A. H. Thomson, Overseas Information Service of the United States Government (Washington: The Brookings Institution, 1948), pp. 17-18.

it any contact with Federal Office, not even with the
very relationship, except for formal security. The view
at the top here little attention is given to the operations
at the bottom. When Washington officials wanted to find out
what the Government was doing, the working system at the
York and the Federal Bureau—on the basis of their own
security regulations—to let anyone see a word or what they
were wanting was.¹⁶

It is not surprising that (unintentional) disclosure
of power, and unwillingness to cooperate were also.
Kocher's (Commission of Internal Security) efforts to
keep the CIA responsible again to the President and re-
sulted in a new role proposed to him in 1954. He was
the first Government to be placed in the center of the
Government's operations. However, did not the CIA
Government to have any hand in the operations of the CIA?
Information was.¹⁷

This Commission investigation led to a new organization
and plan, all of which received the same for clarity.
First look at administrative responsibility, better than
and of planning, and a system for the coordination of output.

of the United States Government, Washington, D.C., 1954.
Investigation, 1954, pp. 1-12.

After a joint psychological warfare committee had been established under the Joint Chiefs of Staff and had failed to fulfill an effective policy-coordinating function, on 13 June 1942, the President, by Executive Order 9182, established the Office of War Information (OWI). This order was based upon suggestions contained in a memorandum on the reorganization of war-information services submitted by the Director of the Budget on 7 March 1942. Rockefeller successfully resisted the integration of the Office of Coordinator of Inter-American Affairs into a single organization engaged in foreign information work, and, consequently, the order establishing OWI left CIAA out of the new organization.

The OWI was created by the transfer of various information services, both domestic and foreign, to it. Included among the war-information agencies or services merged into OWI were the following: Office of Facts and Figures (OFF); Office of Government Reports (OGR); the general information activities of the Office of Emergency Management (OEM); and the Foreign Information Service (FIS) of the Office of Coordinator of Information (COI).

Upon merger into OWI, FIS became the Overseas Branch. The Domestic Branch was originally comprised, mainly, of the personnel transferred from OFF, OGR, and OEM. Between the two branches was interposed a Program Planning and Review

[illegible]

Board to provide the horizontal lines of communication and coordination.

The Office of Coordinator of Information (COI), shorn of its FIS, was transformed into the Office of Strategic Services (OSS) under which name three major functions were assigned: (1) continuation of scholastic and informal intelligence; (2) black propaganda operations (authorized in March, 1943); and (3) subversive operations in collaboration with regular military authority. The OSS, led by Colonel Donovan, was made an agency of the Joint Chiefs of Staff (JCS). It was unfortunate that the order creating OWI did not clearly establish a division of responsibility between it and OSS for the conduct of psychological operations.

X. FACTORS INFLUENCING THE DEVELOPMENT AND CONDUCT OF PSYCHOLOGICAL OPERATIONS

From the date of OWI's establishment in June of 1942 until March of 1943, three factors influenced the conduct of psychological operations and were to be the bases for the final form of the organization that would at last evolve. First, the overseas activities of both OWI and OSS were vaguely defined. The Overseas Branch of OWI continued to function virtually as an autonomous unit until mid-1943. The Domestic-Information Activities of OWI were dominant. Second, the units comprising the developing psychological

board to provide the essential link of communication and coordination.

The Office of Coordination of Information (OCI), born of the VNA, was established into the Office of Strategic Services (OSS) under which name three major functions were assigned: (1) coordination of technical and internal intelligence; (2) liaison operations; and (3) liaison operations in collaboration with the VNA and the OSS. The OCI, led by Colonel John Edgar Hoover, was made an agency of the Joint Chiefs of Staff (JCS). It was authorized to coordinate activities of the OCI and was given the function of psychological operations.

X. FACTORS INFLUENCING THE DEVELOPMENT AND

CONCEPT OF PSYCHOLOGICAL OPERATIONS

From the date of OCI's establishment in June of 1945 until March of 1949, three factors influenced the conduct of psychological operations and were to be the basis for the final form of the organization that would be last revised. First, the overseas activities of both the VNA and OSS were largely defined. The Overseas Branch of OCI continued to function virtually as an autonomous unit until mid-1949. The Domestic-Information Division of OCI was reorganized. Second, the units comprising the developing psychological

warfare organization--OWI, OSS, and CIAA--were all rent with inter-agency as well as intra-agency disputes. Third, while the major efforts of the top echelon leaders in OWI were largely concerned with the domestic program, OSS developed far-reaching plans for the conduct of psychological warfare in connection with the then forthcoming military campaigns. These plans, however, were not accepted by Robert Sherwood--Chief of the Overseas Branch, or Elmer Davis, Director of OWI.¹⁸

XI. ATTEMPTS AT COORDINATION

The compartmentalized nature of the various agencies prevented any one of them from knowing what the others were planning or doing. In the early days of the OWI, a War Information Policy Committee was established. It met only three times! At the first meeting, either the Director or Assistant Secretaries of such agencies and departments as CIAA, the War Production Board, War, and Navy were present. The Department of State sent only its Public Relations Officer. At the second meeting, the War and Navy Departments sent their opposite numbers to the representative of the State Department. At the third meeting, the representatives were all information chiefs, none of whom were empowered to make policy. The committee never reconvened.

¹⁸Daugherty, op. cit., p. 128.

writing organization--DIA, OGA, and CIA--were aligned with
inter-agency as well as intra-agency disputes. Third, while
the major efforts of the top command leaders in 1961 were
largely concerned with the defense program, the development
for planning plans for the conduct of psychological warfare
in connection with the then forthcoming military campaign.
These plans, however, were not accepted by Robert Kennedy--
Chief of the Central Intelligence Agency, the former Director of
CIA, 18

II. ATTEMPTS AT COORDINATION

The centralized nature of the various agencies
prevented any one of them from knowing what the others were
planning to do. In the early days of the CIA, a War
Information Policy Committee was established. It had only
three members: the first member, Chief of the Division of
Intelligence Research, the second member, Chief of the Division of
Intelligence Analysis, and the third member, Chief of the Division of
Intelligence Operations. The Department of State was only the
victim. At the second meeting, the War and Navy Departments
sent their respective members to the representative of the
State Department. At the third meeting, the representatives
were all informed of the plans of the other agencies to
take policy. The committee never convened.

As a very interested bystander, the Military Branch of the Government had made an early attempt to lend continuity by the establishment of the Joint Psychological Warfare Committee (JPWC) within the structure of the Joint Chiefs of Staff (JCS). Its functions were defined as:

. . . to initiate, formulate and develop psychological warfare plans . . . [and] under the direction of the Joint Chiefs of Staff committee to coordinate psychological warfare of other US governmental agencies and to collaborate with interested nations to the end that all psychological warfare is in accord with approved strategy.¹⁹

This was an ambitious undertaking in the light of the intense rivalries that existed. Very little ever came from the JPWC, and after the establishment of OWI this organization refused to cooperate with JPWC. By late 1942, JPWC ceased to be active and was finally abolished by the JCS. Following this abolition, no JCS committee possessed or attempted to exercise any consistent responsibility for psychological warfare operations.

In December, 1942, the JCS tried once again, this time to resolve the conflict between OSS and OWI in view of the first extensive United States military operations of the war. An order was issued stating that OSS was to have complete authority "to plan, develop, coordinate and execute the military program of psychological warfare." As a

¹⁹Cited in ibid., p. 130.

consequence, both the head of OWI, Mr. Davis, and the head of CIAA, Mr. Rockefeller, appealed directly to the President, protesting the military usurpation of a Presidential delegation of authority.

XII. EXECUTIVE ORDER NUMBER 9312

Executive Order No. 9312 was issued on 9 March 1943 and set forth more clearly the responsibility of OWI in the overseas commands. The order stated that OWI was the designated agency to conduct foreign information and overt propaganda operations abroad, but "in areas of actual or projected military operations" all plans and projects "should be coordinated with the military plans" and would be "subject to the approval of the Joint Chiefs of Staff and to the approval of the theater Commander."

The order did not define clearly what, if any, psychological warfare functions were retained by OSS. The order did not state whether OWI or OSS had jurisdiction over subversive activities, covert propaganda campaigns, and the like, and it did little to resolve the problems of coordination between the separate agencies.

Executive Order No. 9312 was, in large measure, responsible for the character of the psychological warfare organizations that developed during the war in the overseas commands. The provision that "all plans and projects . . .

shall be subject to the approval . . . of the theater commander" was rigidly adhered to and greatly influenced the type and extent of operations conducted. The organizations everywhere were improvised and largely established on an ad hoc basis. There was relatively little interchange of information from one major military command to another. There were important differences in structure from one command to the next. Perhaps the single clear-cut element common to all was the concept that the theater Commander had final authority.

In each of the theaters, the psychological operation fell into four categories.²⁰

1. In enemy countries, to undermine and destroy the morale of the enemy population.
2. In enemy-occupied countries, to keep alive hope of liberation and stimulate resistance to the enemy forces of occupation.
3. In neutral countries, to win the moral support of the neutral population.
4. In allied countries, to counter all enemy propaganda aimed at dividing the United Nations, to promote the morale of the allies, and to foster a better understanding of the United States.

²⁰Thomson, op. cit., p. 40.

It was perfectly conceivable that a theater Commander would encounter psychological operations in all four of these categories, simultaneously. Such broad operations should involve major national policy and decision at the highest political level. However, both the OWI and the OSS were under the theater Commander's control and he, in the last analysis, was the authority--not Washington. Furthermore, whether or not either the OWI or the OSS carried on operations in a theater was left to the Commander's discretion. The OSS, for example, was not permitted access to the Southwest Pacific area theater, while, in the same theater, OWI, although allowed to be present, found that its weekly directive from Washington was unacceptable.²¹ In the South Pacific Command, OSS and OWI personnel were refused clearance for operations. No formal provisions were ever made in this area for a psychological warfare planning staff; in fact, it was just five days before the surrender of Japan that the Central Pacific Command reached the decision that psychological warfare was a sufficiently potent support weapon to deserve the status of a special headquarters branch. The omnipotence of the theater Commander within his purview was matched by the refusal of the agencies to accept his supremacy in matters extending beyond his theater.

²¹Dyer, op. cit., p. 112.

It was generally recognized that a theater commander

would encounter psychological opposition in all four of

these categories, simultaneously. Such broad opposition

should involve major national policy and decision at the

highest political level. However, both the GWT and the CBS

were under the theater commander's control and he, in the

last analysis, was the authority--not Washington. Therefore,

more, defined or not within the GWT or the CBS carried on

operations in a theater was left to the commander's discretion.

Thus, the GWT, for example, was not restricted solely to the

southeast Pacific area but, while, in the same theater,

GWT, although allowed to be present, found that its weekly

directive from Washington was unworkable.⁴¹ In the south

Pacific Command, GWT and CBS personnel were retained in the

for operations. No formal provisions were ever made in this

area for a psychological warfare planning staff; in fact, it

was just five days before the surrender at Japan that the

Central Pacific Command reached the decision that psycho-

logical warfare was a militarily potent support weapon to

deserve the status of a special headquarters command. The

consequence of the theater commander's decision was

reflected by the removal of the agencies to support him

primarily in various operations beyond his theater.

XIII. SECURITY AND PLANNING FOR PSYCHOLOGICAL WARFARE

One of the most vexing problems drawing from this administrative "gordian knot" was that of the vicious circle established between suspicion, distrust, and security. Clear-cut authority, judgment, discretion, and a broad understanding of the interrelationship between the proper balance of security and information are factors entering into the decision to disclose knowledge. If the planners responsible for the development of psychological operations are not informed of national policy, then there can be no possibility of effective planning and, on occasion, the political repercussions can be of tremendous import.

OWI was not informed about the forthcoming landings in North Africa, even though its members were to participate; of even greater significance was the fact that our psychological planners were confronted by the Hiroshima and Nagasaki nuclear detonations with no "forewarning and had no chance to plan what should be done to maximize favorable effects and to offset bad ones; nor was there any plan offered by the leaders."²² Effective psychological warfare demands that national plans and operations be known to, at least, the senior responsible official of the psychological

²²Thomas, op. cit., pp. 364-365.

III. SECURITY AND PLANNING FOR

TECHNICAL SERVICES

One of the most serious problems arising from this

administrative "gordon knot" was that of the various areas

administered under a single, unified, and security.

Clear-cut authority, judgment, discretion, and a broad scope

of planning of the administrative system and the various

of security and discretion and security arising from the

decision to assist knowledge. It has become a responsibility

for the development of psychological operations and not

informed of national policy, from there can be no possibility

of effective planning and, on occasion, the political rep-

resentation can be of tremendous impact.

One can not fail to see the tremendous impact

in North Africa, even though its members were to participate

of even greater significance was the fact that our people-

logical planning were supported by the military and

Nagasaki nuclear operations with an "forwarding" and had no

chance to plan what would be done to maintain favorable

efforts and to offset bad ones; nor was there any plan

offered by the leaders.¹² Effective psychological warfare

demands that national plans and operations be done so, at

least, the senior responsible officials of the psychological

warfare agency. Without this knowledge, it is impossible to explain and interpret intelligently. There is always present the danger that what may be said because of ignorance will be proven false by events. If this truism were even recognized, it did not govern United States psychological operations in World War II.

XIV. TOP LEVEL ATTITUDES

It is difficult to explain this American failure to organize effectively. Probably the single most important answer lies in the complete lack of interest in psychological warfare displayed by the majority of top-level American officials responsible for the policies and conduct of the war. Following an interview with President Roosevelt, one author wrote:

It was a curious fact--and I had confirmation of it later--that the President, who established the OWI, never knew what it was doing and sometimes, apparently, confused it with the Office of Censorship. He had been opposed to the creation of a propaganda service and had established OWI with considerable reluctance, under pressure from his advisors, whose primary aim was to provide an adequate flow of information to the American public. Once the organization was established, he did not want to be bothered with it. In his own right Roosevelt was a great propagandist . . . but he did not understand the systematic use of propaganda in total war.²³

²³Wallace Carrol, Persuade or Perish (Boston: Houghton, 1948), p. 7.

warfare agency. Without this knowledge, it is impossible to explain and interpret intelligently. There is always great danger that one may be said because of ignorance will be proven false by events. If such claims were even recognized, it did not prevent United States psychological operations in World War II.

IV. CONCLUSIONS

It is difficult to explain this American failure to organize effectively. Presumably the single most important factor lies in the complete lack of interest in psychological warfare displayed by the majority of top-level American officials responsible for the policies and conduct of the war. Following an interview with President Roosevelt, the author stated:

It was a curious fact--and I had confirmation of it later--that the President, who consulted me often, never knew that I was doing and teaching, especially, concerned with the Office of Communications. He had been opposed to the creation of a propaganda service and had rejected the OWI only because, in his opinion, under pressure from his advisors, I was not providing an adequate time of the information to the American public. Once the system was established, he did not want to be bothered with it. In his own right Roosevelt was a great propagandist. . . . But he did not understand the systematic use of propaganda in total war.

The same author goes on to add that "Cordell Hull knew even less than the President about OWI and cared about as much." It is not surprising that American psychological operations ended the war never having been properly organized or coordinated as a national instrument and never having smoothly functioned as one of the nation's policy tools for the conduct of international affairs.

XV. POST WORLD WAR II DEVELOPMENTS

Two days prior to the formal surrender of Japan, on 31 August 1945, President Truman issued Executive Order No. 9608 which established an Interim International Information Service (IIIS) in the Department of State and transferred to it the overseas information functions of OWI and the information activities of CIAA. "The nature of present day foreign relations," he stated, "makes it essential for the United States to maintain informational activities abroad as an integral part of the conduct of our foreign affairs."²⁴ The Order provided for the liquidation of OWI and IIIS by 31 December 1945. The Secretary of State was authorized to continue within the Department such foreign information functions as he considered necessary, to abolish any he thought undesirable, and to eliminate any or to transfer any

²⁴Executive Order No. 9608, August 31, 1945.

The new system goes on to say that "it is well known that even today the President's Office (C-1) and certain other agencies are not equipped to handle the American psychological operations which the war have never been properly organized or coordinated as a national Government and never having been so coordinated as one of the nation's policy tools for the conduct of international affairs."

IV. POLY WORLD WAR II EXPERIMENTS

The new policy of the United States of America, as announced in August 1945, President Truman issued Executive Order No. 9808 which established an Inter-Departmental Information Service (IDIS) in the Department of State and transferred to it the overseas information functions of OWI and the Information Activities of CIAA. "The nature of present day foreign relations," he stated, "makes it essential for the United States to maintain international activities which are an integral part of the conduct of our foreign affairs."¹² The new program for the Information Service (OWI and IDIS) is announced in August 1945. The Secretary of State was authorized to continue with the program for the Information Service. "It is essential that the United States maintain such foreign information functions as are considered necessary, to maintain any or all of the information, and to eliminate any or all of the information."

¹² Executive Order No. 9808, August 11, 1945.

to other executive agencies. He was to study the entire question of continuing a foreign information program and was to recommend a solution to the President.

William Benton was appointed Assistant Secretary of State for Public Affairs and made the responsible head of the new IIIS. Despite his efforts, the program languished. Diplomats of the traditional school were unconvinced and Congress was uninterested. An Office of International Information and Cultural Affairs (OIC) was established in the Department in early 1946 as an outcome of the study requested by President Truman. Its activities remained unchanged until 1948 although its name was changed to the Office of International Information and Education Exchange (OIE). The OIE was later to split, amoeba-like, into the Office of International Information (OII) and the Office of Educational Exchange (OEX), both of which were later to be recombined into the International Information Administration (IIA). Meanwhile, in the atmosphere of the "return to normalcy" and the glow of victory, the overseas information services languished, diminished steadily, and came close to vanishing entirely.

The American people and Congress failed to appreciate the menace of Communist propaganda to American security and failed to grasp the potentialities of psychological operations as an instrument of national policy during time of

to other executive agencies. It was to study the entire
question of controlling foreign information program and was
to recommend a solution to the President.

William E. Wilson was appointed Assistant Secretary of

State for Public Affairs and was the representative head of
the new IIA. During his tenure, the program for
diplomats of the national system was announced and

Congress was informed. An Office of International

Information and Cultural Affairs (OICA) was established in

the Department in early 1955 as an outgrowth of the study.

Directed by William E. Wilson, the activities centered on
changed until 1955 when the name was changed to the

Office of International Information and Cultural Exchange

(OICE). The old was later to split, essentially, into the

Office of International Information (OII) and the Office of

International Exchange (OIE), both of which were later to be

reorganized into the International Information Administration

(IIA) essentially in the structure of the "United States

Agency" and the Office of Culture, the Overseas Information

Services (OIS), the Overseas Information, and some close to

existing entities.

The American people and Congress failed to appreciate

the needs of Communist propaganda for American security and

failed to grasp the potential of psychological opera-

tions as an instrument of national policy during the Cold

peace. There was wide opposition from United States commercial press, radio, and film media, which feared government competition abroad. Many of the most able and skilled personnel in the fields of information and psychological warfare left government service. This loss was irreplaceable.

Throughout the military establishment in Washington, staff planning activities involving psychological operations and warfare ceased with the end of hostilities. Not until June of 1950 did the Department of the Army create the Office of the Chief of Psychological Warfare as a special staff section. The Department of the Air Force later established a Psychological Warfare Division within the Air Force's Directorate of Plans. The Navy subsequently assigned the task to a branch of the Strategic Plans Division of the Office of the Chief of Naval Operations.

XVI. THE INFORMATION AND EDUCATION

EXCHANGE ACT OF 1948

By 1948, the chill winds of ideological war were blowing out of Eurasia in such an unmistakable manner that Congressional action resulted in the United States Information and Education Exchange Act of 1948, Public Law 402 (The Smith-Mundt Act). This act directed the Secretary of State

to provide for the preparation and dissemination abroad of information about the United States, its people, and its policies, through press, publications

radio, motion pictures, and other information media, and through information centers and instructors abroad.

The act also provided for

an educational exchange service to cooperate with other nations in (a) the interchange of persons, knowledge, and skills; (b) the rendering of technical and other services; and (c) the interchange of developments in the field of education, the arts, and science.²⁵

The educational exchange concept was subsequently given substance with the enactment of the Fulbright Act, which provided that funds derived from the sale abroad of surplus war material should be used to finance the exchange of persons. The administration of the Smith-Mundt Act was placed under the International Information Administration (IIA) of the Department of State.

The Smith-Mundt Act remains the basic legislation for the conduct of the United States information program today. The concept in 1948 was defensive and unrealistic. It was based on the assumption that if other people understood us they would like us, and, if they liked us, they would do what we wanted them to do. This concept has not been completely laid to rest in 1964.

The objective was interpreted once again, as a gigantic advertising campaign, carried on, for the most part, by the broadside telling of America's story. The Secretary of

²⁵Cited by Stephens, op. cit., p. 38.

radio, motion pictures, and other information media, and through information centers and instructors abroad.

The Act also provided for

an educational exchange service to cooperate with other nations in (a) the interchange of persons, knowledge, and skills; (b) the advancement of technical and other services; and (c) the interchange of developments in the field of education, the arts, and science.²⁵

The educational exchange concept was subsequently given substance with the enactment of the Fulbright Act, which

provided that funds derived from the sale of surplus war material should be used to finance the exchange of persons. The administration of the Fulbright Act was placed under the International Information Administration

of the Department of State.

The Fulbright Act remains the basic legislation for the conduct of the United States Information program today.

The concept in 1948 was tentative and unrealistic. It was based on the assumption that if other people understood us they would like us, and if they liked us, they would do

what we wanted them to do. This concept has not been completely valid so far in 1964.

The objective was interpreted once again, as a sign-

ific revolutionary campaign, carried on, for the most part, by the provision of America's story. The necessity of

State had been directed by Public Law 402 to "reduce such government activities whenever corresponding private information dissemination . . . [was] found to be adequate."

There followed extensive contracts with domestic broadcasting companies for an overseas broadcasting service to present to the world "a full and fair picture" of the United States. Very shortly thereafter, Congressional concern over scripts, art exhibits, and the general concept of operations developed and threatened, by 1950, to cancel the entire program.

By 1950, however, the international arena was so troubled that the United States was thoroughly awakened to the Soviet threat. There could be no disagreement on the need for a program, and President Truman was given a record appropriation of \$121,000,000 to carry on a "campaign of truth" against communism. However, the, apparently inevitable, bureaucratic struggle was raging behind the scenes. In addition to the International Information Administration (IIA), the Technical Cooperation Administration (TCA), the Economic Cooperation Administration (ECA), the Mutual Security Administration (MSA), the three Armed Services, and the Department of Defense all operated, at one time or another, in the international field and possessed their own overt international information services. Many foreigners preferred the Armed Forces Radio Service (AFRS) newscasts over those of the Voice of America in the conviction that

what the United States Government said to its own citizens would be free of propaganda. Thus, while AFRS broadcast all over the world for the entertainment and enlightenment of American servicemen, large foreign audiences could and did eavesdrop.

XVII. POST WORLD WAR II EFFORTS TOWARDS COORDINATION

In the years following World War II, there had been sporadic efforts between the various Departments towards the more effective integration of their activities; however, the concept of all these efforts was that of the coordination of separate, independent, component parts. Originally, this work began at the direction of the State-War-Navy Coordinating Committee (SWNCC). It continued under the State-Army-Navy-Air Force Coordinating Committee (SANACC). The direction of action was continued by the later Interdepartmental Foreign Information Organization (IFIO) which was the policy-making board for the Interdepartmental Foreign Information Staff (IFIS). After the IFIS came the Psychological Operations Coordinating Board (PCB).

Finally, early in 1950, an official peacetime role, in name, was assigned to psychological warfare with the creation of the Interdepartmental Psychological Operations Coordinating Committee in the Department of State. Through

and the United States Government will be in the position
 to be free of propaganda. Thus, while 1954 represents a
 year of the world for the establishment and development of
 American democracy, 1954 is also a year of peace and the
 American people.

WILL 1954 BE A YEAR OF TOWARD COORDINATION

In the year following World War II, there had been
 special efforts between the various departments towards the
 more effective integration of their activities; however, the
 concept of all these efforts was that of the coordination of
 separate, independent, component parts. Originally, this
 work began at the direction of the Secretary-General
 the Committee (SAC) in 1945. It continued under the 1945-1946
 Navy-Air Force Coordination Committee (SAC). The 1946-1947
 Joint Chiefs of Staff was continued by the later Interdepartmental
 Foreign Relations Organization (JFRO) which was the policy-
 making body for the Interdepartmental Foreign Relations
 Staff (JFRO). After the JFRO came the Psychological Coordi-
 nating Committee (JFRO).
 Finally, early in 1950, an official meeting took
 place, was followed by psychological warfare with the
 creation of the Psychological Warfare (JFRO) Committee
 Coordinating Committee in the Department of State. Through

this device, the Armed Forces had hoped to have a direct voice in advising the Secretary of State on the development and conduct of an integrated, current foreign information program, and to plan for full-scale use of psychological warfare in the case of hostilities. The Department of State evidenced a reluctance to accept much advice from the military, and the committee, contrary to the position taken by its military members, prepared a plan for a psychological mechanism which was to be created when, as, and if World War III began. The Secretary of Defense, through whose office the plan was routed for approval, took strong exception--based on the representations of his military chiefs. In a letter to the President, it was forcefully argued that such a mechanism should be created not when the war was actually upon the nation but immediately. This proposal found no support within the Department of State.

The result of this divergence was the creation, by Executive Order, on 20 June 1951, of the Psychological Strategy Board which placed psychological warfare on an even higher plane. This was to be a high-level planning and coordinating body responsible to the National Security Council. Its mission was to plan long-term psychological approaches to the nation's problems, and to help influence opinions, attitudes, and behavior abroad in support of

This action, the United States had hoped to have a direct
 voice in obtaining the Secretary of State on the development
 and conduct of an integrated, scientific foreign intelligence
 program, and to plan for this state was not psychological
 warfare in the case of hostilities. The Department of State
 welcomed a reference to accept such advice from the mili-
 tary, and the Committee, contrary to the position taken by
 the military members, prepared a plan for a psychological
 mechanism which was to be created when, at, and in which was
 III pages. The members, at present, cannot know what
 the plan was meant for, especially, took strong exception—
 based on the recommendations of the military chiefs. In a
 letter to the President, it was forcefully argued that such
 a mechanism should be created not when the war was actually
 upon the nation but immediately. This proposal found no
 support within the Department of State.

The result of this divergence was the creation by
 Executive Order, on 15 June 1951, of the Psychological Warfare
 Policy Board which placed psychological warfare on an even
 higher plane. This was to be a high-level planning and
 coordinating body responsible to the National Security
 Council. Its mission was to plan long-term psychological
 operations to the nation's interest, and to have influence

national objectives.²⁶ It was also assigned responsibility for the

formulation and promulgation, as guidance to the departments and agencies responsible for psychological operations, of over-all national psychological objectives, policies, and programs, and for the coordination and evaluation of the national psychological effort.

Regular members were the Under Secretary of State, Deputy Secretary of Defense, and the Director of the Central Intelligence Agency. Other agencies, such as the Mutual Security Administration, participated as needed. A representative of the Joint Chiefs of Staff was principal adviser. A staff was provided to do the planning and the Board's director was appointed by the President.

XVIII. THE KOREAN WAR

When the Korean War began, psychological warfare once again was called upon to contribute to the effort. The Korean experience paralleled far too closely the experience in World War II. Once again psychological operations were hampered by security, faulty intelligence, and imperfect organization. Most of the lessons that should have been learned from World War II had to be relearned. The experience

²⁶United States Congress, Senate, Overseas Information Programs of the United States, Report 406, 83rd Congress, 1st Session (Washington: Government Printing Office, 1953), p. 48.

national objectives. It was also assigned responsibility

for the

formulation and implementation, as well as the
 development and execution of the psychological
 and operational, of various national psychological
 objectives, policies, and programs, and for the
 coordination and evaluation of the national psycho-
 logical effort.

Other members were the Under Secretary of State, Deputy
 Secretary of Defense, and the Director of the Central Intel-
 ligence Agency. Other agencies, such as the National Security
 Administration, participated as needed. A representative of
 the Joint Chiefs of Staff was principal witness. A staff
 was provided to the planning and the Board's Director was
 appointed by the President.

VIII. THE BOARD

When the Board was again, psychological warfare once

again was called upon to contribute to the effort. The
 Board's experience provided for too closely the experience
 in World War II. Once again psychological operations were
 hampered by security, faulty intelligence, and improper
 organization. Most of the lessons that should have been
 learned from World War II had to be relearned. The experience

and manpower available in the United States Information Service operation in Korea prior to hostilities was almost totally ignored. The Psychological Warfare Section of the Far East Command was virtually autonomous, and the Far Eastern operation proceeded independent of political authority on many of its most urgent problems of psychological policy.²⁷ The strategic radio operation felt the lack of adequate preparatory measures in terms of organization and training.

In August of 1950, the Operations Research Office of Johns Hopkins University observed that at that date:

. . . it was assumed . . . that there were some masters of the problem, authorities who had a systematic understanding of its full scope. The growing realization that no transmissible, reliable, fundamental, true body of knowledge exists on psychological warfare demanded, and still demands, basic research on the problem so that valid operational research can be built up. The lack of a general doctrine on . . . [psychological] war is now recognized.²⁸

It should not be a source of surprise to discover that the Psychological Strategy Board floundered and failed. It shortly discovered that there was no such thing as "psychological strategy" apart from the other strategies which together comprise national security strategy. Although it

²⁷Dyer, op. cit., pp. 114-117.

²⁸Ibid., p. 114, cited from an internal memorandum of the Operations Research Office.

and equipment available in the United States. The service position in some cases to be filled was almost totally ignored. The psychological needs of the men in the command were virtually ignored, and the men's operations were treated independent of political considerations on many of the most urgent problems of psychological policy.²⁷ The strategic radio operation left the lack of adequate preliminary measures in terms of organization and training.

In August of 1950, the Operations Research Office at Johns Hopkins University observed that at that time:

... it was assumed . . . that there were some masters of the problem, individuals who had a systematic understanding of the full scope. The growing realization that no individual, reliable, fundamental, even body of knowledge exists on psychological warfare demands, and still demands, basic research on the problem so that valid operational research can be built up. The lack of a general synthesis on . . . (psychological) war is now recognized.²⁸

It should not be a source of surprise to discover that the psychological strategy Board recommended and failed. It shortly discovered that there was no such thing as "psychological strategy" apart from the other strategies which together comprise national security. Although it

²⁷ Ibid., pp. 114-115.

²⁸ Ibid., p. 114, cited from an internal memorandum of the Operations Research Office.

was recognized that the tools of foreign policy--diplomacy, military policy, economic activity, and psychological operations--were interdependent, it was not recognized that they were inseparable. It was believed that if the activities of these four instruments were "coordinated," as each proceeded with its own, independent planning and action, a unified, integrated whole would result. It is, at least, to the credit of the Board that the hermaphroditic nature of this concept came to be recognized. In its planning, the Board swung to the only plausible course of action--one which encroached upon the diplomatic, economic, and military fields of activity. Thus was precipitated a continuous series of struggles with the responsible officials who were supposed to execute the Board's plans in those fields.

The foreign information program, itself, became an increasing source of difficulty. The operation grew so large and complex that it simply was beyond the capacity of the existing organization headed by an assistant Secretary of State. Coordination between all the agencies and negotiation towards voluntary consolidation of redundant operations were attempted without success. The regular administrative mechanism of the Department of State was not designed to cope with such an arrangement. The solution lay in the establishment of the semi-autonomous International Information Administration within the State Department. The

was recognized that the basis of foreign policy—diplomacy, military policy, economic activity, and psychological operations—were interdependent, it was not recognized that they were inseparable. It was believed that if the activities of these four instruments were "coordinated," as they proceeded with its own, independent planning and action, a unified,

integrated world would result. It is, of itself, no the credit of the Board that the interdependent nature of this concept came to be recognized. In its planning, the Board swung to the only plausible course of action—and which was treated upon the diplomatic, economic, and military fields of activity. Thus was developed a composite series of strategies with the responsible officials and were supposed to execute the Board's plan in those fields.

The foreign information program, finally, became an

integrated source of activity. The operation grew so large and complex that it simply was beyond the capability of the existing organization headed by an Assistant Secretary of State. Coordination between all the agencies and organizations—power, voluntary organizations of individuals, organizations were attempted without success. The regular

administrative mechanism of the Department of State was not designed to cope with such an arrangement. The solution lay in the establishment of the semi-autonomous organizational information administration within the State Department. The

new activity was to continue to receive policy guidance from the Assistant Secretary of State for Public Affairs but was to have a free hand in operations. Dr. Wilson Compton, the Administrator, quickly found that the achievement of

semi-autonomy implies a high degree of consolidation of authorities and responsibilities which heretofore . . . [had] been widely dispersed. There . . . [was] within the Department a reluctance to accept these changes, and if not a resistance, at least a formidable inertia.²⁹

XIX. AFTERMATH OF THE 1952

PRESIDENTIAL ELECTION

Following the 1952 Presidential election, the entire United States information and psychological warfare structure became the target for searching investigations. The President's Committee on Foreign Information Activities, known as the Jackson Committee after William H. Jackson, its Chairman, was to report by the summer of 1953. A subcommittee of the Senate Foreign Relations Committee, under the Chairmanship of Senator Fulbright, initially, and subsequently, Senator Hickenlooper examined subjects related to the overseas information program. An Advisory Commission on Information, established pursuant to the Smith-Mundt Act, convened to examine the conduct of that program. Simultaneously,

²⁹Stephens, op. cit., p. 42, cited from the June 30, 1952, report of Dr. Wilson Compton to the Secretary of State.

new activity was to continue to receive policy guidance from the Assistant Secretary of State for Public Affairs and was to have a free hand in execution. Dr. Wilson composed the administration, which found that the achievement of

semi-autonomous bodies & high degree of centralization of authority and responsibility which necessitates a high degree of discipline. There is a high degree of discipline within the Department & a reluctance to accept these changes, and it is a challenge, at least a challenge to the future.

Following the 1977 Presidential election, the entire
ONASAS research information and psychological warfare programs
passed the agency for continuing investigations. The program
then's Committee on Foreign Information Activities, known as
the Research Committee after William E. Jackson, its chairman,
was so report by the summer of 1978. A subcommittee of the
Research Committee was created, under the chairmanship
of Senator Wright, initially, and subsequently, Senator
Dick Gephardt. Research subjects related to the program in-
formation program. An Advisory Committee on Information
relating to the program was also formed in
the course of this program. Additionally,

Senator McCarthy conducted his own widely-publicized investigation of the foreign information program. Except for the latter "witch-hunt," the results of the investigations, and, in particular, the findings of the Jackson Committee had far-reaching effects on the reorganization of United States Psychological Strategy and Operations.

. . . data has been available to the committee which suggests that the . . . [Psychological Strategy] Board is not effectively discharging its function. The Executive Order (June 20, 1951), creating the Psychological Strategy Board is loosely drawn. It lodges various responsibilities in the Board but limits its authority to "guidance" and "reporting" Observations of members of the committee abroad and other evidence moreover suggest that the component agencies of the board (CIA, Defense, State) are continuing to go their separate ways in matters of psychological policy.³⁰

There is no "strategic concept for psychological operations" separate and distinct from a strategic concept for gaining national aims from war We find that the "psychological" aspect of policy is not separable from policy, but is inherent in every diplomatic, economic or military action. There is a "psychological" implication in every act but this does not have life apart from the act.³¹

XX. REORGANIZING FOR PSYCHOLOGICAL WARFARE--

THE USIA

Out of the recommendations of the three groups emerged

³⁰United States Congress, Senate, Overseas Information Programs of the United States, op. cit., p. 6.

³¹Dyer, op. cit., p. 135, cited from the Report of the President's Committee on International Information Activities.

Presidential Reorganization Plan 8, approved by the 83rd Congress and made effective on the first of August, 1953. By this plan, the overseas information function was removed from the Department of State and reassigned, along with the foreign information programs of all other agencies, to a new and autonomous United States Information Agency (USIA). The Director of the new Agency was made directly responsible to the President through the National Security Council; he was to receive foreign policy guidance from the Secretary of State.

On recommendation of the National Security Council, in a directive dated 22 October 1953, the President established the basic mission of the Agency as:

to submit evidence to peoples of other nations by means of communication techniques that the objectives and policies of the US are in harmony with and will advance their legitimate aspirations for freedom, progress, and peace.³²

This mission was to be accomplished by:³³

1. Explaining and interpreting to foreign peoples the objectives and policies of the United States Government;
2. Depicting imaginatively the correlation between US policies and the legitimate aspirations of other peoples of the world;
3. By unmasking and countering hostile attempts to distort or to frustrate the objective and policies of the Government of the US;

³²United States Information Agency, Background Information (Washington: Government Printing Office, 1953), p. 3.

³³Ibid.

President's Commission Plan 2, approved by the 92nd Congress and made effective on the 1st of January, 1951. By this plan, the various information functions were removed from the Department of State and reassigned, along with the Federal Information Program of all other agencies, to a new Federal Information Agency (FIA). The mission of the new Agency was made directly responsible to the President through the National Security Council; he was to exercise foreign policy guidance from the Secretary of State.

In recommendation of the National Security Council, in a directive dated 12 October 1950, the President assigned the basic mission of the Agency as:

To provide a system of reports to the President and the Secretary of State on the activities of the various agencies of the Government and on the activities of the various agencies of the Government and on the activities of the various agencies of the Government.

This mission was to be accomplished by:

1. Obtaining and interpreting to foreign people the objectives and policies of the United States Government;
2. Repeating faithfully the correlation between the policies and the legislative aspirations of other people of the world;
3. By examining and comparing foreign systems of thought or to determine the objectives and policies of the Government of the U.S.

United States Information Agency, Background Paper - Foreign Information Program, (1950-1951), p. 2.

1950

4. By delineating those important aspects of the life and culture of the United States which facilitate understanding of the policies and objectives of the Government of the United States.

Under this mission, the USIA was to concentrate on objective, factual news reporting with appropriate commentaries, designed to present a full exposition of important United States actions and policies, especially as they affected individual countries and areas.

XXI. THE OPERATIONS COORDINATING BOARD

Pursuant to the Jackson Committee report, the President, by Executive Order No. 10483, on 2 September 1953, abolished the Psychological Strategy Board and replaced it with the Operations Coordinating Board (OCB), under the National Security Council. However, it was not until 25 February 1957, that the President issued a revised Executive Order formally placing the OCB within the structure of the National Security Council as of 1 July 1957. The members of the Board were the Under Secretary of State, the Deputy Secretary of Defense, the Director of the Foreign Operations Administration, the Director of Central Intelligence, a representative of the President (the Special Assistant for Cold War Planning), and the Director of the USIA (though not formally appointed a member of the board until the spring of 1955). The Jackson Committee had declared that "except for

4. By highlighting those important aspects of the life and culture of the United States which facilitate understanding of the policies and objectives of the Government of the United States.

Under this section, the USA was to concentrate on objective, factual news reporting with appropriate comment, designed to present a full exposition of important United States affairs and policies, especially as they affected individual countries and areas.

XVI. THE OPERATIONS COORDINATING BOARD

According to the Jackson Committee report, the President, by Executive Order No. 10483, on 1 September 1953, established the Psychological Strategy Board and related it with the Operations Coordinating Board (OCB), under the National Security Council. However, it was not until 28 February 1957, that the President issued a revised Executive Order formally placing the OCB within the structure of the National Security Council as of 1 July 1957. The members of the Board were the Vice Secretary of State, the Deputy Secretary of Defense, the Director of the National Intelligence Administration, the Director of Central Intelligence, a representative of the President's Special Assistant for Cold War Planning, and the Director of the USA through out formally appointed a member of the Board until the spring of 1957. The Jackson Committee had decided that "because the

propaganda, there are no 'psychological warfare' instruments distinct from traditional instruments of policy." In his Executive Order, the President stated the mission of the Operations Coordinating Board as follows:

The National Security Council having recommended a national security policy and the President having approved it, the Board shall (1) whenever the President shall hereafter so direct, advise with the agencies concerned as to (a) their detailed operational planning responsibilities respecting such policy, (b) the coordination of the interdepartmental aspects of the detailed operational plans developed by the agencies to carry out such policy, (c) the timely and coordinate execution of such policy and plans, and (d) the execution of each security action or project so that it shall make its full contribution to the attainment of national security objectives and to the particular climate of opinion the United States is seeking to achieve in the world, and (2) initiate new proposals for actions within the framework of national security policies in response to opportunity and changes in the situation.³⁴

Thus, it was to be the responsibility of this body to see that actions by other agencies to implement policy were taken in a coordinated manner. Furthermore, as initially conceived by the Jackson Committee and as the concept was first accepted by President Eisenhower, the purpose of this coordination was to achieve maximum psychological impact from the integrated application of all the instruments of policy. However, the OCB not only failed to bring together the opposing viewpoints held by representatives of the

³⁴United States Congress, Senate, Committee on Government Operations, Organizing for National Security, Vol. II (Washington: Government Printing Office, 1961), p. 455.

propaganda, there are no 'typological' matters, instruments distinct from traditional instruments of policy. In his Executive Order, the President stated the mission of the Operations Coordinating Board as follows:

The National Security Council having recommended a national security policy and the President having approved it, the Board shall (1) whenever the President shall have directed so clearly, advise with the Board and coordinate as to (a) their detailed recommendations, (b) the coordination of the instrumental aspects of the detailed operational plans developed by the agencies to carry out such policy, (c) the timely and coordinate execution of such policy and plans, and (d) the execution of such security action or project as that is shall make the full contribution to the attainment of national security objectives and to the peaceful attitude of opinion and United States in seeking to achieve in the world, and (e) initiate and coordinate the actions within the framework of national security policies in response to opportunities and changes in the situation.¹⁴

Thus, it was to be the responsibility of this body to see that action by other agencies to implement policy was taken in a coordinated manner. Furthermore, as initially conceived by the Jackson Committee and as the concept was first adopted by President Eisenhower, the purpose of this coordination was to achieve maximum psychological impact from the integrated application of all the instruments of policy. However, the OCB not only failed to bring together the operating agencies but by representatives of them

¹⁴United States Congress, Senate, Committee on Government Operations, Organizing for National Security, Vol. II (Washington: Government Printing Office, 1961), p. 488.

Department of State, Department of Defense, and the Central Intelligence Agency but also gradually evolved almost completely away from its initial concept as a means for facilitating the development of psychological strategy and the integrated psychological operations of psychological warfare.

The old Psychological Strategy Board had been abolished, among other reasons because it had no authority--it was limited to "guidance." Paradoxically, the OCB was created in a similar manner: it lacked authority to formulate a single, unified course when opinions differed. Its actual deliberations bore a close similarity to and paralleled the experience of its early predecessor committees (starting with the State-War-Navy Coordinating Committee) when the subject of forging an effective psychological structure was taken up. The members of the OCB were, first, departmental representatives and, second, members of a board intended to coordinate and strengthen the voice with which government speaks. It follows that any member of the board could, in effect, veto any proposed action in the field of psychological operations (or any other field, for that matter) since the chairman had no authority to proceed on majority decisions. The board had to agree as a unit. If a member objected in the name of his department, that department was able to prevent the board's achieving anything but a compromise decision.

Department of State, Department of Defense, and the Central Intelligence Agency but also gradually evolved almost completely away from its initial concept as a means for facilitating the development of psychological strategy and for integrated psychological operations of psychological warfare.

The old Psychological Strategy Group had been established, among other reasons because it had no authority--it was listed as "advisory," tentatively, the OCS was created in a similar manner. It lacked authority to formulate a strategy, unified command when operations differed, the actual deliberations bore a close similarity to and paralleled the experience of the early predecessor committees (starting with the State-Defense Coordinating Committee) when the subject of formulating an effective psychological structure was taken up. The members of the OCS were, first, governmental representatives and, second, members of a board intended to coordinate and strengthen the voice with which government speaks. It follows that any member of the board could, in effect, veto any proposed action in the field of psychological operations for any given field, for that matter, since the chairman had no authority to proceed on majority decision. The board had no equal as a unit. It was never objected in the name of its department, that department was able to prevent the board's endorsing anything but a unanimous decision.

XXII. THE SPECIAL ASSISTANT TO THE PRESIDENT
FOR COLD WAR PLANNING

A third development, stemming from the recommendations of the Jackson Committee, was the appointment of a Special Presidential Assistant to advise on matters relating to foreign public opinion. The voice of the President of the United States was the Voice of America, and his words had a powerful effect upon foreign audiences. It was, therefore, absolutely necessary that the President consider the role of public opinion in World affairs whenever he spoke. To aid in developing effective Presidential communications, the requirement for specialized assistance in the formulation of public pronouncements had come to be recognized. This was the purview of the Special Assistant for Cold War Planning who was also designated as the President's representative on the OCB. The position was first held by C. D. Jackson who was followed by Nelson Rockefeller, and thereafter, William H. Jackson. These three men had each accumulated extensive experience in propaganda and psychological operations. Planners, as well as operators, had long felt the need for ready access to the President. Before the establishment of the Special Assistant, access had been primarily through press secretaries and speech writers who, preoccupied with problems of domestic public opinion, were not always

EXIT: THE SPECIAL ASSISTANT TO THE PRESIDENT

FOR GOLD AND BLANKING

A third development, stemming from the reorganization of the Jackson Committee, was the appointment of a Special Presidential Assistant to advise on matters relating to foreign public opinion. The voice of the President of the United States was the voice of America, and his words had a powerful effect upon foreign audiences. It was, therefore, absolutely necessary that the President consider the role of public opinion in foreign affairs whenever he spoke. To aid in developing effective Presidential communications, the Department for Specialized Assistance in the formulation of public pronouncements was now to be organized. This was the function of the Special Assistant for Gold and Blanking who was also designated as the President's representative on the GOC. The position was first held by U. S. Jackson who was followed by Nelson Rockefeller, and thereafter, William H. Jackson. These three men had some accumulated experience in propaganda and psychological operations. Moreover, as well as operators, had long held the need for ready access to the President. Before the establishment of the Special Assistant, access had been extremely through press secretaries and speech writers who, preoccupied with problems of domestic public opinion, were not always

knowledgeable or sympathetic on matters of foreign public opinion. Short of placing the foreign information function in the Executive Office of the President or investing a new cabinet status department with this mission, a special Presidential Assistant seemed to offer an arrangement which should go far toward satisfying the requirement for close liaison.

The high point of the role of the Special Assistant for Cold War Planning within the OCB structure was reached early in the life of that body when this Special Assistant served as the Board's Executive Officer.³⁵ The long-term impact of the Special Assistant for Cold War Planning on the OCB mission can only be inferred from the mutation of the field of operations within the OCB of the President's representative from concern for the "climate of opinion" to a "follow-up function."³⁶ In July of 1957, with the establishment of the post of Special Assistant to the President for Security Operations Coordination, the Cold War Planning Assistant was demoted from the role of the President's representative on the OCB.

XXIII. THE OCB FAILS

By this time, however, the OCB had completely

³⁵Ibid., p. 459. On 4 November 1953, a full-time Executive Officer was appointed.

³⁶Ibid.

developed away from the 1953 concept of a sort of lens which would gather the departmental threads of potential psychological operations and focus them into an instrument of national psychological warfare. Already, it was evident that the OCB had little impact on the real coordination of policy execution. The OCB was an interagency committee which lacked command authority. It always acted by "agreement" or "concurrence." It did not "decide" or "direct" action on a document; rather it concurred in it and agreed to carry out any actions it contained. A difference of view among the OCB members which could not be resolved within the Board was referred to the respective agency heads. Failing of resolution at that level, the matter found its way to the President, either directly or through the National Security Council. Consequently, many of the most important decisions affecting the course of programs under the OCB surveillance were made outside the framework of the Board. Furthermore, the departments often bypassed the OCB, pursuing their own interpretations of policy or engaging in "bootleg" coordination through extramural means.³⁷ It appeared ever more clearly, that an interdepartmental committee cast in the organizational mold of the OCB could not be counted upon to discharge effective major responsibilities for follow through.

³⁷United States Congress, Senate, Committee on Government Operations, Organizing for National Security, Vol. III (Washington: Government Printing Office, 1961), p. 37.

developed very soon the 1953 concept of a Joint Chiefs of Staff which would give the Departmental Chiefs of Potential Policy-logical operations and would have an influence on the national policy-making process. Already, it was evident that the OCS had little impact on the real coordination of policy decisions. The OCS was an interagency committee which lacked command authority. It was not by "policy" or "coordination". It did not "decide" or "advise" action on a document; rather it coordinated it and acted to carry out any action it considered. A difference of view among the OCS members which could not be resolved within the staff was referred to the respective agency heads. Calling of operations at this level, and action taken by the staff, was usually taken care of through the National Security Council. Consequently, many of the most important decisions affecting the course of programs under the OCS surveillance were made outside the framework of the staff. Furthermore, the departments often bypassed the staff, pursuing their own independent line of policy or engaging in "policy" decisions from through external means.¹⁷ It appeared even more clearly that in interdepartmental committee work in the organizational role of the OCS could not be counted upon to achieve effective policy coordination for policy decisions.

¹⁷United States Congress, Senate, Committee on Government Operations, Investigation of National Security, Vol. III (Washington: Government Printing Office, 1957), p. 47.

XXIV. CONFUSION IN THE AREA OF POLICY GUIDANCE

One of the areas heavily scored in the three 1953 investigations was that of the confusion which existed over responsibility in the field of foreign policy. There was no clear chain of command below the President. Practice had nearly shattered the role of the Secretary of State as the President's executive agent in the field of foreign affairs. Much of the Secretary's authority had been usurped by President Roosevelt during the course of World War II. The post-war and Korean problems had resulted in the acquisition by the Joint Chiefs of Staff and the Secretary of Defense of an ever-increasing voice in foreign affairs. Furthermore, Congress had created the Economic Cooperation Administration as an independent agency with cabinet status and, by statute, gave its administrator direct access to the President.

Overseas, the confusion was even worse where the separate agencies pursued their own courses of action and interpreted United States foreign policy as they saw fit. At one time, in Paris, there were four United States representatives with the rank of Ambassador, each independent of the other three. In the foreign information field, a variety of separate and un-coordinated programs were being conducted simultaneously.

President Eisenhower restored the Secretary of State to his traditional role, stating that all other officers
